This research concludes that trust for institutions is crucial as it creates room for the people or citizens' political participation. It establishes that the level of institutional trust of the citizens' depends on their levels of participation in state activities. The higher the trust, the higher their participation and vice versa. The research also identifies three categories of citizens depending on their levels of participation or engagement. The "critical citizens" are the courageous or the active ones who have the capacity to challenge the institutions as in developed democracies (Norris 2011). The "autonomous citizens" have a high interest in politics and then engage others on political issues while the "mobilized subjects" are those with less interests in political issues who are 'persuaded, induced, or compelled by others to participate' (Logan et al. 2006, p. 14).

## Implications and Suggestions for Future Research

This research analysis implies that the two concepts are interconnected; the factors that connect them are multifaceted. Future research should consider quantitative cross-country dimension.

# Institutional Trust in Bangladesh: Determinants from Good Governance Stance

Tahmina Ferdous Tanny
Department of Public Administration, Jagannath University, Dhaka, Bangladesh

## Synonyms

Governance and public administration; Governance and trust; Institutional governance; Integrity in the public service

## Definition

Institutional trust is citizens' evaluation of public sector institutions' performance as honest, helpful, and accountable.

## Introduction

Good governance and trust intertwine in a manner that the presence of the former gives birth to the

latter; and vice versa. Trust is an indispensable element in the composition of a competent state. A competent state strives to instigate a trust culture where citizens have an equal and potential chance of making a difference in the political decision making (Sztompka 1999). This is how good governance takes place as the corollary of the trust culture (Blind 2007). Contrarily, Levi (1998) said that the role of the state determines whether its subjects would bestow trust: reflected from macroeconomic performances like higher GDP, lower inflation rate, reduced unemployment, to noneconomic performances like the governance of the state-level institutions as credible, accountable, corruption-free, and serve common interests. Irrespective of whether trust begets good governance, or comes after the good governance, the importance of both is a topical issue in governance studies.

Diamond (2007) identified three mechanisms that function to link trust and good governance: the social-civil mechanism indicates the necessity of a culture where citizens have high social trust that allows them to extend trust to the representatives of public institutions and legitimate the government, along with a vibrant civil society who acts as a mediator between citizen and government to represent aggregated interests and rational demands. The economic-efficiency mechanism addresses that a state can increase its social and political trust by resolving social issues of inequality and marginalization through safety nets and social welfare programs. The political-legitimacy mechanism implies citizens' perception/belief that the government rightfully possessing and exercising the power bestows them with political trust and the government legitimacy. Democratization tools such as decentralization, free and fair elections, efficient parliamentary process, and an independent judiciary bring the result of political legitimacy.

The leading objects of trust comprise the government, government's integrity, the electoral process, the legislative body, administration, the judiciary, the police, the military, and the outcomes (Kim 2010). Distrust in the political and representative institutions erodes support as a form of governance because citizens become less likely to pay taxes, spontaneously comply with laws and cooperate with administrative rules and regulations, and thus, produce alienation from the political process. So, the state suffers to mobilize national resources or set up a collective vision for national development (Diamond 2007); consequently, it falls into the vicious cycle of low trust – declining resources – poor perceived government performance – lower trust (Yang and Holzer 2006: 1).

In countries either developed or developing, declining trust in government is well established in literature and has been justified. Building trust is a difficult task regardless of countries but it is more difficult for countries that have limited accessibility to all sectors and concentrated in a few – the developing countries; and restoring people's trust is an equally important concern for both. Trust is highly important for the government and good governance (Kim 2010: 279), and to found trust, the government must govern better by being more transparent, responsible, accountable, and also more actively engaging with the public, particularly for their interest and be strictly respectful to the law (Kim 2010; Diamond 2007).

Good governance has been the most buzzing word since its inception, yet a relative concept because things that seem good for one country may be bad for another country's interest. Farazmand (2017) discussed how this clichéd concept had been forcibly bestowed to underdeveloped and least developing countries to adopt, and in the name of aids and grants how different partner organizations of the United Nations have penetrated subtle imperialist policies and imposed conditions in exchange of their loans. Good governance as a prescription promoted Structural Adjustment Program (SAP) that brought public sector reforms like trade liberalization, privatization of major economic sectors, reduction of subsidies in agriculture, shutting down of nationalized industries in these countries, and disrupted domestic economies. In response to such limitations, Farazmand (2004) suggested a comprehensive definition where he incorporated international financial and development

organizations along with good governance triad of the state, the civil society, and the private sector because of their ever-increasing interference in the less developed and developing countries' politics, economy, and the sovereignty. Farazmand's (2017) justification of sound governance is just right to depict the image of Bangladesh whose political economy is driven by global markets, multinational corporations, and local business elites.

## Conceptual Terms

**Trust**: Trust is considered as a psychological phenomenon between two parties where one party remains vulnerable to the actions of another party, the former finds trust if the latter is morally good, benevolent, honest, a promise keeper, predictable, and such other attributes for the former's beneficial outcome.

**Institutional Trust**: Institutional trust is founded on the premise of interpersonal trust basement. Institutional trust happens between the principal and agent, or service provider and service receiver, or the benefactor and the beneficiary, and such trust is simply the citizens' judgment of public services and the associated public personnel's qualities that allow them to consign trust to the particular institution. When the citizens/service receiver explores the civil servants' actions are compatible to their commitment, ethical in conduct, fairer in treatment, helpful in the necessity, discretionary in an emergency, transparent in decision making, a feeling of trust emerges in the public sector operation of the government while the absence of those actions accrues distrust correspondingly.

**Good Governance**: The concept of good governance simply implies that the affairs of the state are administered such that the state organizations manage public resources effectively; conform to designated function; involve citizens in decision making as a stakeholder; serve citizens efficiently surpassing factors like gender disparity, social status, and money holdings; show transparency in action; and be accountable to the citizens.

## Issues of Good Governance and Trust in Bangladesh

Bangladesh, the country of the rising economy, recently got the preliminary status as a developing country and yet to be under surveillance of the UN to achieve complete confirmation. Issues related to the governance of Bangladesh have never skipped, including in the agenda of international donors and development partners for the country's journey toward development and achievement of sustainable goals. Looking at history reveals that Bangladesh is a society bearing the culture of years of domination, exploitation, and colonial legacy. The country, since independence, has undergone different systems of government including the one-party system, coalition government, military rule, democratic presidential, or parliamentary form of government. The country augmented, endured, and sustained in the political arena of ups and downs for the visionary roles of charismatic leaders, prudent policies of party politicians, contribution in social and economic well-being achievement, coupled with the controversial acts and debauchery occurrences the regimes left. The political culture prevails in the country reflects that change of government calls forth declining previous projects despite containing good intention, above all; in the overall governing strategies of the state in the spheres of administration, political, economic, national, and international affairs through renovating, reforming, vanishing, or restoring ideas and habits, and unlikely is in a stable condition till date for numerous experimentation. So, good governance has always been a crying need for the people of this area toward progress and betterment.

In their book Khan and Islam (2015) mentioned the presence of three aspects in the governance of Bangladesh weakening the polity and inhibiting the potential to safeguard good governance practices: first, absence of institutionalized democracy for a less formal political culture where the members of a powerful nexus who capture power and authority of the state institutions (Alam and Teicher 2012) reside at the top strata of government. Second, intense corruption that is malignant like cancer, engulfed in all

sectors of the state whether it is economy, administration, or society by capturing the state resources to be concentrated in a few groups thus enhancing social inequality, depriving poor mass people to get services without kickbacks, and demoralizing values to act fairly. Hence the public governance pillars (administrative, political, economic, regulatory, and legislative) of Bangladesh posed formidable obstacles to key institutions of reform, refining processes, and strategies of management and guiding the country toward a more efficient and effective system (Alam and Teicher 2012: 2).

The administrative skeleton and the organs of public institutions of Bangladesh are a replication of the British Weberian administration. The public sector plays a dominant role in service provision where political authorities very often interfere in administrative decisions. Formalism happens when formal rules are relaxed to serve the specific interest but executed strictly with adversaries and system challengers (Farazmand 2004) and such practices are prevalent in the administration where public personnel serve patrons and show formalism in dealing with mass people. According to Farazmand (2017), institutions without sound organizations are fragile and fail to perform their purpose; with respect to Bangladesh, the institutional actors do not follow standard operating principles, and pursue their objectives in implementing policies, and the citizens also have limited scope to purchase services in a competitive market-like conditions (Zafarullah and Huque 2001). Furthermore, a low trustworthy society and fragile social capital never let people extend their trust to outsiders like public officials, and seek services through informal contracts, relationship building, and by practicing nepotism, favoritism, tadbir (persuasion), etc. Consequently, the status of Bangladesh is stained with the blame that public services are bought and sold in exchange for money, also through power, high possession, and influence in the society. In such a culture where unethical practices are rampant, cooperation from the administration is occasionally natural, and service transaction is costly (kickbacks, lobbying); the presence of good governance is at stake and distrust becomes high on the scale.

## Institutional Trust in Bangladesh: Determinants from Good Governance Stance

Good governance has shifted its focus from economic to noneconomic phenomena, particularly on the quality of government for citizens' support and trust in government (Rothstein and Torell 2008). The following points will elaborately discuss the state of good governance and corresponding trust situation in the context of Bangladesh, especially focusing on the public administration arena. International development partners and multinational financial institutions have provided indicators of good governance from different aspects. The recognized six indicators of good governance have been explained here to depict the circumstances of institutional trust in Bangladesh.

**Government Effectiveness**: The principle indicates to what extent the public and civil services rendered to the citizens have quality, whether they are consistent with policy commitment, fulfill public satisfaction as per their necessity, and above all, are free from political influences to execute independently. The quality of public service delivery in Bangladesh is featured as bounded to rules, time-consuming, noncooperative, and the actors mostly unhelpful and reactive. For the underlying issues, people instead of following formal procedures search for a lobby, personal connection, and political favor, and using these means receive services from actors and achieve satisfaction. Thus, gaining trust out of service satisfaction comes not following a prescribed way, but taking shelter in unsanctioned ways which is a paradoxical situation in public service governance in Bangladesh. Public service commitment to serving as a servant of the state bears mistrust as unethical practices cling to administrative services where public officials infringe service regulation, hamper the implementation of government policy at the grassroot levels, and consequently fail to meet policy goals and objectives.

**Participation**: It is the process of citizens' involvement in decision making through direct and indirect mechanisms as a stakeholder. Though

the articles of Bangladesh Constitution and Local Government directives allow local government to act as a representative platform, the culture of people's participation in administrative programs denies the real necessity of grassroot level people in Bangladesh. At the Union Parishad in rural local government, the members of the Wards feel less inclined to invite and inform citizens to provide opinions in Union Parishad budgeting, ward-based local planning, or in any development program of their area. Concerning participation, the elected representatives are uncommitted because they ensure engagement of their close associates, aged and renowned individuals of the area, and influential and affluent persons of the locality while the fate of the mass people lingers on the arbitrary decision of the few elite groups. Hence, with the introduction of electronic governance, the process of participation is expected to be easier for informed and educated citizens to have a quick view through government websites and send their opinions on important public issues of urban local government areas and ratings in different public utility programs, but the scenario of participation has not improved yet due to lack of arrangement in updating information in websites, delay in responses, and keeping citizens apart for being one of them.

**Rule of Law**: This principle implies the legal framework should be applied on an equal basis irrespective of social status, economic division, power, religion, gender, etc. As the implementation of this principle is destined for all public and private institutions to comply with, a significant role is played by the law enforcing and law adjudicating institution of government for its elevation and citizens' greater trustworthiness. The deprave practices of the Police department of Bangladesh comprise of harassing innocent people in charge of crime to forcibly collect money, releasing criminals, and also those who have a political backup and powerful possession in society. The increasing number of extrajudicial killing of law enforcement agents also trespasses the human rights of trial, or frequently the profound causes of serious cases nipped in the bud to be revealed. Furthermore, in Bangladesh, the judicial branch of government in operating its function impedes through unintended executive interference which is against the judiciary's independence and neutrality. Sometimes, cases either bearing political urgency or controversy are resolved fast, and others fused in case log accordingly. The existing state of rule of law and the associated institutions' realities in Bangladesh let citizens undermine their trust in the whole system.

**Accountability**: The term accountability refers to the actors of political and public institutions to justify their actions to the citizens. As a people's representative, the politicians of Bangladesh have apathy keeping in contact with citizens after the election, the power they exercise being in that position does not comply with fair procedure nevertheless, and there is a dearth in the culture of involving people to express their opinions and be answerable to them. In government organizations, citizen charter as an accountability tool has not been circulated yet; people are still unaware of what services are expected from an institution. The Comptroller and Auditor General reports of public accounts published are of preceding years, instead of the current year. The parliamentary sessions are the only way to keep the parliament members accountable where the opposition party's presence is rarely noticed for a constructive judgment of government. Despite the constitutional regulation the post of ombudsman has not institutionalized to check over statutory authorities' mismanagement and irregularities. Trust develops when the outcome of the trustee perceives to be trustworthy, and the existing practices of accountability appraisal could not bring out the answerability attitudes of the concerned actors so the citizens are distracted to be vigilant to check abuse of power.

**Transparency**: Transparency is an extended version of accountability that implies openness and dissemination of information for citizens' availability. A2I (Access to Information) and right to information measures in the public sector governance of Bangladesh have been innovated to fulfill citizens' necessity and to gain reliability. Though citizens are somewhat availing from such initiatives, many of the public personnel show rigidity and reluctant attitude to be frank in information providing showing excuses for secrecy. Besides, the state authorities claim the

tendering of government projects fully follows the e-GP (electronic Government Procurement) system that promotes transparency; however, the practicality shows the contractors get the projects through lobbying, or having connections with political incumbents. Hence, transparency becomes rhetoric and ineffective to induce mass people's trust in the functions of public institutions.

**Control of Corruption**: Geof Wood (cited in Askvik and Jamil 2013) has imaged Bangladesh as a "marketized state" where individuals buy and sell public services while people from the lower strata to the top layer of the society are submerged in corruption, committing petty corruption to grand ones and hindering that unethical practices is a priority for the country's development goals. Controlling corruption in sectors like economy, finance, administration, and politics should be the major agenda for greater utilization of national resources as well the assistance from development partners and also to ensure social justice. ACC (Anti-Corruption Commission) is the country's sole authority to investigate corruption cases of public organizations in Bangladesh, which is stigmatized with the controversy of taking ransom, deficit professionalism and courage to charge complaints against politically powerful persons, and declare arbitrary penalty and work in association with the ruling party (Iftekharuzzaman 2019). Consecutive governments have treated ACC as a part of the executive branch and curtailed its working freedom and power in different guises by taking steps like seeking prior approval from the government to arrest public officer – allegedly for corruption. The organization expects to put an end to corruption and restore public trust in government, but itself transformed as a troublesome entity. Therefore, the effectiveness of watchdog ACC not only achieves greater mass support and confidence but also promotes sound governance in the country.

## Conclusion

Trust is an essential element in any kind of social or organizational relationship over which the legitimacy of institutions is based on. The incapacity of representative and public service institutions to meet the civic responsibilities and perform mandates erodes the trust level of citizens. The players of the state institutions are the bearers by whom the practices of good governance are offered. So, when good governance exists, trust comes as a payoff. For Bangladesh the state of good governance can be termed as poor governance, where the citizens have profound distrust in the management and operation of the government agencies; and to weigh trust is hardy for citizens' subjective judgment of formal arrangements.

# Institutionalization and Its Many Facets

Stéphanie Gagnon
École nationale d'administration publique, Montréal, QC, Canada

## Synonyms

Diffusion; Process of stability; Reproductive process

## Definition

Institutionalization is a process. It involves the sequential steps required for a model to achieve an institutional status. Institutions simultaneously prescribe ways of acting and exist as a solution to collective problems.

## Introduction

The process of institutionalization has been documented in a variety of disciplines, namely, in political science, economics, and sociology. Although the focus of attention on the institution is not the same, these three disciplines recognize that institution plays a role in collective action and in response to basic needs. Also, institutions serve to regulate behavior, to guide them. It is a source of stability. That being said, institutions change regularly. Therefore, for new institutions to gain legitimacy, the process of institutionalization must be perpetually repeated.

In public administration, numerous models have been considered as institutions in the last 40 years, like New Public Management (NPM), collaborative governance, and sustainable development. These institutions have dramatically changed the management of the state and ministries. They gave rise to new laws and new practices. Because of the dual role of institutions (constraining by prescribing course of actions and helping to solve coordination problems), the process of institutionalization is particularly important to understand in public administration in order to be aware of the institutions that take precedence at a given moment and in a given context. Also, it is useful to understand how this process unfold. In other words, how do different models become institutionalized?

## Process of Institutionalization

The first writings on institutionalization proposed a two-step process. In fact, for Tolbert and Zucker (1983), the first step is the creation of an innovation (this stage has been labeled: preinstitutionalization) and the second step is the diffusion of the model. In their study on municipalities, they explain how a policy is institutionalized. They note a first mode of adoption of the policy, which is done quickly and is linked both to a regulation and the characteristics inherent to the Municipal organization adopting it. Then, they observe a second mode of

adoption, where dissemination takes place among similar organizations (diffusion). The more organizations adopt the procedure, the more institutionalized it becomes. Thus, adoption in this second stage is tied to a preoccupation for legitimacy.

This process was subsequently enriched by Greenwood et al. (2002), who propose a theorization step between the two stages already depicted in the process. The theorization helps explain the relevance of the model/innovation and to link it to prevailing ideas in a specific context (organization, society, etc.) in order to give it some legitimacy. For example, New Public Management is partially theorized on the search for efficiency and the rejection of bureaucracy.

Another stream of research (Czarniawska and Joerges 1996) used a model in three steps, depicting the complexity of the process of institutionalization and his political character. The first step is the transformation of the model that is chosen into objects (be it a politic, a label, etc.) in order to embody it in the organization. For Phillips et al. (2004), the object that is recognized as constitutive of institutions is texts. The second step is to put into practice the object(s) previously retained. In other words, it is a matter of applying the objects that represent the model in the daily activities of the actors. Finally, if the action taken in the second step is reproduced numerous times and acquires stability, the model becomes an institution.

There are two main differences between the two processes identified (process in two steps or three steps). The first one is linked to the fact that the second model includes agency. According to this process, models are proposed, applied, and reproduced by actors. Moreover, actors can use some models strategically over others. The second difference is related to the fact that in the first model, later adopters were doing it for legitimacy purpose. In contrast, in the second model, author proposes (Waldorff 2013) that discursive strategies are voluntary used to create legitimacy for a model or an object. Thus, the two-step model proposed that institutionalization and legitimacy were almost equivalent. The three-step model rather suggests that it is possible to influence the legitimization of a model.

## Elements that Can Become Institutions and Their Characteristics

The process of institutionalization has been studied at various levels. In fact, the literature discusses the institutionalization of models as much as of organizations or of fields. According to Berger and Luckmann (1966: 72), " institutionalization occurs whenever there is a reciprocal typification of habitualized actions by types of actors. Any such typification is an institution." Put simply, it means that institutionalization is achieved when people in a given group act the same way in the face of recurring activity. This way of acting is reproduced rather automatically. With time, it becomes the normal way of behaving. For example, civil service reform (Tolbert and Zucker 1983) and the community policing philosophy (Burruss and Giblin 2009) have been considered institutions at some point in time. These **models** have guided managers of public organizations in their decisions about the future of their organizations.

**Organizations** has also been characterized as institution. Selznick (1957: 139) underlines that: "the terms 'institution' and 'organization character' refer to the transformation of an engineered, technical arrangements of building blocks into a social organism." In other words, the organization is defined, over time, in relation to its contribution to society. For example, Selznick (1957) showed how the Tennessee Valley Authority (a public development agency in the Tennessee River Valley) had a distinctive character and was deeply rooted in community having incorporated an official into its structure to ensure sufficient local support.

This conception of organization is significant for public administration. First, it allows to consider the organization in its context, which is particularly important for public organizations since they are affected by their context whether it is the political environment, socio-economic

forces, etc. Second, the concept of legitimacy is intimately linked to the process of institutionalization. In fact, several studies have shown that organizations adopt a model for legitimacy purpose (Di Maggio and Powell 1991). The idea being that if an organization does not adopt a model that is widely endorsed by the majority of relevant stakeholders, they may ask why. Studies have illustrated that sometime the model may be mimic for reasons of legitimacy instead of efficiency. In fact, organizations gain legitimacy for acting like the others in the same sector even though the model they retain is not especially well suited for them. Other studies showed that the proponents of the model used several texts or discourses to promote (Waldorff 2013) and legitimize it. Public organizations are not immune to these two trends in the search for legitimacy.

A **field** can also be institutionalized or structured as Di Maggio and Powell (1983: 148) explain. For them, four steps are required in order to structure a field, namely:

1. The increase of the interactions between the organizations of the "future" field
2. The emergence of structures of domination in the form of a body that binds organizations together, and the emergence of coalition schemes
3. The increase of information to be processed for each organization
4. A mutual awareness of involvement in a common field of activity

## Sources of Institutionalization

Five sources are recognized in the process of institutionalization of a model, namely, the state (Di Maggio and Powell 1983), the professions (Di Maggio and Powell 1983), other organizations (Di Maggio and Powell 1983; Tolbert and Zucker 1983), individual actors (DiMaggio 1988), and cultural influence (Jepperson 1991).

The state mostly acts on institutionalization by the formulation of policy and through the rhetoric it favors. For example, in Quebec, the Public Administration Act stipulates that departments and agencies must prepare an annual management report. Professions, for their part, affect institutionalization by the models they privilege and the rules they establish. As far as organizations are concerned, they have an impact on the institutionalization of models, because they imitate each other. Also, some have the power to impose the rules of the game in their field. Some authors propose that individuals (sometime labeled institutional entrepreneur) or groups play a significant role in the institutionalization process thanks to their resources (Di Maggio 1988), the discourses they use (Waldorff 2013), etc. Finally, culture is also an element at the source of institutionalization (Jepperson 1991. Culture acts as an interpretative scheme and influences what will be considered compatible or not in the model to be implemented.

Thus, several types of actors, organizations, or culture can help to initiate or influence the process of institutionalization.

## Effects of Institutionalization

Effects of institutionalization are numerous. The first one is that institutionalization guides actions and sometimes proofs to be constraining. For example, if an organization chooses to implement the principles of NPM, it will need to act on it and demonstrate it. The second one is that isomorphism result from the process. In fact, this means that organizations are more and more similar because of the adoption of the same model. However, since two decades, a strand of literature rather proposes that variation ensue. According to the translation theory, even if similar models are applied in various organizations, they give rise to different practices (Pipan and Czarniawska 2010). The reason for this different proposition is that the interpretation of the model varies according to various organizational actors. Also, the model needs to be applied to the context in use, which also generate modifications to the original model. A third consequence of institutionalization is the recurrence of the institution or its propensity to

stay the same. In fact, for a long time, the literature only proposed institutionalization and its opposite, namely, deinstitutionalization to demonstrate the difficulty of the institution to change. Studies point out that the deinstitutionalization of a practice must take place before a new one can begin to become institutionalized (Zilber 2002). Recently, studies (Granqvist and Gustafsson 2016) acknowledge the fact that institutional development or change could be a possibility.

Finally, the increase of legitimacy is the most widespread consequence associated with the phenomenon of institutionalization. In fact, some authors (Lawrence et al. 2001) argue that legitimacy is a necessary step to attain institutionalization, whereas some consider that they are synonymous (Suchman 1995). This difference is explained by the process (two steps or three steps) favored to explain institutionalization.

## Conclusion

Even though there is not a consensus as to the process whereby a model become an institution, institutionalization matters. In society, institutions permeate life by promoting certain models over others and by prescribing ways of acting. The different ways of portraying the process vary in terms of steps, of actors implied, and on how much constraining institutions are. More recent studies recognize that it is possible to change the institution and that many actors are qualified to do so. However, the process is never fully controlled. Institutionalization will always have consequences that were not previously anticipated. The state and public administrations are part of this game of creating, reproducing and copying institutions.

# Institutionalizing Democracy

Toyin Cotties Adetiba
University of Zululand,
KwaDlangezwa, South Africa

## Synonyms

Consensual governance; Establishing classlessness; Formal equality; Social equality

## Definition

Institutionalizing democracy refers to the degree to which the electorates value the importance of their votes to validating good governance.

## Introduction

To be a legislator in [Nigeria] my state, all that is needed is a sum of [$833055.60] 300 million Naira; 100 million will go to my party's national chairperson, another 100 million will go to my constituency for mobilization, and the remaining 100 million will be divided into two with 60% going to my state's party chairperson and the remaining 40% will go to the "local boys" to solicit for their support. This is the submission of a friend planning to become a legislator in Nigeria's democratic system. By implication, corruption has surreptitiously become part of the state's constitution where democracy has been fully embraced.

In Africa, the questions about abuse of political power in democratic governance and corrupt practices have always attracted comments from scholars in the field of political science. Traditionally and politically, it is assumed that democracy greatly reduces corruption and increases citizenship participation in governance through their voting decisions and overall running of a country. Democracy is seen as system of governance that ensures inclusivity and encourages free will and unhindered public cooperation. Ideally, it is a system that is supposed to be characterized by accountability, transparency, and the provision and upholding of the tenets of the rule of law and the provision of human rights, hence continuing advocating for countries globally to enforce or perhaps embrace democracy as a system of governance. Although democracy seemingly seems to be the way to go in terms of political governance, every system has its advantages, and disadvantages and democracy are no different.

Often democracy has at times been blamed for harboring political dishonesty in the name of corruption and poor accountability compared to countries that are ruled by dictatorial or authoritarian leaders. Debatably, if democratic governance is properly consolidated, unquestionably, corruption can be considered to be on its way out of such democratic system. Measuring the true extent of corruption in a democratic country is very difficult if not impossible as corruption manifests itself in different socioeconomic and political forms; therefore to explicitly conclude a nation's true corruptibility is very difficult. Hence, the assertion that the institutional design of the political system is the ultimate determinant of corruption because of the same political system mirrors out the incentives facing government officials (Lederman et al. 2001).

Institutionalizing democracy and the concept of political corruption is a continuation of the discourse that seeks to connect the concept of political corruption to democratic standards. Precisely, the growth of scandals and the use of the word corruption in African public [political] office debatably are dated back to the period of political interregnum in 1960s and early 1990s, a period that sees the military at the helm of political affairs in most African States and a period when corruption was fully institutionalized on a very high scale level which may have very harmful and retrospective effects on economic and socio-political development.

In the changing circumstances of our times, corruption is considered a conservative assault on states constitution from the very powerful in

the society. It is beyond doubt that corruption and patronage are so omnipresent, rampant, and therefore crippling the society with many states on the verge of being deemed dysfunctional. This corroborates the idea of (Navot 2014, p. 5) that political corruption in democracies is corruption of democracies and that political corruption constitutes behaviours and practices that violate institutional democratic principles or which have the tendency to harm processes that build the democratic order. It relates to problems of trust, of lack of competition, and of systemic dependency on undue influence.

## Methodology

Questioning the applicability of vertical accountability in Nigeria's democracy, this work relied on mixed method of analysis. In social sciences mixed method affords researchers the opportunity to use several methods and measures of an experiential phenomenon in order to overcome the challenges of bias and validity while collecting data. Consequently, when dealing with a greasy and empirical phenomenon like democratic institution and corruption such as the case of Nigeria, a lack of specific idea can be wholly incommodious; hence, the mixed method is used. Mixed method is a combination of an integrative research methodology (it can be a combination of one-on-one interaction with people, observation, and in-depth thematic studies on corruption and democracy), in order to comprehend the central issues of concern in this work.

## Theoretical Framework

Theoretically, this work relies on the theory of culture of corruption as the tool of analysis. Why do some people choose corruption over honesty, while others do not? Is it only the economic costs and benefits associated with a corrupt act that are important, or do intrinsic motivations also play a determining role? And if intrinsic motivations are important, are they culturally determined? (Barr 2010, p. 862). These are probing questions that demand answers why trying to understand the level of corruption in Nigeria's democratic system. Barr and Serra further contend that inherent motivations originate from the internalization of social norms existing within a society. They argued that norms become social when the values that underpin the norms are shared within the society; consequently a deviation from the norm elicits social disapproval, and, if internalized, it generates feelings of shame and guilt. Therefore, according to (Licht et al. 2007) cultural values justify and guide the ways that sociopolitical and economic institutions function vis-à-vis their goals and their modus operandi. Actors in a political system draw on these to select their actions as well as evaluate people and events, to justify their actions.

Debatably, one may argue that it is possible to transmit values and beliefs from generation to generation to another through the immediate sociopolitical environment where a slow-moving component of [corruption] culture is represented. Barr and Serra (2010) argue that not only will the values and beliefs affect adherence to a particular social norm; nonetheless the section of people who adhere to the norm affects individuals' beliefs in the values that underpin the norm; as a result of this, the likelihood that the norm will be adopted by others including future generations is very high. It is therefore pertinent to say that the idea of a social norm that advocates abstinence from corruption can explain why a culture of corruption appears to persist in Nigerian polity.

## Explaining Democracy and Corruption in Nigeria

Defining democracy, to scholars of political science, does not take a very long time, and to find appropriate word in explaining details about democracy does not take time as well. This is because there is no specific manifest of democratic system all because scholars in their various analyses do repeat common principles and themes of democracy.

Democracy has also been described as a system of government where the political legitimacy

of the state through universal suffrage and regular elections, an effective political opposition and representative government, impartial and accessible criminal justice systems, and the absence of arbitrary government and human and civil rights indicated by freedom of religion, association, expression, and movement can be accessed without any form of political inhibition.

While expounding on democracy, (Nightingale 2015) submits that democracy can be explained differently from the traditional definitions while seeing it as a system that provides vertical, horizontal, and societal accountability. Traditionally, this model of accountability defines a vertical chain that provides a continuum of accountability relationships between the electorate, the parliament, the government, and by extension the public service.

Horizontal accountability means public servants are constitutionally accountable for their actions to institutions other than the parliament and can be obliged to explain their actions if found wanting. Societal accountability is a non-electoral mechanism that rests on the actions of a multiple array of citizens' associations, movements, the media, and actions aimed at exposing corrupt public office holders, thus bringing new issues onto the public agenda (Smulovitz and Peruzzotti 2000).

Explaining vertical accountability, Nightingale posits that autocratic governments all over the world depend on the support of a small assemblage of political and social elites (the military, the bureaucracy, and the secret police), and the general public have less influence on the political process and less knowledge about how sociopolitical and economic decisions are made, the result of which is less transparency and little or no accountability. Contrariwise, democratization of the political system somewhat allows the populace to hold their elected officials to account in that the populace have acquired more effective and extensive means of detecting corrupt practices. It therefore means that there should be dissatisfaction on the part of the electorate on performance of the incumbent government/party; the citizens can decide to vote for the opposition party.

Although the electorates may not be able to force the elected political office holders to embrace their political believe and actions, they can still use their political power (their numbers) to remove from office those political office holders who do not comply with their demands. The argument here is that the electorates have the motivation using the power of the ballot to restrain the greedy political office holders who use their position of power for personal gain and force them to work for the interests of their constituencies while inspiring them to transform their political behavior and be more conscious of who they are and what they are to the society.

As argued above there is possibility of the citizens to use their numerical advantage to dislodge corrupt political officials; it should however be noted that the corrupt political office holders have perfected and are still working on their plans to rid states (African States) of its resources. A former governor of Jigawa State (Northwest Nigeria) attested that in reality, the political elites are quite united in quietly sharing their looted money and delivering little or nothing to their various constituencies. They have a stake in keeping the country exactly as it is – weak and confused and easy to exploit. But how can the common men who have been kept squalid, wretched, and in sociopolitical and economic hell be made to fight corruption with their ballot papers in a situation where they are desperate to break the cord connecting them to poverty and hunger?

The above statement reinforces the submission of (Fjelde and Hegre 2007) that in Africa, leaders' ability to maintain elite cohesion and placate opposition rests on the illegitimate disbursement of regime patronage, a system called neo-patrimonialism. Several scholars have argued that higher electoral competition is associated with less political corruption and that the formal democratic institutions allow the citizenry to vote corrupt politicians out of office, provide incentives for the incumbent to align their policy with the preference of the citizenry, and thus abstain from illegitimate rent-seeking for political survival. Hence the question is whether vertical

accountability in democracy actually thrives in Nigerian polity or not.

As present as it seems to be in Nigerian polity, it has been difficult for the imposition of accountability through the electoral mechanism. Under normal circumstances, the incentives for political leaders to rely on illegitimate patronage should be at its lowest in democracies since a democratic incumbent's political base derives its power from the majority vote in elections; economies of scale would therefore lead incumbents to switch from a selective accommodation of private interest to policies that enhance the welfare of all citizens in society (Fjelde and Hegre 2007), but this is not the case in Nigeria where electoral checks are ineffective, thus endangering the stability of the democratic institution/regimes. Put in other words, the democratic institutions that ought to check corruption has paradoxically institutionalized corruption in the polity. By implication corruption has rendered democratic institutions/regimes less stable.

Sadly, corruption in Nigerian democratic system is not just the preserve of politicians and the high and mighty; rather it has partially become part of the country's constitution that is not written down. This pandemic is so deeply rooted in Nigeria's political system that it will require nothing short of a "major political surgery" to curb it. Debatably, corruption in Nigeria is responsible for the flight of thousands of youths to voluntary servitude in Europe, many of whom have drowned in the Mediterranean Sea. The phenomena is responsible for the mass poverty abysmal loss of tax payers' money that would have gone into service delivery, brain drain apart from deprivation of quality education, and good health services that people deserve.

In Nigeria no service is rendered without money exchanging hands. The system thus far has brought bestial underpinnings of the human nature, where there is a deliberate attempt by everyone to outdo the next person in corrupt practices. In Nigeria, corruption has taught people that it is dangerous to be honest. If you claimed to be good/honest as a public officer, there is possibility of becoming a public and endangered officer. The more daring and innovative you are in this vice [corruption], the more you earn public recognition through chieftaincy titles and honorary doctorate degrees, while many women queue up to join your harem. By implication it does not mean how good or innovative you are; if you are not part of them, you may not likely succeed. Hence the words of Achebe (Fatile 2012, p. 59) "anyone who can say that corruption in Nigeria has not yet become alarming is either a fool, a crook or else does not live in this country."

Over the years, the public sector in Nigeria has been characterized largely by ineffectiveness and inefficiency. What this portends to mean is that corruption is the source of many sociopolitical and economic problems that have militated against the attainment of economic development, equity, social justice, political integration, and stability, as well as sustainable democratic development in Nigeria. Scholars have come to agree that there are various types of corruption; these include political bureaucratic, private, public, materialistic and non-materialistic corruption, petty corruption, systemic, and non-systemic corruption. In the parlance of corruption is grand corruption otherwise known as state robbery where members of the political and bureaucratic class plunder the state treasury through brazen theft.

As alluded to by Elsa, vertical accountability in democracy helps the populace to acquire all-encompassing and effective means of detecting and punishing corrupt practices, but this seems not to be the case in Nigeria where the populace unknowingly have been caught in the web of corrupt practices via the institution of democracy; hence, the assertion is that corruption will always be prevalent in a democracy, mainly because politicians occupying high government and organizational positions as well as the electorates are human beings and are therefore susceptible to bribes and emotion.

Debatably, the most damaging effect of corruption is that it grows phenomenally if left on its own and spreads like cancer to vital centers of government with damaging influence on the public. Without much ado the negative multiplier effect of corruption in Nigeria has manifested in the mass spread of poverty, increased crime

rate, unemployment, decayed infrastructure, and inability to defend and protect its citizens within and outside the shores of the country against violent attacks as evidence in the nation's unfashionable position in the committee of poor and underdeveloped nations of the world.

What this suggests is that within the context of Nigeria, the problem of Nigeria is a crisis of governance orchestrated by corruption where state officials serves their own interests without fear of being called to account. Although corrupt practices are a global phenomenon, both Nigeria and Nigerians seem to suffer more from this malaise argued. Everyone in the polity believes that corruption is a norm in Nigeria. Notwithstanding the number of sociopolitical and economic reforms that have taken place in Nigeria, the lack of integrity and respect for the rights of others on the part of political leaders has left Nigeria a haven for corrupt leaders.

Judging from Table 1, debatably, there is no doubt that there is a dearth of good and accountable government in Nigeria if a total of N 214.5 billion of tax payers' money lies in the pocket of few individuals. What the above means is that there is likely going to be stagnation of socioeconomic and by extension political development owing to the continuous bureaucratic political and electoral corruption.

This is not, however, to draw a concluding remark that democracies are more corrupt compare to other forms of government, e.g., authoritarian government, in terms of institutionalizing corruption, but it is worth noting that because of the increase probability of power which has been decentralized, corruption may likely flourish as it is in Nigeria, unlike in a state where power is centralized to one or a handful of individuals. This statement is corroborated by (Seán 2012) that in a democracy corruption is a household name, because many people have the power to make decision, and in the absence of proper checks and balances to regulate and promote accountability, those individuals may likely if not ultimately engaged in committing corrupt activities.

In democratic countries, people through periodic elections have the power to remove leaders and elect new ones; hence fighting corruption becomes more effective through the power of the

**Institutionalizing Democracy, Table 1** Example of corrupt cases in Nigerian polity

Source: From Economic and Financial Crime Commission (EFCC) EFCC.org (Muhammed 2013, pp. 130–131)

ballot (Nurrochmat 2005); however, the socioeconomic inequality in democracies particularly Nigeria has increased the level of corruption, fostering the capture of key states institutions by a few politically connected individuals, who use these institutions to either fight their political enemies or solely for the process of enriching themselves in the process (Andrain and Smith 2006).

According to the US Institute of Peace, because of poor checks and balances in some democracies like Nigeria, corruption has become a crime syndicate on its own, where there have been clear-cut operational plans on how corrupt activities can be done; this usually involves politicians at the highest level. (Programme 2008) mentions that corruption in democracies involves the following: capturing of polices, abuse of office power, the illegal financing of political parties, rigging of elections, granting favors to certain individuals, and unethical influences of business operational practices. Democracy as a system of governance in its initial design was a great idea to bring people together and share ideas, allow people to have a say in governance matters, and to overall ensure that people are involved in governance in terms of the direction that a particular country is taking (Wheatley 2010).

It has however been argued that democracy has not always been a perfect system of governance; he however notes that it is the only system of governance that enables people to contribute effectively toward the directions the country is taking; hence a system is considered to be a great system of governance (Olsen 2017). Debatably and because of the lack of proper mechanisms aimed at measuring accountability and transparency, democracy can be easily manipulated to serve the interests of a few.

It has also been argued that while democracy as system of governance may lack the proper channels of accountability, developed nations such as the USA have been able to twerk democracy into a system that not only suits their needs but also ensures transparency and accountability; however, this in not say that such developed countries are corruption-free (Nolan et al. 2014).

Obviously, the problem with developing nations like Nigeria is that democracy only serves a few political leaders. Compare to other countries in Africa, many countries have resoundly adopted democratic systems; contrariwise, these countries have somewhat jettisoned democratic principles of accountability (Antwi-Boasiako and Okyere 2009). For example, there are many leaders who have been in office beyond their terms of office; to make matters worse, they have changed the constitution to ultimately extend their stay in office; these are all done against the backdrop of public opinions and disagreements. This goes to show that while democracy as a system of governance advocates for or perhaps envisions a situation where the voices of the people can be heard freely without any form of intimidation, the system itself can be easily manipulated (Gamage 2006).

That corruption exists in a democratic country is not because of a single cause, rather a combination of sociopolitical and economic forces orchestrated by politicians and businessmen and women in high offices owing to their knowledge and understanding of the loopholes that exist in a democratic system. To explain this further, in Nigerian polity, big businessmen during elections [donate millions of Naira] sponsored major political parties they believe could easily wins the election, and once such party wins the election, these businessmen through their political aides in government operate without any form of inhibition.

Corruption still survives as one of the greatest socioeconomic challenges that Nigeria faces. The existentiality of this phenomenon in virtually all aspects of the nation's socioeconomic life is understood to be one reason why poverty level remains very high in the country notwithstanding her position as the sixth highest producer of petroleum in the world, apart from other numerous human and natural resources, thus casting aspersion on the credibility of vertical accountability in Nigeria's democratic system.

## Conclusion

The paper examines the credibility of democracy vis-à-vis its vertical accountability in controlling corruption which has remain a challenge to

sustainable socioeconomic development in Nigerian polity.

A cursory observation into the Nigerian democratic system unpacked the perpetration of corruption in Nigeria with impunity with or without any stringent effort on the part of the government to bring the culprits to justice. Although, there are various anti-graft agencies such as Economic and Financial Crime Commission (EFCC) and Independent Corrupt Practices Commission (ICPC) established by the government, the democratic system vis-à-vis its practices in Nigeria seems to have escalated corrupt practices to its highest level.

The contention therefore is that unless the sociopolitical and economic elements that sustain corruption in Nigeria's democracy are curtailed, the power of the citizens through the ballot box will remain like the proverbial "toothless dog that can only bark but cannot bite" while trying to edge out corrupt leaders through the power of the ballot.

# Institutions and Wicked Problems

Gemma Carey, Fiona Buick and Eleanor Malbon
Centre for Public Service Research, University of New South Wales, Canberra, Australia

## Synonyms

Complex problems; Organizational practices; Organizational structures; Organizations

## Topics

Institutional structures; Informal practices; Wicked problems; Organizational cultures

## Definition

New institutionalism: Broad thrust of new institutionalism is the positioning of collective behaviour as patterned by informal institutional norms and values.
Wicked problems: Wicked problems are unstructured and fluid, have multiple and interconnected parts (i.e. are cross cutting) and can appear relentless – requiring novel approaches to problem solving and cross-governmental integration.
Isomorphic pressures: 'informal' institutionalised norms and values influence how organisations function, pushing organisations to a homogenous state.

## Introduction

This piece provides an overview of how theories of new institutionalism apply to government and the public sector and how they can be extended. While current research generally focuses on institutionalized practices as a source of inertia, attention must be given to the ways in which agents can enact change in the context of policy design and implementation. We argue that one way to reinsert agency back into institutional analysis of the public sector is to examine the interplay between formal institutional structures and/or rules and informal practices.

## Structural Change and Government

Early management research predominantly focused on the formal organization. It sought to 'scientifically' determine the best way to structure organisations (Fayol 1930) and conceptualize the 'ideal type' bureaucracy (Weber 1967). While our understanding of organisational performance has expanded to include 'informal' elements such as culture, norms, values and context (Powell and DiMaggio 1991) these early management beliefs still underpin practice in many settings. For example, formal organisational change and restructuring is still often used as a mechanism to achieve better organisational outcomes. This focus has been particularly apparent with the heightened interest in enhancing joined-up approaches in government from the 1990s onwards (Perri 1997).

## Joined-Up Government

Since the 1990s 'joined-up government', 'whole-of-government' and 'horizontal governance' approaches have emerged in many OECD countries as an attempt to grapple with 'wicked' public and social policy issues. Such issues are considered to span across boundaries, reflecting the nature of wicked problems. Wicked problems are unstructured and fluid, have multiple and interconnected parts (i.e. are cross cutting) and can appear relentless – requiring novel approaches to problem solving and cross-governmental integration. As a result, there have been a vast array of efforts across governments in various jurisdictions to create integration between service entities and program delivery at the local level and to create policy coherence within government. As Kelman (2007) has argued, "topics of collaboration across government agencies and between government, private and non-government organisations are the most discussed questions" in public management. Many additional pressures have led to the urge to join up, including the rise of new public governance and the power of ideas about how government should function, which can operate in both covert and explicit ways (Béland 2005; Farazmand 2012). It has been argued that since the renewed focus on joined-up government and governance[1] in the 1990s, joining-up has become synonymous with modernisation, future-proofing and proactive government (Hood 2005). 'Siloed' working is seen to be out-dated, while 'joined-up' and 'whole-of-government' working is considered the mark of governments who are ready to meet the challenges of the future (Carey 2016). In many

[1] There is a distinction between the terms joined-up *government*, which involves joining-up within the public sector, and joined-up *governance*, which involves inter-sectoral joining-up.

OECD countries, particularly those with Westminster systems, significant formal institutional re-structuring of departments has taken place in the name of breaking down silos and promoting whole-of government and/or joined-up practice (Perri 1997). Joined-up working can be created either horizontally or vertically across different policy actors inside and outside of government (Keast 2011). Horizontal integration tends to be a feature of 'bottom-up' approaches to joined-up government – the ideal end state for service delivery. Vertical integration, which is argued to be the most common, brings a range of activities under the purview of a single department. In his seminal work on vertical integration Chandler (Chandler 1993) argues that firms use vertical integration as a way to decrease costs and expand productivity through administrative coordination of a range of operating units. While Chandler argued that vertical integration was more profitable for firms, others have argued that any attempts to create joined-up working for solving wicked policy problems in the public sector should use both vertical and horizontal mechanisms.

The oversight of central agencies have come to be viewed as critical to vertical integration efforts (Keast 2011). This based on the belief that central agencies are "empowered to impose discipline upon line agencies to better align their work with government's priorities" (Keast 2011). More broadly, new public governance has seen the concentration of power in central agencies in Westminster systems. This role has emerged because of their position at the centre of decision making around key areas such as policy, finance, and administration (Carey et al. 2016). Typically this has involved central agencies using their authority to coerce organisations to align their activities with one another.

While restructuring bureaucracies has become a common practice in the quest for more effective processes and functioning to address wicked policy problems, this action is not based on solid evidence. At present, we have no evidence that formal restructuring of institutions enables or enhances joined-up working, or creates successful outcomes (Carey 2016). Despite this, structural reorganisation has taken on a mythological level of legitimacy that is not supported by either the experiences of those being restructured nor the international literature.

While much attention has been given to the formal structural of institutions, the interplay between these formal institutional structures and informal practices has received little attention. This is despite the fact that, as Kay and Daugbjerg (2015) note, we are seeing significant shifts in the balance of formality and informality in institutions which has created an uneasy relationship between institutional inheritance and 'purposeful design' in the governance change processes. In this piece we explore how formal institutional structures and informal practices can interact in unforeseen and problematic ways, and that these can be linked by ideas and ideation processes (i.e. the process of generating, developing, and communicating new ideas) (Béland 2005).

## New Institutionalism in the Public Sector

The theory of new institutionalism in organisational analysis has made substantive contributions to knowledge of how organisations operate and why – moving the focus away from rationalist explanations towards analyses which focus on the broader cultural and political contexts in which organisations are located (Powell and DiMaggio 1991). While there are a range of perspectives in new institutionalist theory, commonalities exist. These commonalities are: the positioning of collective behaviour as patterned by informal institutional norms; the view that institutions constitute critical contextual variables that determine behaviour and outcomes giving rise to a greater analytical focus on context; and greater attention is devoted to the constraints of rules and norms, as well as myths and symbols, that prescribe, pattern and legitimise social action (Powell and DiMaggio 1991; Béland 2005).

Far less attention has been given to how new institutionalism can inform the study of policy (Béland 2005; Frumkin and Galaskiewicz 2004). It has been argued that institutionalisation occurs through the regulation, accountability, oversight, accreditation

and funding functions of the public sector – creating 'professionalisation' and 'bureaucratisation' within other sectors (Considine and Lewis 2012). Yet, the public sector can be the object of institutionalised pressures itself rather than merely the source of institutionalised practices (Powell and DiMaggio 1991; Frumkin and Galaskiewicz 2004).

Powell and DiMaggio's formative approach to new institutionalism examines and describes the processes by which practices and organisations become institutionalised; characterised by routinised actions that give meaning to themselves and others (Powell and DiMaggio 1991). New institutionalists have provided considerable evidence that 'informal' institutionalised social practices (comprised of norms, values and other elements of 'culture') matter for how organisations function – they produce particular patterns of behaviour which diffuse across organisational boundaries through a process known as "isomorphic pressures" (Powell and DiMaggio 1991). This work argues that practices emerge from cultural expectations driven by inter- and intra-organisational factors.

## Isomorphism in the Public Sector

An important contribution for the study of the public sector from new institutionalist theories is an understanding of processes of isomorphism within the public sector. Isomorphism is a constraining process that results in organisations becoming homogenous in reaction to the external environment. Powell and DiMaggio (1991) argue that three primary, but overlapping, pressures exist which create and diffuse institutionalised practices: (1) coercive isomorphism that stems from political influence and the need for legitimacy, (2) mimetic isomorphism resulting from standard responses to uncertainty, and (3) normative isomorphism associated with professionalisation. The public sector is subjected to all three pressures, with coercive, mimetic and normative isomorphism impacting its institutionalized practices. However, Frumkin and Galaskiewicz have argued that public sector organisations may be more susceptible to normative and mimetic pressures because they have no single stakeholder group to monitor and evaluate their efforts in terms of the 'bottom line'. As a result, they may be swayed "by exposure to environmental pressures that promise . . . greater legitimacy" (Frumkin and Galaskiewicz 2004). These pressures can take the form of ideas (Béland 2005).

## The Role of Ideas in Shaping Formal Institutional Structures

Béland (2005) has argued that 'ideas' are an additional force acting on the public sector through politics and the demand for better policy; "ideational forces can become an independent variable that must be understood within specific institutional arrangements". Hence, these authors argue that 'ideas' are part of the construction of social, economic and environmental problems that governments must address; they form the basis of what direction institutional change takes (Béland 2005). While sometimes this takes the form of generating particular policies (in response to ideology), it can also exert pressure on government to undertake other types of reform, such as altering the formal structures of institutions, in an attempt to be better equip the organisation to tackle emerging problems. Here it is important to note that the authors have drawn a distinction between formal institutional structures (how institutions are organised in a formal sense) and informal 'institutionalised' practices (i.e. patterned behaviour) (Kay and Daugbjerg 2015). To study institutions, in both senses, Béland argues we must take account of the beliefs and assumptions of actors.

Like their private and not-for-profit counterparts, public sector organisations also need to be seen to be participating in institutionalised ways of working, and be structured in a legitimised institutional form. At the most basic level, this includes the creation of human resources departments or evaluation units that have become expected, or rationalised/institutionalised, organisational components. However, the construction of policy problems

can also exert pressures on government to undertake more radical reform. In recent years, ideas about wicked policy problems (combined with other institutional forces) have exerted pressure on governments to pursue integration. In turn, a wide range of different structural efforts have been undertaken by governments in an effort to create joined-up responses (Keast 2011), underpinned by assumptions regarding how public sector organisations should be constructed. The literature on new institutionalism in organisations has demonstrated that these 'institutional myths' (about how organisations or governments should be constructed) can produce significant inefficiencies and potential dysfunction. Here, 'institutionalised myths' refer to rationalised organisational myths which form part of institutional contexts in which organisations operate, and to which they adapt in order to maintain their social legitimacy. However, how institutional myths develop and exert isomorphic pressures across the public sector, and what this means for effective government, has been underexplored.

Taking a new institutionalist perspective on organisations locates irrationality in the formal structure of organisations themselves; formal institutional structures can drive inefficient and ineffective behaviour. In a similar vein, Giddens (1984) argues that the rationalised actions of individuals produce unintended consequences, both for immediate organisational contexts and broader social systems. Moreover, social actions become a further source of irrationality – potentially supporting and elaborating ineffective institutional myths (i.e. formal institutional structures). Hence, the literature on new institutionalism in organisations implies, but does not fully investigate, that these inefficiencies emerge because of the intersection between formal institutional structures and informal 'institutionalised' behaviours. Formal rules, which are divorced from organisational goals, lead to evermore elaborate social practices in an effort to support and compensate for ill-fitting structures (Powell and DiMaggio 1991). In response, informal institutionalised practices work to correct the limitations of formal institutions (Powell and DiMaggio 1991). However, Béland (2005) argues that new institutionalists have given considerable analytical attention to the ways in which informal institutional practices can also constrain behaviour, reinforcing path dependency, with too little attention to the ways in which agents can enact change in the context of policy design and implementation. Hence, one way to reinsert agency back into institutional analysis is to examine the interplay between formal institutional structures and/or rules and informal practices.

## Re-Conceptualising the Interplay of Formal and Informal Institutions

While well intentioned, the notion that structural change will automatically lead to enhanced joined-up working and the achievement of better outcomes, particularly for addressing wicked policy problems, is not substantiated by the literature. As Jun and Weare (2011) argue "public organizations must be perceived as politically legitimate, which requires that they conform to social expectations concerning organizational form and functions". Social actors, be it governments in power or individual public servants, must appeal to external institutionalised practices and pressures in order to maintain legitimacy. These operate primarily at the symbolic and ceremonial levels, creating the possibility that public sector organisations adopt structures and practices which are socially credible, but lead to decreased performance (Jun and Weare 2011). Critically, continual structural change can exacerbate tensions between formal institutional structures and informal institutional practices.

New institutionalists have argued that formal structures can often be the source of organisational dysfunction, and that this dysfunction becomes more elaborate over time where function has become decoupled from purpose or goals (Powell and DiMaggio 1991). Recent research suggests that adopting a structural solution to break down silos between departments and ensure quality in policy advice and implementation can achieve the opposite outcome(Carey et al. Forthcoming). Instead of enhancing integration and policy coherence, merging departments together

can exacerbate the tensions associated with cultural differences and associated silo mentalities. However, informal practices can also emerge to address structural deficiencies. Carey et al. (2016) found that, following structural change, informal boundary spanning practices emerged in response to limitations in formal institutional structures. These practices can ensure vertical integration between line agencies and central agencies, for example; enabling the type of integrated action presumed to be required for addressing wicked policy problems. These informal practices, however, can be disrupted, or even dismantled, by structural changes and can take years to re-develop (Andrews and Boyne 2012). For example, structural change can disrupt informal communication channels that are critical to organisational functioning but not codified in organisational structure (Carey et al. 2016). This is particularly evident when there is an over-emphasis on structural solutions and a devaluing of the crucial informal practices that keep an organisation together.

Hence, as Kay and Daugbjerg (2015) have hypothesised, changes to formal institutions can in fact upset or destroy informal institutional practices with severe, or at least adverse, consequences. While informal institutional practices can mediate formal structures, they take considerable time to develop. This is consistent with theories of social action and change, which indicate that changes to practice are incremental – requiring changes to actors' stocks of knowledge and routines (Giddens 1984). Similarly, in their study of structural change with the UK government Andrews and Boyne (2012) found that adaptation can take years, and that after formal institutional restructuring there is a significant period of disruption. Given the frequency of structural change within many bureaucracies there may be insufficient time for policymakers and administrators to develop practices which 'patch' gaps left by formal structural arrangements before the next round of restructuring begins. This, in turn, is likely to contribute to policy layering – where new practices and processes are layered on top of old ones (rather than replacing them), creating an increasingly complex context.

While Béland(2005) has argued for greater attention to ideation processes in the creation of policy and institutional change regarding ideology, ideas about how governments should be structured are also a powerful force on institutional change. Kay and Daugberj (2015) contend that the very structure of a department, or government, is an instrument of government in and of itself – either to deliver services or as a device by which to implement other 'instruments' aimed at shaping the behaviour of, or assisting, citizens. How governments are structured creates and constrains the future, shaping the practices of individuals. Hence, structural change to government is no small matter as it impacts current functioning and the availability of different options into the future for addressing wicked policy problems. For example, the informal practices disrupted by formal institutional changes may never change, leaving critical gaps in knowledge and practice which may have detrimental outcomes for the implementation of policy and/or other 'instruments'.

## Conclusion

This piece has sought to summarise and extend knowledge of how theories of new institutionalism apply to government and the public sector. While much of the literature focuses on institutionalized practices as a source of inertia, new work must reach beyond this simple finding to explore how formal and informal institutions collide to produce particular outcomes. To date, too little attention has been given to the ways in which agents can enact change in the context of policy design and implementation. We have argued that an important way to reinsert agency back into institutional analysis of the public sector is to examine the interplay between formal institutional structures and/or rules and informal practices. Informal institutional practices can also circumvent problems with formal structures – making them highly productive for achieving policy goals. However, without devoting sufficient consideration to the interplay between them, formal and informal institutions can disrupt one another to create dysfunction.

# Instrumentally Rationalizing Public Administration

Md Nazirul Islam Sarker
School of Public Administration,
Sichuan University, Chengdu, China

## Synonyms

Instrumentally rational; Pragmatism; Public administration; Public values; Rationalism; Sustainable development; Value realization

## Definition

"Rational" is a term which has different meanings in different contexts. Generally, it means real, pragmatic, knowledge, and human action. Instrumental rationality in public administration means the rational ways to attain the organizational goals of public administration.

## Introduction

The term rational means how we act and behave but not making judgment. It also means act to achieve our best purposes. So, it is the ways to achieve goals rather than means. The first case is the dealing with an instrumental rationality and then with value rationality in an organization in the weberian tradition (Leoveanu 2013). Instrumental rationality means the rational ways to achieve the goals of public organization. Public administration is broadly technical and applied field of study and practice which is covering external and internal aspects of administration. The process of budgeting, managing personnel, and other internal aspects of administration are considered as instrumental view of public administration. The instrumental view helps to find out public purposes and how public administrators interact with people and effected officials for shaping governmental plan and action (Lubienski 2003). It also assumes that public

employees are waiting at their office desk for order regarding what is to be done, when it is to be done, how it is to be done. The public officials are waiting for order from top level administrators who are knowledgeable in the specific fields of governmental policies and programs. It also helps for interaction among public officials, elected representative, and peoples for formulating pragmatic goals and plans for action, putting them into action and provisioning for revision of the program if necessary in implementation (Mann 1999).

The organization should use their resources in such a way that a better output may come by utilizing minimum resources. The organizational goal should be comprehensive so that every public official gets a clear idea about the strategy for achieving the goals. There should be alternative for attaining the goals and objectives.

Moynihan (2003) argues that the instrumental perspective suggests that public administrators are more likely to be related with the weave located on the decision-making process arising from public participation. Governmental decision-making may be hampered by increased people participation and limited opportunities and a restricted time period (Craske and Loschmann 2018).

Administrators may assume that participation reduces the quality of the decision making. Poor decisions may be emerged which offering criteria and values that may conflict with bureaucratic or expert defined rational criteria for decision outputs due to a lack of knowledge or expertise of the public (Cleveland 1987). Moynihan (2003) argues that the instrumental perspective is not, however, exclusively limited to costs. An assumption should be maintained regarding administrators who may be to some extent rational and care about policies and activities, participation benefits of the organization may be considered as instrumental rather than the normative values.

Bouwmeester (2013) suggested that improving public efficiency requires allocative efficiency of maximum resource allocation or managerial proficiency which may lead to improve the provision of public service. Sometimes a best and innovative solution may come from public input that would be a great participatory decision-making for instrumental public administration. But it is very rare in developing countries. Though parliament member is elected by the democratic process, they raise a little reflection of ordinary people in participatory decision-making.

## Status of Instrumental Rationalism of Public Administration in Developing Countries

Public Administrations in developing countries are characterized by the following issues of instrumental rationalism.

### Planning of Policies and Program

Planning is the essential items for policies and program designed by government. In developing countries, planning is well but problem in implementation. Some organizations are doing well due to devotion of its employees and administrator but most of the projects are failed to achieve the goals due to corruption.

### Centralization and Decentralization

There is a debate regarding centralization and decentralization. Some thinkers argue that centralization of power is best for development in developing countries but some other argues that decentralization of power is best for development especially in developing countries. The donor organization like World Bank and IMF emphasizes that decentralization of power is well for development. But from the practical experience, it is found that developing countries started their decentralization theoretically by establishing

local government but still local government has no mentionable power to do their development. For example, in Bangladesh, the major activities of local administrations are issuing citizenship certificate, birth certificate, death certificate, and construction of road, bridge, and culvert with delivering some government allowances to poor people.

## Lateral and Horizontal Allocation of Responsibilities

For achieving organizational goals, it is necessary to allocate the responsibilities among different level officials and administrator so that they can concentrate their duties and engage their efforts. In developing countries, it is not well mannered; there is a common culture of red-tapism. The job allocation should be allocated in laterally and horizontally.

## Lack of Coordination

The lack of coordination is hampering the output of an organization. In developing countries, there are so many organizations doing their job individually at the field level for betterment of the poor people, though some other organizations doing the same work at the same time. As a result, the output is not up to mark. There is a lack of coordination at top level of administration that is ministry level among different ministries, for example, in Bangladesh. It is also available in various organizations.

## Decision-Making and Program Management

The decision making procedure is autocratic in nature in developing countries. The leadership is authoritarian, so they take decision by themselves without participation of other. It is available at top level to bottom level of administration. Participatory decision-making process is necessary at all levels of administration. Public administrator especially recruited administrator faces political interruption in managing their day to day affairs. It is almost common in developing countries.

## Influence Upon Political and Administrative Decision-Making

There is a common problem between recruited administrator and elected administrator in decision-making process. One group presents a solution but other group opposes it. Generally ruling party try to control all spheres of decision-making process in developing countries. As a result, the experienced recruited administrators sometimes feel bothering due to negligence from elected administrator. So, the distance between recruited administrator and elected administrator should be minimized for smooth development of the country.

## Public Interest Group

There are public interest groups available in developing countries who criticize the bad decision of government, as a result, government can take right decision. So, public interest groups have a vital role for development of the country.

## Specialization and Expertise of Administration

A specialized and expert administration is required for smooth and sustainable development of a country. There are specialized and expert administrators available in the developing countries but due to corruption and political interruption, they cannot engage their expertise in the respected field.

## Authority of Position

The leadership in developing countries is almost authoritarian. Though so-called democracy is available, it cannot establish democratic leader. So, the position of administrator is a vital factor in instrumental public administration. The hierarchical position should be such that the subordinate can present their opinion in decision-making and do their responsibilities smoothly for achieving the goals of organization.

## Organizational Loyalty

Organizational loyalty is very necessary for running organization smoothly. Every administrator should be loyal to their duties and responsibilities. In developing countries, organizational loyalty is available but not all organizations. The administrator is corrupted and violated the loyalty. If administrator can stop the culture of bribery, it will be loyal, and it is necessary for overall development of the country.

## Political Neutrality

Political neutrality is very rare in developing countries. Political parties want to do everything according to their wills. But it is an instrument to develop a country. A neutrality culture should be adopted by political party so that ordinary people can get opportunity equally.

## Issues of Instrumentally Rationalizing Public Administration in Developed Countries

It is assumed that developed countries already reached at a certain level of socioeconomic development and democratic consciousness. Western Europe, North America, and some other far eastern countries like China, Japan, and South Korea are considered as the developed countries.

Milward (2016) reported that instruments of governance such as contracts, partnerships, and agreements are often considered as the pathways of slow-footed bureaucracies which are not interested to accept modern business approaches. Public organizations are also transformed to rational value-based instruments for delivering better public services, faster and easily to citizens cheaply. It is generally seen that nongovernment organizations cannot do better without the help of government organization. It is better to involve the private organization for helping governments for ensuring better public services delivery to citizens.

One of the key concerns is that the privatization of public services can be, if not properly, designed; it may be difficult for governments to control them. The major decision-making and its related policy matters are in the hands of many public administrators inside and outside of organization when the instruments of governance involve services delivery systems. The constancy, centralization, and resources contracts do not take place without a big deal of consideration on the part of a government (Whetsell and Shields 2015).

The approach of police of the developed countries is totally different from the developing countries due to different structure. The authority of power, duties, responsibilities, rules, regulations, and budget structure is different between developed and developing countries. That is why, the output is different. There are some contradicting points, namely, such as remote work style of the British police from the people, strict hierarchical authority, broad discretion in the lower ranks, and the main line of action being sudden and reactive responses rather than predesigned strategic ones.

Kettl (2006) reported the following points as instruments for achieving organizational goals in American public administration institution.

**Mission**: Every organization should have a mission which defines purpose, meaning, and ways of organizational goals. It also defines what is not appropriate for organization. An organization and its mission are always within a political system which implement

government's commitment and address related problems.

**Resources**: The resources should be used properly to obtain organizational goals. The allocation of resources is necessary for providing an important way of the government for translating symbols into reality. There should be a specific boundary to differentiate government from rest of the society so that government and private resources would be used properly for betterment of public.

**Capacity**: For building capacity, the capacity to carry out its mission, resources are necessary. Organizational structure also acts a capacity of the organization.

**Responsibility**: Each individual's responsibility is necessary for achieving organizational goals. There is a requirement to coordinate the activities of the members of organizations so that individuals avoid doing the same thing.

**Accountability**: All the politically elected administrator and recruited administrator should be accountable so that an organization can achieve its goals.

## Conclusion

This chapter highlights the present situation of instrumentally rationalizing public administration in developed and developing countries with barriers and criticisms. The ways of achieving the organizational goal of public administration in developed and developing countries are also focused. Proper planning of policies and programs, decentralization, proper coordination, corruption free organization, accountability and transparency, and lateral and horizontal allocation of responsibilities are the main ways and instruments for effective public administration in developing countries. On the other hand, maximum utilization of resources, capacity building, personnel responsibility, and accountability are the main ways and instruments for effective public administration in developed countries. Most of the developing countries are struggling to find out remedies regarding an effective and rational instrumental public administration, but due to corruption, authoritative bureaucracy, it could not be possible to get a effective public administration. So, public organization should be adapted to instrumentally rational values for effective public administration.

# Integrated Management Systems

Marcia Nathai-Balkissoon
Department of Management Studies, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Combined management systems; Shared management systems

## Definition

A single management system that a company establishes to satisfy multiple management system standards at the same time.

## Introduction

Management systems have existed for as long as companies have existed, since involved approaches (no matter how informal) would have been needed to manage those entities. While systems (which are comprised of a series of processes) may be established informally to deal with day-to-day management demands, there are various reasons for companies to formalize such systems. As companies grow larger or more complex, it becomes harder to maintain consistency in the operation of informal management systems, causing output quality and other factors to begin fluctuating. Formalizing management systems helps companies to crystallize their values and aims, develop documented procedures that promote consistent work approaches, use data to evaluate their effectiveness and efficiency, and improve their operations.

Management system standards support the development of company management systems. For example, in 1987, the launch of the ISO 9000 series of quality management system (QMS) standards marked a worldwide shift toward formalization of management systems within companies all around the world. Over the years, many companies engaged in developing and maintaining separate management systems in areas beyond quality management. These often included stand-alone environmental management systems (EMS), occupational safety and health management systems (OSHMS), and food safety management systems (FSMS).

At that time, management system standards were developed with minimal reference to one another, and there was little focus on trying to meet the requirements or structures across systems. Nevertheless, given that every management system was intended to help companies manage their affairs in a particular field of practice, it became obvious that every stand-alone management system shared certain similarities with others within a company. For example, within a QMS and an EMS, there were several overlapping areas between flow charts and standard operating procedures that were written to capture the way processes worked in a company. Standards organizations began to respond by making documentation, maintenance, and certification to their standards less onerous by allowing some processes to be shared across systems. For example, the ISO responded by developing its QMS standard (ISO 9001:2008) to align with its existing EMS standard (ISO 14001:2005).

The trend toward increased efficiency has ramped up considerably during the last two decades. In the light of the global downturn that began in the 2000s, companies embraced system integration as one way to conserve critical resources. They recognized that the benefits of integrating their management systems included lower operating and maintenance costs, brought about by increased efficiency and effectiveness. Certification bodies, too, supported integration efforts, offering reduced costs for auditing integrated systems, as opposed to stand-alone systems requiring more involved audits of lengthier durations.

## What Is an Integrated Management System?

In any management system, there exists a multi-tier structure, as shown in Fig. 1. At the very top, governing all that happens in the system is the overarching policy document that sets the context for the system. At this first level, company values, vision, mission, objectives/targets, and organization structure are typically set out along with the system policy statement. At the second level, the central processes of the company are delineated using (as a minimum) the standard operating procedures (SOPs) required in the chosen standard. Process flow charts might also be used in level 1 and/or 2.

Sometimes it is not enough to document *what* steps to take, and it becomes necessary to detail precisely *how* to go about fulfilling an SOP's steps. This is achieved by developing the third level of the system, the work instructions (WIs). The fourth level is the final one, where records are maintained to mark the operation of processes. Data collection may be automated or manual, and records may be electronic or otherwise. In contrast to the standards of the twentieth century, the standards of today are less stringent about mandating that all processes and procedures should be documented, with data maintained to prove correct operation throughout the system. Instead, documentation of many system elements is being left to the discretion of the company, and only a few core processes (such as objective setting, performance measurement, and continual improvement) might be mandated by any one standard.

**Integrated Management Systems, Fig. 1** The multi-tier structure of a management system

When a company has multiple stand-alone management systems, each system has its own unconnected multi-tier components. Figure 2 illustrates the situation if there are three stand-alone management systems, namely, a QMS, OSHMS, and EMS. In this situation, each system may include some processes that are similar to processes in one or more of the other management systems. Since systems would not share a common process, process duplication occurs in each stand-alone system. For example, auditing may be practiced in similar ways in all three systems, requiring a QMS internal audit system, an OSHMS internal audit system, and an EMS internal audit system. This arrangement is very resource inefficient, requiring three audit processes to be maintained by three separate process owners and supported by separate audit teams that follow separate audit schedules. These three audit schedules are then applied within the operations of a single organization, putting pressure on the operations systems and staff to accommodate their demands. Since these three audit processes would have similar purposes and approaches, it would be beneficial (and likely fairly simple) to combine them into a single process that serves all three systems.

When processes common to multiple individual management systems are combined within one overarching management system, this is referred to as process integration. The resulting combined management system, containing shared oversight, process management, and system improvement elements, is referred to as an integrated management system (IMS). The ISO (2016) explains that an integrated management system is a "single. . . . . .management system that can meet the requirements of two or more management system standards simultaneously."

**Integrated Management Systems, Fig. 2** Three stand-alone management systems

Systems are shared when any component process is controlled by a single person within the organization and when a cross-functional approach to operation of the element is used. Within an IMS, the majority of elements and processes would be shared, but the company may choose to leave some elements unintegrated. For example, if different approaches to risk assessment are applied within a QMS and OSHMS, the company might decide to allow aspects of its risk management processes to stand apart and be implemented, maintained, and audited separately from one another.

## A Brief Look at Some Popular Management System Standards

### ISO 9001:2015 Quality Management Systems

Quality management systems are intended to support a company in the provision of outputs that meet regulatory requirements and their customers' needs, most notably by providing quality goods and services and continually improving. As a result of satisfying customers, these systems are logically expected to also grow customer loyalty and company profitability.

ISO 9001 is the most used quality management standard worldwide. The most recent version, ISO 9001:2015, includes seven core principles, namely, (1) customer focus, (2) leadership, (3) engagement of people, (4) process approach, (5) improvement, (6) evidence-based decision-making, and (7) relationship management. These principles would ideally influence organizations' values and support the conduct of their everyday work. The standard follows a plan-do-check-act (PDCA) approach that encourages organizations to continually improve. The main elements within the standard's structure are mapped against the PDCA cycle in Fig. 3.

Where OSHMS, FSMS, and EMS standards have been inherently risk-based, requiring risk assessments and mitigation actions as a part of system maintenance and certification, risk has not been a major feature in past versions of the ISO 9001 standard. The ISO 9001:2015 standard is overtly focusing on risk management for the first time, and so integration on this front may also become more straightforward.

### ISO 14001:2015 Environmental Management Systems

Environmental management systems support companies' responsible care of the environment. Environmental management systems are useful to help companies assess their environmental risk positions, and then manage their environmental performance, bearing in mind the needs of "interested parties" including stakeholders. ISO 14001 is the most popular EMS standard used internationally. In fact, ISO surveys (ISO 2015) have shown that certification to the standard increased by 8% in both 2014 and 2015. This reflects that more companies may be focused on corporate social responsibility issues, including caring

**Integrated Management Systems, Fig. 3** The PDCA cycle is an enabling model for many management system standards

about the environmental impact of their operations, products, and services.

In line with the PDCA cycle, the company seeks to understand its processes and those of its partners. The companies collaborate to scrutinize the environmental impact of their processes and to develop a plan for continual improvement of their environmental impact. This improvement-focused approach would usually include elements such as setting environmental performance targets, resource and communication management, strong operations management (from process establishment to emergency management), performance measurement and reporting, nonconformance management, conduct of audits, and management review.

## OHSAS 18001 Occupational Safety and Health Management Systems

Occupational safety and health management systems help companies to structure their approach to work with stakeholder safety, health, and well-being in mind. Stakeholders include employees, others on the compound such as contractors and visitors, and those outside of the company's premises such as the public, who could be affected by the work of the company. A more detailed treatment of considerations in OSH management systems is available in the chapter titled "Occupational Safety and Health in Organizational Strategy."

The most popular international OSHMS standard currently in use is the OHSAS 18001 standard. It, too, operates in alignment with the PDCA cycle. This has facilitated integration of many of its management system elements with ISO 9001 system elements. Full alignment of the standards will be possible by 2017, when the ISO 45001 standard is expected to replace OHSAS 18001. In accordance with the PDCA cycle shown in Fig. 3, the section on planning would focus heavily on objective setting, action planning, hazard identification, and risk management. Second, planning would flow directly into implementation, including implementation of carefully rationalized process control measures, control of contractors, and emergency response. Third, monitoring and measurement practices would constitute most of the work to be done in evaluating OSHMS performance. Fourth, improvement would be driven by accident reporting and investigation, audit, management review, and any other efforts that bring about corrective action or cause changes that improve system effectiveness.

## ISO 22000 Food Safety Management Systems

The ISO 22000 family of standards was created to promote food safety for all food production and food processing operations from farm to table. This is increasingly critical since global trade makes food available in disparate locations across

the globe. Issues with food selection, cultivation, harvesting, formulation, preparation, processing, handling, storage, or contamination could convey the risk of illness, disease, or death to consumers. Therefore, risk management is critical for food safety.

The ISO 22000 standard has incorporated food safety prerequisites (also called good manufacturing practices) as well as Hazard Analysis Critical Control Point (HACCP) principles. HACCP principles include identifying modes of food contamination and determination of critical control points for mitigation actions to control biological, physical, or chemical hazards (see Nathai-Balkissoon and Arumugadasan 2005).

Many companies seeking FSMS certification seek the FSSC food safety system certification. It recognizes that (1) technical food safety practices are in place as stipulated by the Global Food Safety Initiative (GFSI); and (2) management system elements and prerequisite elements have been met as outlined in ISO 22000.

### Use of a Common High-Level Structure Across All ISO Management System Standards

Management system integration has been facilitated by standards organizations who have adopted a high-level structure (HLS) that aligns the structure of several standards. For example, an HLS has been applied to the ISO 45001 (draft), ISO 9001, and ISO 14001 standards, so that a single integrated system can be readily shaped to manage quality, environmental, and occupational safety and health in an organization.

The ISO directives include "Annex SL," which specified that all management system standards generated by the ISO must follow the structure: (1) scope, (2) normative references, (3) terms and definitions, (4) context of the organization, (5) leadership, (6) planning, (7) support, (8) operation, (9) performance evaluation, and (10) improvement. Further, where there are common terms, concepts, or requirements applicable to multiple standards, the same wording is used in all standards to avoid confusion or differences in interpretation and implementation. Since 2012, the use of this standardized structure when writing or revising management system standards facilitated harmonization when developing systems. Sections (4) through (10) of the structure map directly into the PDCA approach and the structure of the management system, as was shown in Fig. 3.

## Some Important Management System Elements

### Policy/Direction/Organization

The Policy Manual, as mentioned before, provides an overview of the organization's focus. Therefore, it addresses the scope of the management system and sets out the organization's policy and high-level goals and objectives, with which its operations must then align (see subsection titled "Performance Management" for more in this area). Functional responsibilities are also defined, often through the presentation of an organizational hierarchy chart. This gives some insight into leadership and process performance roles in the company, though a range of other content, such as job descriptions, could supplement it. Furthermore, the policy manual proclaims the focus and priorities to all stakeholders, heralding top management commitment and encouraging employee buy-in and active support.

Customer focus is emerging as one of the most critical elements for business effectiveness and success. Customers are often embedded into the management system in a myriad of ways, from stakeholders named in a policy document to subjects of business objectives, to process enablers in lower levels of the management system. Table 1 identifies some of the internal and external customers resident in different management systems.

**Performance Management** Performance management aims to bring about a shift in organizations' modus operandi by focusing management and staff on achieving agreed goals, allocating resources as needed, and aligning and adjusting systems, practices, and behaviors in pursuit of those goals (Amaratunga and Baldry 2002). Performance measures may either be lagging (reactive) or leading (proactive). Lagging indicators get their name because they capture

**Integrated Management Systems, Table 1** Examples of customers in management systems

| System | Customers |
|---|---|
| QMS | Company fabricator using specifications from a company design engineer<br>Hotel guest<br>User of a company product<br>Student in a university course |
| EMS | Community member affected by a corporate social responsibility project<br>Company partnering with a supplier to reduce pollution<br>Household user reading instructions on proper disposal of cleaning agent<br>Town undergoing an environmental impact assessment |
| OSHMS | Farmer using a rented tractor to clear his field<br>Operator using safety boots from a supplier<br>Company doctor screening health of job applicants<br>Company using government guidelines to establish safety procedures |
| FSMS | Diner on airplane<br>Supermarket customer buying food<br>Warehouse manager receiving harvested root vegetables from a farmer<br>Cooking operator using raw materials from warehouse |

performance or output after a function is complete, i.e., they follow or lag the completion of the function. As an example, sales revenue figures shared by a financial comptroller are the company's report of data captured *after* sales have been completed. In contrast, leading indicators are more predictive in nature, so in this example they would focus instead on measuring aspects that could positively influence sales. While they may not be as easy or convenient to measure as completed sales, they could be used to positively influence sales levels. An example of leading indicators could be the number of new products launched and the customer satisfaction rate, both of which could foreshadow sales revenue in coming months.

While lagging indicators are more popularly used, there are clear benefits to including leading indicators within company performance management systems. Table 2 lists some leading and lagging indicators that could be used within integrated management systems.

**Integrated Management Systems, Table 2** Examples of leading and lagging indicators in management systems

| IMS area | Lagging indicator | Leading indicator |
|---|---|---|
| QMS | Number of customer complaints<br>On-time delivery | Customer satisfaction indices<br>Corrective action completion rate |
| EMS | Pipe rupture rates<br>Weight of pollutants discharged | Pipe ultrasound screening and repair rates<br>Number of community outreach activities |
| OSHMS | Number of accidents<br>Number of hours lost | % of employees trained<br>Number of processes audited |
| FSMS | Microbial load in sample<br>Dilution of sanitizing agent | % of workers with acceptable swab results<br>Number of frozen replaced by fresh ingredients |

## Central Processes

A number of processes sit at the core of the operations of a management system. Some of the major processes include documentation and document control, training, nonconformance management, corporate responsibility and sustainability, and risk management.

**System Documentation and Document Control** In the 1980s and 1990s, management system standards often mandated documentation of procedures for every process undertaken by an organization. However, this approach was too onerous to be practical, and (outside of just a few mandatory processes) standards have been shifting to allow companies to decide which processes are most critical, which procedures they wish to document, and which types of documentation they wish to use. Thus, process documentation may take the form of SOPs, WIs, process flow charts, schematics, and so on. Still critical, however, is that companies demonstrate how their processes support realization of their targets, including satisfaction of stakeholders, especially customers.

Controlling documents and data is also very important to maintain the validity of data and information and to protect those whose data is

being collected as well as those using the data. So important is this document and data control that procedures are often written to focus on how version control and data security are managed.

**Training** Like documentation, training shares information with employees and other stakeholders. However, training goes further in that, depending on its approach, training can be used to build trainee competence by providing theoretical grounding and enhancing practical experience. Where documentation shares information passively, the active nature of training allows for interactive learning, and this back-and-forth communication supports more robust learning. Training is a ready candidate for inclusion in an IMS, as competence should lie at the heart of every management system.

**Nonconformance Management** As operations proceed, mistakes happen and unforeseen challenges arise. Sometimes failures result that could compromise the company end product, cause customer dissatisfaction, or pose a threat to safety or the environment. Many failures flag issues that should not be allowed to recur, and so a nonconformance management process becomes important. Nonconformances should be evaluated to identify their root causes and to implement corrective action so that recurrence is preempted. While the addressing of nonconformances does not normally fit within the "act" phase of the PDCA cycle, corrective action makes a valuable contribution to continual improvement of an organization.

**Corporate Responsibility and Sustainability** There is a steady trend toward inclusion of social responsibility and sustainability elements in modern company strategies. To this end, no matter which management system is being developed, companies are likely to incorporate elements such as community partnering, environmental stewardship, and conservation. The benefits to the company are manifold and include stronger linkages with communities, enhanced brand image and brand loyalty, improved resource utilization (e.g., through recycling efforts), lowered operating costs, and increased profitability.

A comprehensive corporate responsibility/sustainability program is achievable when management systems are integrated. The program's benefits would accrue to all component systems, and resources that might once have been divided among multiple stand-alone systems could be combined to greater effect and benefit, both for the community and the company.

**Risk Management** Organizations operate in a world fraught with conflict and unforeseen issues. Therefore, they must be able to evaluate and manage risk in order to succeed. Management systems must take risk management into account, and a majority of management system standards highlight this as a requirement for certification. Traditional approaches to risk management may differ from one type of management system to the other, but the ultimate aim of risk management is to identify where risk exists and how such risk can derail the organization's efforts to meet its objectives. This is a concern in every stand-alone management system, and it is therefore a prime process to integrate. The IMS should outline the process for risk management, starting with what could go wrong and how, how likely and severe the risk is estimated to be, the ultimate effect expected on company performance, and what action plans are to be implemented to mitigate or eliminate the risk.

## Improvement

In the course of company operations, undertakings such as business process reengineering or research and development could put forward bold new ideas or approaches that move an organization forward by leaps and bounds. Such radical improvements would be wonderful, though rare. In a management system, it is much more likely that a myriad of incremental improvements would be effected. A range of improvement approaches and review modalities find application here.

Audits are formal on-site verifications focused on checking whether the whole system or its component processes are conforming to standards established for the company. These standards could be established within a management system standard, statutory requirements, procedures set out by the company, or even customer

specifications. Audit determinations are based on evidence gathered through observation, data records, and interviews in the field. Where audits reveal nonconformances, or even opportunities for improvement (e.g., based on identification of threats or weaknesses), the organization can roll out an action plan to advance the system.

Management review takes place when top management takes a critical look at the system. The aim of management review exercises is to assess how effective the system is and to decide how it should be improved. Considerations usually include audit findings, customer feedback, nonconformance information, and process performance data, though many other pertinent inputs may be brought to the table. Management review is a critical enabler of improvement as it allows those in the driver's seat to take stock of shortcomings and opportunities, determine how to adjust the direction in which the company is being steered, and where to allocate resources to support any changes.

Though audits and management reviews mightily support system improvement, there are a host of ways in which minuscule continual improvement adjustments take place from day to day. Though so incremental as to be almost indiscernible at times, tiny amendments and adjustments can amount to meaningful positive change. The PDCA cycle itself is a continual improvement tool worth noting, since the practice of continuously comparing performance to targets and making contingent plans for the next cycle drives the company to do better in each iteration. Management systems sometimes include problem-solving approaches that seek to analyze root causes. Cause and effect diagrams, scatterplots, histograms, and control charts are some quality tools that can also help companies in their quest for improvement.

## Possible Integration Structure

Integration requires considerable coordination within the organization and is only possible when there is mutual trust and sharing. Integrated processes must be aligned with shared goals and a shared vision, in order that the organization's ultimate strategy can come to fruition. The advantages of integration include more efficient and effective use of resources, greater cross-functional involvement in company operations, enhanced information flow, improved organizational flexibility and responsiveness, and improved financial position.

Decisions must be made as to how the integrated system will function, bearing in mind the above considerations. Systems may be integrated to different extents depending on the preferences and needs of each individual company. One such integration structure, illustrated in Table 3, reflects that some parts of the integrated system might be shared, while others might fit only one or a few component systems.

Oversight elements like vision and organization structure may apply across all component systems, while others, like policy, may vary (e.g., the quality policy would be different from the safety policy). Full system integration could be established for some system processes (e.g., for document control), while only partial integration may be possible or desirable for others (e.g., risk management, where different approaches to risk control such as failure mode and effects analysis (FMEA) or the HSE's (2014) five steps to risk assessment could be practiced in different component systems). Finally, the company's approach to continual improvement might include management review and audit, which would have similar purposes and approaches across all component systems. Therefore, these would be fairly straightforward to integrate fully.

True system integration is only achieved when at least 70% of main processes have been integrated and those processes are under the control of single owners (Kymal et al. 2015). In the example illustrated in Table 3, there are some major differences in the risk management process for each component system, so it has been reflected as only 25% integrated. Nonconformance management is scored at 75% as it is fully integrated for

**Integrated Management Systems, Table 3** An integrated system example

| | IMS element | Integration | QMS | EMS | OSHMS | FSMS |
|---|---|---|---|---|---|---|
| Oversight | Vision | Yes | Shared | Shared | Shared | Shared |
| | Policy, goals, objectives | No | Unique | Unique | Unique | Unique |
| | Organization structure | Yes | Shared | Shared | Shared | Shared |
| Main processes | Document control procedure | 100% | Shared | Shared | Shared | Shared |
| | Training | 100% | Shared | Shared | Shared | Shared |
| | Nonconformance management | 75% | Q/E/OSHMS shared | Q/E/ OSHMS shared | Q/E/ OSHMS shared | Some variation |
| | Risk management | 25% | Some variation – probabilistic approach used | Some variation – EIA/FMEA used | Some variation – HSE five steps used | Some variation– HACCP steps used |
| | Corporate responsibility | 100% | Shared | Shared | Shared | Shared |
| Continual improvement | Management review | Yes | Shared | Shared | Shared | Shared |
| | Audit | Yes | Shared | Shared | Shared | Shared |

the QMS, EMS, and OSHMS, but not for the FSMS, which has retained some differences. The remaining three (3) processes are considered fully integrated by the company, and they are thus scored at 100% each. Assuming that any one shared process is controlled by a single person, Table 3 is reflecting a system that is about 80% integrated. This is calculated by considering the degree of integration of each of the five (5) main processes in the following way: (100% + 100% + 75% + 25% + 100%) / 5 = 80%.

### IT Applications

Companies are increasingly relying on information technology to make their management systems easier to access, maintain, and control. A system that is hosted online or on an intranet eliminates the need to update paper-based versions, allows access to documents and data in real time, and facilitates document and data editing and control by those authorized to do so. This boosts information availability, consistency, and accessibility, enhances employee involvement in system operations, and reduces work involved in managing the system. Therefore, hosting the IMS electronically could add value and lower costs.

## Conclusion

Integrated management systems have the potential to bring meaningful advantages to an organization. These include the sharing of features and information across a wide cross-section of company groups, thus enhancing organizational memory (Perez and Ramos 2013) and the breaking down of silos that would otherwise exist to support non-integrated management systems.

# Integrated Model of E-Participation

Bernd W. Wirtz, Peter Daiser and Boris Binkowska
German University of Administrative Sciences Speyer, Speyer, Germany

## Synonyms

E-consultation; E-democracy; E-voting

## Definition

E-participation is a participatory process that is enabled by modern information and communication technologies and includes stakeholders in the public decision-making processes through active information exchange, thus, fostering fair and representative policy-making.

## Introduction

The roots of e-participation can be traced back to the 1960s (compare for the following Wirtz et al. 2018). At that time, the concept of citizen participation started to become an instrument used by governments to enhance governmental legitimacy, foster public trust in government, and improve transparency of decision-making processes (Lourenço and Costa 2007; Fedotava et al. 2014). Around the turn of the millennium, citizen participation entered a new era. The spread of information and communication technologies (ICT) changed the way individuals, organizations, and governments used to communicate and interact (Mc Grath et al. 2011; Alawneh et al. 2013).

Given the growing public interest to enhance government transparency and accountability, governments around the world started to utilize the potential of ICT for citizen participation to increase overall participation, enhance the quality of public policies, and improve public stakeholder information and empowerment (Phang and Kankanhalli 2008; Millard et al. 2009; Peristera et al. 2009). Achieving these goals, while applying new technologies for citizen participation initiatives, challenges governments in a multifaceted way. For this purpose, Wirtz et al. (2018) recommend an integrated strategic e-participation framework that visualizes the key components that need to be considered in order to systematically address the requirements of e-participation initiatives.

## Integrated Strategic E-Participation Framework

Governments need to take into account particular strategic and organizational factors (e-participation targets, e-participation forms, e-participation strategies, e-participation

**Integrated Model of E-Participation, Fig. 1** Integrated Strategic E-Participation Framework

instruments, and e-participation demand groups) as well as environmental drivers (accountability, transparency, stakeholders, and technology) before initiating an e-participation initiative. If any of these aspects are neglected, this may prevent the unfolding of the full e-participation potential. Important factors and drivers for successful e-participation initiatives, which are outlined in the following, are summarized in the Integrated Strategic E-Participation Framework of Wirtz et al. (2018) in Fig. 1.

## E-Participation Targets

Successful e-participation requires effective target-setting. In other words, the target(s) of an e-participation initiative should be explicitly clarified before initiating the e-participation initiative. In general, there are six types of e-participation targets: (1) increase overall participation, (2) enhance information provision, (3) improve quality of public policies, (4) strengthen public trust, (5) improve and share responsibility for policy-making, and (6) raise public awareness and understanding for policy issues (Wirtz et al. 2018).

## E-Participation Forms

There are different e-participation forms. A widely accepted categorization for public participation was established by the International Association for Public Participation (IAP2 2007), which covers the spectrum of interactions between the government and the community (Vogel et al. 2014). They propose the following five

categories: (1) information, (2) consult, (3) involve, (4) collaborate, and (5) empower. Information refers to providing balanced and objective information to the public. The category consult specifies the form of interaction, in which the community provides feedback and expertise to the e-participation provider. Involve means that the government interacts directly with the community and that the concerns and aspirations of the community receive particular attention. In collaboration settings, the government incorporates public input by partnering with the public. If the e-participation provider chooses the form empower, which reflects the highest degree of interaction between the government and the community, the final settlement of the underlying public decision-making process stays with the community (IAP2 2007). Since the e-participation form has a strong influence on the interaction and operation of the cooperation/collaboration between the government and the community, it is an important aspect, which should also be clarified before initiating an e-participation initiative.

## E-Participation Strategies

Concerning the e-participation strategy, an e-participation provider may choose between three different strategies: an isolated, a combined, or an integrated strategy. Choosing an isolated strategy means that the e-participation strategy is characterized by a low integration of e-participation instruments. Thus, the use of these instruments follows a loose, independent structure. The combined strategy requires a more sophisticated approach since the e-participation instruments used – although still managed individually – are applied in an interconnected style, trying to use them in a synergetic way. In the integrated approach, all e-participation instruments are fully harmonized, meaning that they are applied in a complementary way. Although the integrated strategy constitutes the most sophisticated approach and requires the highest level of e-participation integration and coordination competence, it also allows the highest utilization of e-participation potentials.

## E-Participation Instruments

Based on the pursued e-participation target(s), e-participation form, and e-participation strategy, the e-participation providers can select suitable e-participation instruments. Here, the Integrated Strategic E-Participation Framework uses the categorization of Tambouris et al. (2007), who divide the range of e-participation instruments into 17 categories (for public channels see also Wirtz and Langer 2016). The selection of the e-participation instruments should reflect a goal-oriented and recipient-friendly composition, which particularly takes into account the targeted e-participation demand groups since their engagement is the core of any e-participation initiative (Gummerus et al. 2012).

## E-Participation Demand Groups

The e-participation demand groups can be seen as the target groups of the e-participation initiative. The categorization of the e-participation demand groups of the Integrated Strategic E-Participation Framework follows the categories of the E-Government Value Activity System of Wirtz and Daiser (2017). In their model, they classify the public target groups into citizens, private organizations, and public organizations. Since the e-participation demand groups are at the core of any e-participation initiative, the success of these undertakings stands and falls with their engagement (Gummerus et al. 2012). Moreover, there usually exists a strong relation between the e-participation targets and the e-participation demand groups since the e-participation targets – to a large extent – depend on the behavior and perception of the demand groups.

From an enabler perspective, it is an essential prerequisite that the e-participation providers take into account the skills and the situation of the e-participation demand groups (Albrecht

et al. 2008). For example, do they have technical access, the necessary competences, and the experience required? Moreover, can they achieve the expected benefits? After all, the participants have to be able and enabled to engage in and benefit from an e-participation initiative. Apart from these strategic and organizational factors, there are further aspects that successful e-participation initiatives should take into account.

## Drivers of E-Participation

Besides being an e-participation target, transparency is also seen as an important e-participation driver. A high degree of transparency shall, for instance, reduce governmental misconduct (Etzioni 2010) and enhance public trust (Kweit 2004; Vigoda-Gadot 2006; Wang and Wan Wart 2007; Kim and Lee 2012). Accountability is another driver for e-participation. It may be regarded as an institutionalized relationship that ensures that governments can be hold responsible for their actions and disclose results transparently (Bovens 2006). Both drivers are closely linked, since they are mutually dependent and reinforcing (Maor 2004; Kim et al. 2009).

Given the constitutive character of ICT for e-participation, technology can be considered an essential driver of e-participation. First, because it provides the technological foundation for e-participation initiatives (Chadwick 2003) and second, because the advent of social media technologies has accelerated the impetus for governments to enhance transparency, collaboration, and civic participation (Bertot et al. 2010; Evans and Campos 2013). Finally, stakeholders are a further e-participation driver. This driver includes e-participant demand groups as well as e-participation service groups, such as public officials or politicians (Aichholzer et al. 2007). Their input and their pressure exerted are crucial for the (further) development of e-participation initiatives (García-Sánchez et al. 2011) and the enhancement of communication and participation in political processes (Hart and Teeter 2003; Bekkers 2004; Best and Krueger 2005; Curwell et al. 2005).

## Conclusion

Summarizing, e-participation is a participatory online process that includes stakeholders into public decision-making to foster a fair and representative policy-making (Wirtz et al. 2018). In this context, e-participation can also be seen as an instrument to better harness the potential of ICT within citizen participation initiatives and enhance joint policy-making. Thus, government and citizens can become partners and share the responsibility for decisions.

To maximize the outcome and benefits of e-participation initiatives, e-participation providers should follow a clear and systematic development process that covers e-participation targets, e-participation forms, e-participation strategies, e-participation instruments, and e-participation demand groups, as well as the respective e-participation drivers. If these aspects are not systematically considered and determined before an e-participation initiative is launched, it is likely to fail since set e-participation targets will probably be missed and the concerns and aspirations of the public may not only be insufficiently included.

Successful e-participation puts the spotlight on the respective demand groups, which are the core of any e-participation initiative, and combines an adequate strategic and operative selection of instruments that enable the respective demand groups to participate in the initiative. From an e-participation provider's perspective, choosing the right channels is extremely important since they are the interface to the community. The channel(s) must fit the preferences of the targeted demand groups and support the desired e-participation target, form, and strategy.

# Integrated Reporting

Sotirios Karatzimas
Department of Business, Universitat Autònoma de Barcelona, Barcelona, Spain

## Synonyms

Nonfinancial information; One report; Value creation

## Definition

Integrated reporting incorporates in one single report information regarding the major resources and relationships that interrelate with the reporting entity and which are presented in the form of six capitals: the financial capital, the manufactured capital, the human capital, the social and relationship capital, the intellectual capital, and the natural capital. It is a form of communicating how an organization creates value over time, targeting to the creation of stronger connections between the various different activities of a business. The concept was born within the private sector context, but recently increased interest is recorded about its usability to the public sector as well.

## Introduction

The modern economic and political environment asks for information that goes beyond financial reporting; there is a demand for reporting entities to overcome the barriers of traditional reporting and to proceed in further engaging with their stakeholders, through the provision of a plethora of useful financial and nonfinancial information.

During the last years there has been a trend, especially within the private sector, to prepare reports that would provide, apart from the traditional financial information, additional alternative information. For instance, corporate social responsibility reports, sustainability reports, and environmental reports serve toward that direction. This trend comes in line with the accountability and transparency obligations of reporting entities. Although these nonfinancial reports coexist with financial reporting, they are not interconnected to each other so as to provide an overall understanding of how an organization operates. Therefore the usefulness of this information is in many cases limited because it is dispersed. The modern era requires not only disclosure of additional nonfinancial information but also interrelationship between financial and nonfinancial information.

Integrated reporting comes to overcome this barrier. The idea behind integrated reporting is the development of "one report," i.e., a single official document that would contain information of both the financial and nonfinancial issues of an organization (Eccles and Krzus 2010). This information is interconnected thus facilitating better assessment of future performance and prospects of the reporting entity. The common ground of this information is that it helps to explain how the entity creates value. Therefore, integrated reporting is a form of communicating, to those interested, how an organization creates value over time (IIRC 2013). At the same time, this communication tool also targets to the creation of stronger connections between the various different activities of a business. Thus integrated reporting is considered to be a fundamental development for decision-making purposes, which is encouraged to be performed based on various performance data.

Integrated reporting has gradually gained popularity and supporters among various countries. For instance, the stock markets in South Africa and Japan ask from listed firms, among other requirements, to provide an integrated report, while at the same time many large firms around the world choose to voluntarily adopt integrated reporting: the Coca-Cola Company, Deutsche Bank, Marks & Spencer, Microsoft Corporation, and Unilever, among others.

Although at its beginning the concept of integrated reporting was born and developed within the private sector context, recently there is a lot of debate about the potential usability of this reporting type to the public sector as well (Bartocci and Picciaia 2013; IIRC 2013).

The purpose of this entry is to introduce the concept of integrated reporting in the public sector. The text proceeds in section "Overview: The Philosophy of Integrated Reporting," with an overview of integrated reporting focusing on value creation and the six capitals. Section "Integrated Reporting in the Public Sector" refers to the introduction of the integrated reporting concept in the public sector context, and section "Developing an Integrated Report" to the development of the integrated report. Finally, section "The Issue of Assurance" comments on the issue of assurance of integrated reporting, and section "Conclusion" concludes.

## Overview: The Philosophy of Integrated Reporting

Integrated reporting promotes the use of a single report that will provide a holistic view of the activities that create value for an organization over the short, medium, and long term (IIRC 2013). This new type of reporting incorporates additional nonfinancial information.

Overall, integrated reporting is based on three fundamental concepts: "Value creation," the "six capitals," and the "business model." Briefly, "value creation" refers to the process of generating value through an organization's activities by using its resources. The "capitals" are various forms of resources and relationships that interact with the organization. Finally, the "business model" refers to the development of a strategic approach by the organization to successfully perform its business activities within a specific environment (IIRC 2013).

### Value Creation

"Value creation" is one of the fundamental concepts underlying integrated reporting. Organizations can create value through the effective management of their resources in the short, medium and long term. These resources are recognized within six capitals: the financial, the manufactured, the intellectual, the social and relationship, the human, and the natural capital. These "six capitals" represent the holistic approach of integrated reporting and the transition to "integrated thinking" inside the organization. The creation of value is recognized through the changes that occur in the "six capitals," deriving from the activities and processes of the organization. The business activities of an organization might create, modify, or destroy these capitals. For a simple example, one could refer to the functioning of the financial capital. The financial returns toward the providers of capital to the organization, and the impact on the other capitals and other stakeholders are expressions of value. Generally, value is created not only for the organization itself but also for the stakeholders and the society (Eccles and Saltzman 2011).

Through integrated reports the reporting entity provides to stakeholders information regarding the creation of value through its processes and activities. In other words, an integrated report explains how the organization creates value over time through interacting with the external environment, the relationships with stakeholders, and the various capitals. Moreover, it gives answers on how these capitals were used in order to produce results and whether their use eventually led to the creation or not of value. It is a communication tool informing how value is created by connecting different types of information. In any case, the reporting organization should clearly state in its integrated report how it defines value, what actions took place in order to increase value creation, and how stakeholders and the capitals are related to value (Adams 2013).

### The "Six Capitals"

Traditional reporting of private sector firms involves the reporting of mainly financial information. Nevertheless, various other reports have been developed over time in order to provide information about issues that also touch on other nonfinancial resources and relationships. For instance, the corporate social responsibility report and the sustainability reports target to the provision of information regarding the performance of the firm through a social and environmental perspective. The integrated report comes to connect all these types of information in one single report. The major resources and relationships that

interrelate with the organization are presented in the form of the "six capitals." These are:

1. The financial capital
2. The manufactured capital
3. The human capital
4. The social and relationship capital
5. The intellectual capital
6. The natural capital

These "six capitals" take part in the business activities, and their shape and form are affected by these activities; they might be consumed, transformed, or modified. In any case, these capitals are not of equal relevance for every organization. They might not even be applicable to every organization. This is left to the discretion of the organization itself. The characteristics of these capitals are briefly presented in the following paragraphs (IIRC 2013):

1. The **financial capital** refers to the funds that are available to the reporting entity. These funds are used in the process of producing goods and providing services. They are acquired through self-financing, borrowing or grant receiving, or generated through the entity's operations and investments. Usually they can be distinguished as debt or equity financing, depending on their source.
2. The **manufactured capital** refers to the physical objects that an entity uses in order to produce goods and to provide services. These physical objects include buildings, equipment, and tools, as well as infrastructure. The items that fall in this category might even not be owned by the organization.
3. The **human capital** incorporates the skills, knowledge, and abilities of the people who constitute the organization's personnel, i.e., employees and managers. It further involves people's experience and motivations to innovate. These competencies are acquired through training and education.
4. The **social and relationship capital** regards the organization's ability to establish institutions and relationships within and between each community, group of stakeholders, and other networks. The scope is to enhance the well-being of individuals as well as of the community in total. To achieve that it is necessary to build up relations based on loyalty and trust.
5. The **intellectual capital** contains the intellectual property and the organizational capital of the organization. These are knowledge-based intangible assets that provide competitive advantage to the organization. More specifically, examples of intellectual property are the patents and copyrights, while examples of the organizational capital are the organization's tacit knowledge, procedures, protocols, etc.
6. Finally, the **natural capital** refers to the environmental resources that surround the organization, such as the air, water, land, as well as the biodiversity and ecosystem health. These resources could be either renewable or nonrenewable.

All these characteristics contribute – or affect – to a great extent the organization's development. Furthermore, from the above definitions, two major categories of capitals may be formed: tangible capitals, i.e., financial and manufactured capitals, and intangible capitals, i.e., human, social, and intellectual capitals. These broader categories operate within the context of the natural capital.

## How Integrated Reporting Operates: The Business Model

A business model is the system developed by each organization that sets the organization's strategy and strategic goals in accordance to its business activities (IIRC 2013). It also provides the plan that will help the organization to achieve these goals. The business model should be harmonized with the specific external environment conditions under which the organization operates.

The business model uses as its main input the "six capitals." Through the business activities, the inputs from the capitals are turned into outputs and results. Eventually, the business activities and the outputs will produce outcomes that will affect the "six capitals." In order to gain an understanding of the effectiveness of the organization's

strategy and the adapted business model, the use of the integrated report is crucial (Eccles and Krzus 2010): it provides past and actual values of the outputs and outcome of the business process, which are especially helpful for in-depth analyses. These data are assessed through their comparison with historical trends, market expectations, strategic goals, competitors' performance, etc. If the results are not satisfying, this procedure could lead to the change of the business model. Figure 1 depicts how integrated reporting operates through the value creation process.

## Integrated Reporting in the Public Sector

### Raising the Interest

As previously mentioned, the idea of integrated reporting was born within the private sector context. The nature of the private sector and its for-profit orientation nourished the conception of this new reporting philosophy (Adams and Simnett 2011). This context facilitated the early development and widespread adoption of international accounting standards, therefore promoting the homogeneity in private sector reporting. In this direction, the convergence project between International Financial Reporting Standards (IFRS) and the US Generally Accepted Accounting Principles (US GAAP) works toward the elimination of existing differences in financial reporting around the globe. Therefore, the private sector provided a fertile ground for the development of integrated thinking.

On the other hand, reporting in the public sector at the global level presents great diversifications. The multiplicities can be observed both between and within countries (e.g., between different government levels), where four financial reporting models are widely used: cash basis accounting, modified cash basis accounting, modified accrual basis accounting, and accrual basis accounting. Such diversity has widened the discussion regarding the role of reporting in the public sector. Within the extremely diversified context of financial reporting in the public sector, the idea of an integrated reporting might sound as being too ambitious. Nevertheless, in the last years, there has been a lot of debate in favor of such a move (Adams and Simnett 2011; Bartocci and Picciaia 2013).

**Integrated Reporting, Fig. 1** The value creation process (Source: International Integrated Reporting Framework (IIRC 2013, p. 13))

To begin with, in the last decade, disclosing of nonfinancial information has increased in the public sector through various forms of reporting (Veltri and Silvestri 2015). In most cases, these reports were adapted from the private sector where they were previously applied with success. A few examples are the use of the balanced scorecard and of performance measurement reports, where performance measures are used for strategic purposes, the social reports, the sustainability reports, and the environmental reports for relevant reporting purposes.

Although the importance of providing such information cannot be denied, so far their application in the public sector is not the norm (Bartocci and Picciaia 2013). Nevertheless, they might be used as a basis of a smooth adaptation of integrated reporting in public sector entities. Among the various benefits of such a move are (Bartocci and Picciaia 2013): the boost of reporting on service delivery and governance excellence from a different standpoint than the financial one; the provision of valuable explanations on the public sector entity's strategy, governance, and organization model; and the creation of a stronger bond with accountability.

### Value Creation and the "Six Capitals" in the Public Sector Context

Integrated reporting may broaden the understanding of how public sector entities operate and create value. In this context, the term "value" refers to the public value created by the capitals (Bartocci and Picciaia 2013). In the public sector, the concept of "value creation" should be related to the three Es: economy, effectiveness, and efficiency.

Apart from information regarding financial capital, which derives from the financial reports of the public sector entities, information for the other five capitals is scarce in public sector reports. However, the provision of additional nonfinancial information in the public sector serves a strategic orientation and could lead to a more complete and meaningful reporting (Adams and Simnett 2011). As the issues of property are rather complicated in the public sector, information on manufactured capital would be very useful. Manufactured capital could refer to information regarding the composition, value, and use of the "available assets" (e.g., buildings, infrastructure) (Bartocci and Picciaia 2013). It is beyond any doubt that the human capital is the driving force of the public sector. Employees and managers in public sector entities comprise the fundamental resource of this sector. Therefore it is very important to know and be informed on issues of training, education, as well as ethics and corruption. In the same realm, the social and relationship capital is closely associated with public sector's social function (Bartocci and Picciaia 2013). Information could be therefore provided on the relations and collaboration of the reporting entity with its stakeholders, as well as on the legitimacy of the entity toward the public. Intellectual capital could promote the provision of information regarding the organizational capital, i.e., management and technical processes, management philosophy and culture of the public sector entities, as well as to issues of intellectual property, such as of patents. Finally, the natural capital will reflect the issues of environmental resources.

The differences between the private and the public sectors (e.g., nonprofit orientation, absence of a market) highlight the different approaches in introducing integrated reporting in the public sector. Due to these inherent differences among the two sectors, various adjustments will have to take place (Abeysekera 2013). Flexibility is therefore suggested during the adaptation process of integrated reporting in the public sector.

## Developing an Integrated Report

The development of an integrated report should follow certain guidelines. In 2013 the International Integrated Reporting Council (IIRC) produced a framework for the preparation of an integrated report (IIRC 2013). The IIRC was formed in 2010 with the aim to promote the concept of integrated reporting. At first the focus was mainly on private sector firms, but gradually the interest turned also to the possibility of transposing these concepts into the public sector as well. For that purpose the Integrated Reporting Public Sector Pioneer Network has been established in November 2014 (Patterson 2015). The scope of this pioneer network is to explore the value

creation process, identify material issues, as well as explore the need for specific guidance in the public sector context. Members of the network include among others the United Nations and the World Bank.

According to the IIRC Framework (IIRC 2013), the preparation of an integrated report has to comply with several principles. In general, an integrated report should include eight content elements. These elements are interrelated and not mutually exclusive:

1. **Organizational overview and external environment**. This part refers to the description of the organization, its business orientation and activities, as well as the presentation of the external conditions within which the organization operates.
2. **Governance**. It presents the organization's governance structure and its relation to value creation.
3. **Business model**. This element presents the business model that is adopted and followed by the organization.
4. **Risks and opportunities**: This part involves the recognition and discussion of the specific risks and opportunities that the organization faces. These risks and opportunities affect the creation of value overtime, so it is important to discuss the ways in which the organization deals with them.
5. **Strategy and resource allocation**. This part deals with issues of strategic planning regarding the organization's goals and the ways to achieve them.
6. **Performance**. It refers to the evaluation of the organization's performance in achieving its objectives within a period. In this process the outcomes are assessed in terms of their impact on the capitals.
7. **Outlook**. This part describes the challenges and uncertainties that the reporting entity will have to face while trying to achieve its strategic goals, as well as their impact on the business model and its future performance.
8. **Basis for presentation**. This part presents the basis under which the reporting entity decides on what should be included in the integrated report and how this is quantified and measured.

While developing an integrated report, the content and information presented should also follow specific guidelines which apply to both private and public sector entities (IIRC 2013). For example, the reported information should be material, concise, complete, reliable, consistent, and comparable. The content should focus on the organization's strategy referring to significant risks and opportunities, its use of the "six capitals," the provision of a holistic view of the various interrelations the organization is involved in, and the nature and quality of its relations with its stakeholders.

## The Issue of Assurance

The objectivity in developing integrated reports constitutes a critical issue. Integrated reports, either in the private or eventually in the public sector, are not audited by the typical auditing process performed to the publicly available financial statements. Therefore, it is difficult to assess whether the information they disclose is free of bias and material omissions and is nonselective. It is important to create mechanisms that will assure for the credible and reliable presentation of information, in order to protect the users of this information. Internal audit procedures play a key role in safeguarding the quality of the provided material (CIIA 2015). Moreover, the development of compliance assessments and performance certifications that will report on the quality or the level of performance, as it is suggested by the IIRC (2013), is also very important. Finally, it is essential for the integrated report to be accompanied by a statement written by those in charge of governance, ensuring the users of the integrity of the report, as well as its compliance with the IIRC Framework (IIRC 2013).

## Conclusion

Integrated reporting is a modern reporting trend that provides a holistic view of an organization's value creation process over time. It uses the integrated report as a communication tool. The integrated report focuses on the provision of

information about the organization's strategy, governance structure, and performance, within the specific external conditions posed by the environment in which it operates. In order to support the preparation of an integrated report, certain guiding principles have been developed by the IIRC Framework. The philosophy of integrated reporting builds on the development of one single report that will eventually become the main report of the organization. Eventually, this will connect the information regarding both financial and non-financial matters, presenting the process of value creation inside the organization and at the same time facilitating future performance assessment. The reports would provide a holistic, useful, and meaningful information set, allowing the reporting entity to successfully fulfill its reporting obligations toward stakeholders. Along with private sector firms, recently, public sector entities also move beyond the traditional barriers of governance, management, and financial reporting toward integrated reporting. In this realm, a number of public sector entities globally start to consider the use of more holistic communication tools and broader ways to measure economic growth and impact (IIRC 2014), as the new economic era asks for the provision of alternative information to facilitate internal and external users in sound decision-making.

# Integrating Traditional Medicine (TM) in the Healthcare System of Bangladesh: Issues and Challenges

Md. Abul Hossen[1] and Md. Habibur Rahman[2]

[1]Jagannath University, Dhaka, Bangladesh

[2]The People's University of Bangladesh, Dhaka, Bangladesh

## Synonyms

Cultural competence; Cultural sensitive health care; Dominance; Equities in health; Globalization; Health for all; Health human resources;

Healthcare management; Human rights; Participation in health; User perspectives

## Definition

**Integration** Integration means the process of adapting, adjusting, absorbing, or incorporating the TM with Modern (Western) healthcare system.

**Health System** It is the organization of people, institutions, and resources that deliver healthcare services to meet the health needs of target population.

## Introduction

Providing medical care is a constitutional obligation of the government of Bangladesh. The Constitution mandates that: "it shall be a fundamental responsibility of the state to attain, through planned economic growth, a constant increase of productive forces and a steady improvement in the material and cultural standard of living of the people, with a view to securing to its citizens (a) the provision of the basic necessities of life, including food, clothing, shelter education and medical care" (BMOP 1998). Article 16 of the constitution also mentions that the state shall adopt effective measures to reduce disparity in health care progressively. Over the past decade, the Government of Bangladesh has made strong policy commitments to improve the health of the nation. The International Conference on Population and Development, Cairo (1994) and subsequent international conferences in Beijing (UN 1995) and Copenhagen (2004) created a high degree of awareness of health, equality of health, and health rights issues among civil society and policy makers in the health sector. As a consequence of the efforts of civil society and the government to bring greater awareness to the health sector, a number of policies now address the health needs of the country. They include the Poverty Reduction Strategy Paper [PRSP] (2005), the Health and Population Sector Program [HPSP] (1998–2003), the National Policy for Advancement of Women [NPAW] (2006), Millennium Development Goals [MDG] (2004), and the Sustainable Development Goals [SDG].

Development and expansion of healthcare facilities have been an integral part of public policy since independence to improve the health status of the Bangladeshi population. The government has introduced various programs in the 5-year plans to achieve its constitutional commitment of achieving "health for all." One of the major programs is capital investment to develop a health infrastructure that includes community clinics for every 6000 populations, Union health and family welfare centers, Thana Health Complex, district hospital, medical college hospitals, and other specialized institutes and hospitals throughout the country. There are about 14,000 Community Clinics (CC) and 4062 Union Health and Family Welfare Centers (UHFWC) now functioning in the country. The UHFWC is a permanent facility with daily outpatient services and headed by a medical officer. Additional staff includes a family welfare visitor, family welfare assistant, health assistant, sometimes a pharmacist, and two support staff (BMOHFW 2005). In each rural thana there is a Thana Health Complex which is a permanent facility offering daily health and family welfare services for in- and outpatients as well as supervision of other health services within the thana. It was planned to establish a total of 397 THCs in the country, 390 of which have so far been made operational. Sixty-four districts have so far constructed a hospital. Each of these hospitals has a bed capacity of at least 50–200, with a few already upgraded to 250-bed hospitals (BMOHFW 2005). There has been a notable expansion in the number and availability of health service institutions as well medical personnel over the last decades. Between 1975 and 2012, the number of government hospitals has increased from 131 to 690 and the number of private beds has increased from 15,452 to 43,818 (MOHFW 2015). That is, the number of government hospitals has increased nearly sixfold during the last quarter century, while the bed strength has more than doubled. These developments have clearly improved physical

accessibility of healthcare facilities to the people. But most of these centers lack laboratory facilities, required manpower, equipment, and furniture. A survey of 16 UHFWCs shows that 63% had inadequate physical facilities, 60% had inadequate personnel, and 80% faced shortage of supplies or vaccines (Shahen et al. 2020).

While the government counts the number of buildings constructed in assessing its performance in the sector, the creation of these facilities has not ensured services to the population irrespective of place and class, that is, rich and poor (Shahen et al. 2020). Despite the government's serious commitment to deliver health facilities to the doorsteps of common rural people through innovative approaches, the utilization of health services in rural areas is still far below any acceptable standard (Hossen and Westhues 2011a). The coverage and quality of services remain uneven, largely because of inequitable location and allocation of services, lack of drugs, equipment and personnel, inadequate supervision, problems of physical inaccessibly, and lack of culturally sensitive services (Hossen and Westhues 2011b). As a result, in spite of the development of an extensive network of a modern healthcare delivery system all over the country, traditional healing systems still play a significant role in delivering healthcare at the community level. Ahmed (2005) reported that various indigenous practitioners constitute the largest group of healthcare providers of rural Bangladesh. Traditional health care is not only more accessible than Western-type health care, but is a commonly preferred form of treatment in rural Bangladesh. Study consistently confirms that, on an average, only about 20–25% of the people have access to modern healthcare facilities, and the remaining 75–80% of the rural population in Bangladesh still receives healthcare services from the traditional medical practitioners (Uddin et al. 2010). The use of these practitioners has greater significance for local people because of the long tradition, reportedly effective outcome, and their long-held belief in its effectiveness (Uddin et al. 2010). In this situation the government could substantially increase access to health services by integrating vast pool of traditional health providers into the modern, publicly funded healthcare system (Hussain and Malik 2013). Training about the importance of culturally sensitive practices would need to be introduced in university curricula and in continuing education programs for physicians and other health workers if traditional healers are to be valued and accepted as legitimate member of a health care team. Many countries now recognize the need to develop a cohesive and integrative approach to health care that allows governments, healthcare practitioners and, most importantly, those who use healthcare services, to access in a safe, respectful, cost-efficient, and effective manner (Hussain and Malik 2013). World Health Organization (WHO) also made an appeal to foster its appropriate integration, regulation, and supervision to develop a proactive healthcare policy (Bannernman and Ossy 1982). Therefore, there is a critical need to mainstream Traditional Medicine (TM) into healthcare system to achieve the objective of improved access to health care facilities while preserve and respect the cultural diversity.

In this backdrop, the first section of the chapter will focus on the existing healthcare delivery systems of Bangladesh. Through a review of existing literature it will try to show that two competing systems, for example, Western and Traditional Medicine (TM) systems, working side by side in spite of the governments patron and massive support toward the Western system. The second section will provide an overview of TM in the context of Indian subcontinent and explain the struggle, challenges, debate, and tensions that it is facing and the urge for integration of this system with the Western one. The final section of the entry will sum up the debate and offer some recommendations to address the challenges of integration for the sake of development of an inclusive, respectful, and culturally diverse healthcare system.

## Types of Traditional Medicinal Practices in Bangladesh

Traditional Medicine (TM) is multidimensional, complicated and broad. It is related not only to health care but also to culture, history, belief, and

lifestyle of particular society. Sometimes TM is known as alternative to modern medicine or called nonconventional medicine in many countries. According WHO "TM refers to the indigenous health practices, approaches, knowledge and beliefs incorporating plant, animal and mineral based medicines, spiritual therapies, manual techniques and exercises, applied singularly or in combination to treat, diagnose and prevent illnesses or maintain well-being" (WHO 1996).

*Ayurveda/Ayurvedic Medicine: Ayurveda/Ayurvedic* medicine is one of the world's famous systems of medicine. *Ayurveda* is broadly known as science of life, *Ayur* means "life" and *Veda* means "knowledge." In the *Ayurveda* herbs and plants are important elements but the system also considers many other elements of lifestyle such as foods, aromas, germs, colors, yoga, lifestyles, and surgery. *Ayurveda* perceives the human body as a composition of three main elements – *dosas, dhatus*, and *malas. Dosa* involves three components – *vata* (wind), *pitta* (gall), and *kapha* (mucus). *Dhatu* refers to seven elements: plasma, blood, muscle, fat, bone, bone marrow, and reproductive tissues. *Malas* means waste materials such as urine and sweat. According to *Ayurvedic* philosophy, sound health means the balance of *dosas*, *dhatus*, and *malas*, while their imbalance results in a disease.

*Unani Medicine: Unani* took over the fundamental theory traditional medicinal practices in the context of *Hippocratic* medicine and the doctrine of the humors. According to the doctrine of *Hippocratic* and *Unani* system, the body contains four basic elements Earth, Air, Water, and Fire which have different temperaments, that is, Cold, Hot, Wet and Dry. After mixing and interaction of four elements a new compound having new temperament comes into existence (Kutumbiah 1971). Like *Ayurveda*, *Unani* is also a humoral medical system. It believes that the human body is a composition of four fluids – *dam* (blood), *balghan* (phlegm), *safra* (yellow bile), and *sauda* (black bile) – and a healthy body means a proper balance of these elements (Rahmatullah and Biswas 2012). The balance of these body fluids creates a power of "self-preservation or adjustment" in the body. When this power weakens or the balance is disrupted people feel sick. In terms of healing a disease, *Unani* also suggests the restoration of soundness of the whole body like *Ayurveda.*

*Herbal Medicine (HM):* Herbal Medicine is considered as a part of TM and sometimes used to refer to the same definition. According to WHO general guidelines for Methodologies for Research and Evaluation of Herbal Medicine, Herbal Medicines include "Finished, labeled and medicinal products that contain as active ingredients aerial or underground parts of plants, or other plant material, or combination thereof, whether in the crude state or as plant preparations. Plant material includes juices, gums, fatty oils, essential oils, and any other substances of this nature. Herbal medicines may contain excipients in addition to the active ingredients" (WHO 1996).

## Historical Background of Traditional Medicine and Healthcare System in Bangladesh

TM is a major component of indigenous system of medicine in Bangladesh. TM includes *Ayurvedic* and *Unani* in Bangladesh which are well established since time immemorial. TM is an ancient form of health care, practiced long before the appearance of scientific medicine in the developing countries that includes Bangladesh (Lashari 1984). Bangladesh introduced medicine from several sources. The country was enriched in plant diversity, which gave advantage for herbal preparation from the beginning of the history. At the same time, it gained medical knowledge from home and abroad. Ancient Bangladesh passed through several historical periods as *Marian, Pala*, and *Sen*. The country practiced *Ayurveda* as a codified medical text early in the history. As a partner of Indian subcontinent, the country maintained *Ayurveda* for religious and healthcare purposes. Only in Bengal there was a separate caste, namely, *Baidya* or *Kabiraj*, who were the professional physicians since the *Marian* era. In the period of *Shasanka* (sixth century) and after his death *Ayurveda* played vital role in health care in this region.

*Ayurveda* and *Unani* were taught at home of *gorukula* (house of physicians) in the eighteenth century. During the eighteenth century, some important literatures on *Ayurveda* were written among the writings, Ananda Barma's *Sarkomudi,* Rajbllava's *Ratnamala*, and Ramsen's *RsendraSar* were famous. William Jones established Asiatic Society in this period, which was developed as a center for oriental knowledge. The society translated two prominent books *Charaka Samhita* and *Susrata Samhita* into English. Jones wrote Botanical Observation on selected Indian Plants (Pahari 2001).

Modern health care was introduced with the establishment of Calcutta Medical College (CMC) in 1835. Before 1835, medical schools of India produced mainly indigenous practitioners in *Ayurvedic* and *Unani* systems. They practiced mainly herbal formulation according to the formulation of the indigenous systems. In 1874, the government established Dacca Medical School (Alam 2007). Up to the middle of nineteenth-century health care in India was mainly concerned with curative treatment only. Though British rulers decried indigenous systems of medicine, but they were well aware of the fact that a vast majority of the Indian people believed in these systems and were treated by the indigenous practitioners. The government decided to utilize indigenous practitioners particularly in rural health care since 1867 (Jaggi 1980). After 1835, professionalization of allopathic medicine and standardization of drugs began. Western and indigenous medical training were separated in 1835 by the government order no. 28 of 28 January 1835 (Rahmatullah and Biswas 2012). Under the suppression of British rulers, a national movement was started by the end of the colonial rule. The indigenous practitioners and nationalists came forward and revolted to revive indigenous medicine systems with modern concepts. Among others, Hakim Azmal Khan (1863–1928) was the most prominent one. He emphasized formalization and institutionalization of indigenous medical teaching and of its contents. By the end of nineteenth century the number of indigenous practitioners was much more than western practitioners (Pahari 2001). In 1872 census of Bengal, the number of physicians was 3769 including surgeons and doctors on the other hand the number of *Baiyda* and *Hakim* was 23,700 (Jaggi 1980).

## Why the Integration Is Important?

Development and expansion of healthcare facilities has been an integral part of government policy to improve the health status of the Bangladeshi population (Rahman and Hossen 2017). Only the modern medical system has received formal recognition in official health planning in Bangladesh (Osman 2008). However, for many parts of the developing world, it is widely recognized that hospital services, particularly rural hospitals, have limited influence on improving the health standards of the community which they serve (Ahmed 2005; Hussain and Malik 2013). Eastwood and Hill's (2004) study in the Gambia revealed that the poor and women in their study reported to traditional healers more often than men and the rich, probably due to stronger traditional beliefs and the perception of increased confidentiality. Studies from Bangladesh consistently reported that poor people and women are less likely to select any modern medical provider when reporting sickness, and when they select a provider, they are more likely to choose traditional providers, especially in the rural areas (Roy and Rahman 2009; Biswas et al. 2006; Huq and Tasnim 2008). This may be because of the unresponsiveness of the modern health system with respect to basic amenities, inappropriate client-provider interaction, and staff attitudes (Hossen and Westhues 2012b) and lack of opportunity due to exclusion from health institutions, cultural and religious factors prohibiting women seeking care from male practitioners, distance, and excessive payments (Hossen and Westhues 2011a). Since most of the traditional practitioners have no appropriate training or knowledge about the treatment procedures and diagnostic system and hence capacity to provide basic curative services as well as lack of

rationale use of drugs and management of illness (Hossen and Westhues 2011a), very often valuable lives are lost or that caused delayed treatment (Roy and Rahman 2009) of life-threatening illness like bone setting and even cancer. Inappropriate or delayed health care leads to undesirable outcomes such as preventable morbidities and mortalities, effects recovery rates, medical complications, increases requirements for further treatment regimes, and amplified susceptibility to future illness (Hossen and Westhues 2013). Even when they see modern doctors they are so embarrassed or hesitant to tell their modern practitioners about their traditional medicating practices, and many of their physicians either did not want to hear about those practices or dismissed them out of hand as a result they continue to use both which might cause detrimental effects on body (Hossen and Westhues 2011a). Because of fatalistic attitude of the villagers, these unqualified providers are rarely blamed or held accountable for their poor practice (Hossen and Westhues 2013; Ahmed et al. 2009).

The traditional healthcare providers would appear to be ideal candidates to be trained to render primary healthcare services in a rural area like the community studied where healthcare resources are limited because of this relationship of trust (Ross 2008). The government could substantially increase access to health services by integrating these traditional health providers into the modern, publicly funded healthcare system. A major impediment to such an integration is the lack of respect by most modern healthcare providers for the knowledge or healing methods of traditional healers (Ross 2008). Training about the importance of culturally sensitive practices would need to be introduced in university curricula and in continuing education programs for physicians and other health workers if traditional healers are to be valued and accepted as legitimate members of a healthcare team. The gains for patients would be substantial if they were able to speak openly and freely about their consultations with traditional healers and their use of herbal remedies without fear of being judged (Hossen and Westhues 2012b).

Attempts have been made in other developing countries to achieve this integration. Roh marks that integration is a formalization of traditional medicine into mainstream healthcare system. He observes that a good example of integration of TM is in China where Traditional Complementary Medicine (TCM) is a formal, structured system, with a long history and tradition and with its own colleges, research institutes, and disciplinary controls (Roh 2000). In South Africa, for example, traditional healers see patients in publicly funded clinics. This allows patients to use both modern and traditional providers in one location, reducing the time required for treatment and ensuring that modern healthcare providers are informed about herbal medications that may interact with medications they prescribe (Motamela 2004). The South African government promulgated the Traditional Health Practitioner's Bill in 2004, legislation which recognizes the role that traditional healers play in that country, sets professional and ethical norms and standards, and regulates the practice of these healers (Motamela 2004). The regulations include testing and registering the remedies used by herbalists, registration of practitioners, and supervision to prevent malpractice (Motamela 2004).

## Challenges of Integration of Traditional Medicine in the Context of Bangladesh and Ways to Address

Traditional medicinal practice is a very common phenomenon among the low and middle income group of people in Bangladesh. Despite increasing utilization of "modern" (allopathic) healthcare services in Bangladesh with consequent reduction in mortality and morbidity traditional medical system still persist and exert a significant influence by competing with modern medicine (Meeting Report 2009; Hossen and Westhues 2013). Over the last two decades, rapid population growth, the current state of public health and consequently the need for medicine staff have led the policy makers to turn to the possibility of using a variety of indigenous healers now active in

the field of health care. Because it is used by a significant number of people throughout the country either as the only health resource available or a substitute for, or a complement to, allopathic healthcare services (Hossen and Westhues 2010). This will lead to the development of a new culture of "integrated" medicine by accommodating traditional healing practices, where possible, "modern scientific" medicine, as envisioned by WHO (2004).

In the context of Bangladesh, traditional or indigenous medicine requires specific policy guidelines or should have incorporation in the national health policy with importance so that the practitioners or receivers may have faith and satisfaction. There should be a way of integration among TM and modern healthcare system toward achieving the national goal of health for all. Although a Board of *Unani* and *Ayurvedic* medicines was created decades ago in Bangladesh to bring TM within the purview of the formal healthcare system, the plan has still not been fully implemented. The National Health Policy formulated by the government of the People's Republic of Bangladesh in 2011 significantly emphasizing on the development of modern healthcare systems mentions little about the traditional system or the role of TM in healthcare provision (Hossen and Westhues 2012b). However, policy-makers, health professionals, and the public at large are struggling with issues regarding the safety, effectiveness, and quality of TM. The vast pool of untrained practitioners must be trained, regulated, and supervised to ensure a minimum quality of primary care to people. Training of traditional providers in standard treatment and referral practices would be essential, as would the training of physicians, nurses, and other health workers to understand and respect the work of traditional healers. These regulatory mechanisms would ensure access to healthcare services that are consistent with the preferences of rural people and that quality services are delivered. China and India have successfully developed integration between TM and Western medicine in their respective healthcare systems. Considering these practically successful model, the following steps are recommended for mainstreaming the TM into public health system in Bangladesh:

- The vast pool of untrained practitioners must be trained, regulated, and supervised to ensure a minimum quality of primary care of people. Training of traditional providers in standard treatment and referral practices would be essential, as would the training of physicians, nurses, and other health workers to understand and respect the work of traditional healers.
- A proper monitoring and regulatory framework is required for the quality production and safe use of TM in Bangladesh.
- An appropriate medicine testing laboratories service must be introduced to ensure the quality of TM.
- Governments should take the necessary measures to strengthen drug administration to ensure the quality of TM.
- Use of traditional health practices needs further research – research that increases our understanding of the risks and benefits of the practices, factors affecting their use, and how to develop a positive working relationship between modern and traditional healers.

## Conclusions

Bangladesh has made remarkable progress on the health and nutrition-related Millennium Development Goals (MDGs), with major achievements in increasing immunization rates and reducing the rates of under nutrition, infant and under-five mortality, maternal mortality, and communicable diseases. Building on these successes, Bangladesh has now committed itself to achieving universal health coverage by 2032. Realizing this ambitious goal will require Bangladesh to intensify its efforts to address the different health challenges of its populations. As observed, there is a huge opportunity for the traditional healing practice to be incorporated and supplemented with the modern health care in Bangladesh. Bangladesh has signed the United Nations Sustainable Development Goals

(SDGs), which, among many other goals, obliges the country to provide health care to all, irrespective of social class, and to make human settlements inclusive, safe, and resilient. Bangladesh has also set the target to achieve universal health coverage (UHC) by 2032. However, unless action on the mutual cooperation between and among the professionals is prioritized and recognized and good quality service to the underserved segment of the population is ensured, achieving UHC and SDGs will be challenging. The World Health Organization (WHO) since 1976 has been pursuing to integrate traditional systems of medicine with the mainstream healthcare. The member countries of WHO have been suggested to frame policy about traditional medicine. Most of the countries have taken or been taking necessary steps to integrate TM into their respective national healthcare programs (Alam 2007). Now it is high time for Bangladesh to rethink and realize the potentials of TM and take necessary action to integrate the system into the national health care to achieve its long cherished dream "health for all."

# Integrating Values in the Public Sector

Alex R. Ingrams
Tilburg University, Tilburg, The Netherlands

## Synonyms

Organizational mission; Public service motivation; Public values; Regime values

## Definition

Integration of values in the public sector is the process of aligning and realizing public service goals and tasks within the context of core or essential government values.

## Introduction

The claim is often made that the public sector has a unique responsibility for upholding *public values*. The same claim is not made of the private sector or other non-governmental sectors such as civil society. While most public administration and public policy scholars support this view, the theoretical and empirical task of explaining why it is the case has led to a wide divergence in viewpoints. There are disagreements on what public value means, what the scope is of values in the public sector, and what tools can be used to integrate which values and to what outcomes. This entry summarizes the various viewpoints on what types of public values exist, how they might be successfully integrated, and what the barriers are that continue to challenge these efforts.

## Types of Public Values

The topic of public values has been one of the most salient and widely discussed topics in public administration and policy, especially since the turn of the twenty-first century (Jørgensen and Bozeman 2007). One reason for the growth of this rich stream of literature is that there are many different categories and spheres of public institutions where public values can emerge and be integrated. These range from relationships between administrators and the environment and other stakeholders to intraorganizational actions and the transformation of public interests into decisions (Jørgensen and Bozeman 2007). The main challenges for integrating values focus on three main spheres: politics and administration, public and private, and national and international (Jørgensen 1999). In public administration literature, each sphere has a particular constellation of

values that result from the types of institutions, actors, and relationships that pertain to those spheres. Jørgensen and Bozeman (2007) have proposed that there may be as many as eight types of these values, which they call "nodal" values. These nodal values are *human dignity*, *sustainability*, *citizen involvement*, *openness*, *secrecy*, *compromise*, *integrity*, and *robustness*. Public values are thus specifically *process-oriented* values of governance (De Graaf et al. 2016).

A common dividing line in types of public values is between *normative* and *economic* dimensions (Bozeman and Moulton 2011). Public organizations can be defined by economic publicness, which relate to the public role derived from political and economic origins of authority. In the economic sense, the integration of public values in public organizations follows primarily from their statutory function and is therefore more likely to be defined "from above" through systems of vertical accountability. Normative publicness, on the other hand, which refers to the level or quality of public values in an organization, is an explicitly value-oriented approach to defining publicness. According to normative publicness, organizations such as private companies, associations, and civil society organizations that are outside of the traditional definition of public authority may also have responsibility for integrating and upholding public values. Integrating public values in this way may involve hybrid forms of governance where nongovernmental partners are tasked with collaborating or cooperating with public agencies in the delivery of a service or the task of forming a new policy. Both network and market mechanisms for creating and integrating public values may be integral to these types of governance. Both network mechanisms and market mechanisms can plausibly be used to safeguard public values. According to De Bruijn and Dicke (2006), in order to be effective, both these mechanisms should be integrated with traditional, hierarchical approaches to promoting public values such as regulation, fines, and incentives.

Another, similar type of distinction among values in the public sector concerns *mission* and *non-mission* public values. The former concerns values that are connected directly with the fulfilment of public agency core goals in a specific policy area such as the environment, health, or defense. While the latter are other values that do not meet the criteria of strict relevance to core goals but still serve objectives that are important in the public interest such as organizational process values like transparency and integrity. Where the line is drawn between mission and non-mission values and whether the two can easily be integrated into agency goals remains an area of debate. However, some scholars have argued that the focus of new public management (NPM) reforms in the 1990s may have drawn policy-makers more deeply to the goal of measuring organizational performance, which favors mission values, which are more output focused compared to non-mission values. This may have led scholars away from study of broader organizational process or integrity values towards orthodox values of efficiency and accountability (Baehler et al. 2014). A further distinction can be made in the realm of non-mission values between regime values and mission-extrinsic values. While regime values are tied to historic development of government and community, mission-extrinsic public values are more specific and transitory depending on administrative priorities of a given political and technological setting. The latter refers to values such as transparency, public participation, social capital, and efficiency (Baehler et al. 2014). But like regime values, mission extrinsic public values are normally enshrined in constitutions and laws and can be realized by public administrations through public programs and policies (Baehler et al. 2014).

## Value Conflicts and Tensions

Integration of public values through public policy decision-making is complex and by no means a rigorous science. This complexity occurs because political and administrative pressures are a constant challenge. The new governance models discussed above may introduce a kind of "in-betweenness" status that makes integration of

public values especially difficult (Jørgensen 1999). But such decision-making arenas are the main way that public values become integrated in the work of government. Or, as one writer David Easton (1965) put it several decades ago, "public policies are the means through which politics allocate values." Given the importance of values for public policy-making, difficult choices must frequently be made between values as many of them conflict or trade-off with one another and they cannot necessarily be integrated simultaneously. For example, the demand for openness may conflict with the need for secrecy. Or the goal of robustness may require citizen involvement to be curtailed. Public administrators inevitably experience these conflicts of values and must try to resolve them. According to De Graaf et al. (2016), precisely how public values are integrated depends on the type of value profile of a public sector job such as being a middle manager, a front-line administrator, or a local government manager.

Public values compete through their placement in different approaches to policy decision-making, called *policy frames* (Davis and West 2009). An interest in rebalancing different policy frames regarding bureaucratic reform and fundamental public sector values emerged in the twenty-first century. According to Davis and West (2009), differences between these two frames lead to a major fault line in the tension resulting from integration of different types of public values: values emerging from a public deliberative process (*generative*) and values based on institutional processes and products (*institutional*). A contradiction between the two approaches arises when deliberative processes are integrated with public value management because there is disagreement on what should be considered a citizen-centric goal and who should define them. The major challenge for policy decision-makers in a democracy is in matching the pluralistic public values and frames with specific policy outputs.

Another area of scholarly thought has given attention to exactly how these conflicts and tensions can be successfully integrated. Reconciliation and integration of public value tensions is important because choices of values in the public sector have long-term effects on its heath and performance. Policy feedback theory says that policy implementation affects administration as well as vice-versa so there are long-term effects that policies might have on the values of future administrations (Moynihan and Soss 2014). Moulton (2009) divided these long-term effects into three kinds, each of which should be evaluated and integrated comprehensively by public administrators in order to realize public values: *regulative*, *associative*, and *cultural-cognitive*. Regulative outcomes concern how effectively compliance to rules and regulations is upheld. Associative outcomes concern the impact on the organizational and civic associations of society. And, finally, cultural-cognitive outcomes concern impacts on individual and social attitudes and behaviors. Stewart (2006) argued that public administrators can employ six different coping strategies when value conflicts occur: (1) firewalls, (2) bias, (3) casuistry, (4) cycling, (5) hybridization, and (6) incrementalism. Firewalls involve creating institutional barriers to keep conflicting value arenas separate. Bias involves prioritizing one type of value over another. Casuistry involves using prior experience to try to reconcile values. Cycling involves alternating through the different values at different times. Hybridization occurs when an attempt is made to merge values. Finally, incrementalism is a slow-moving process of gradually favoring certain values over others.

Research on successful integration of public values has explored a wide range of remedial tools available to the administrators or policy makers. For example, values can be integrated through leadership and strategic management. Public managers can prioritize strategic management decisions involving integration of both market- and value-oriented goals (Bozeman and Moulton 2011). A strong form of ethical leadership called transformative leadership has been identified by some scholars as a model for encouraging public organizations to serve broader public purposes and values (Pandey et al. 2016). Successful integration may also rely not just on internal factors such as technical skills and leadership but also external factors involving the role of nongovernmental decision-makers such as civil

society and citizens. Tools such as public participation may be a way of integrating values in more reliable, fair, and effective way. Public participation helps to integrate public values into programs by building trust, knowledge, and resolving conflicts (Beierle and Konisky 2000). On the other hand, co-production of services with other types of stakeholders may sometimes reduce or dilute the role of public values if conflicting values are not resolved in an equitable way or if public resources are misused (Williams et al. 2016).

## Barriers to Value Integration

Resolving conflicting public values is a perennial task of public administration. While there are possible tools discussed above that can help resolution and integration, there are also factors that stand in the way and frustrate integration efforts. Bureaucratic inertia and disproportionate influence of sectors of society with better resources can lead to slow adoption of values or to the erosion of value (Jacobs 2014). One of the main barriers to value integration is an existential one: there are fundamental disagreements on what the core goals and purposes of government should be. Some scholars have argued that, since the rise of NPM, there has been a tendency to attribute valuable resources and creations to the private sector and to ignore the role of the public sector as a key creator and leader in public values (Rogers and Kingsley 2004). However, the impact of privatization and hybrid government on public values is not clear-cut. Indeed, the effect of such reforms may depend on the phase of a specific policy or program as well as the type of public value in question. For example, according to Reynaers (2014), information intense phases of a project shape the value of *accountability*, while phases involving dependence of external advisors or legal and financial complexity affect the value of *understanding*.

Public values are both fragile and dynamic because they are by no means permanent, self-evident, or universal. On the contrary, research supports the view that values are rather transient from time to time and are conditional on many changing social, political, and other, environmental, factors. Public values are highly changeable. They respond to political, social, and economic contexts (Charles et al. 2011). Three macrosocial factors determine the emergence and integration of public values: political integration, technological development, and economic ideology (Charles et al. 2011). Furthermore, the promotion of values in public administration is strongly shaped by social and political power. For this reason, values are dependent on the influence of various citizen constituents in society. The effect of social equity on performance is conditional on the level of political and social influence of the social groups in question (Kroll 2017). Today, the role of powerful forces in society has been given an increasingly important theoretical dimension in the form of globalization. Globalization presents major challenge for government in aligning public organizations with global value chains that are shaped by economic forces outside of national borders. Maintaining value in global production chains therefore requires great sophistication and coordination to overcome, manage, and integrate cultural, political, and geographic obstacles. The types of value chain capacity building involving private enterprises and global economic networks will continue to be a major challenge for value integration processes in the near and distant future (Abonyi and Van Slyke 2010).

## Conclusion

The topic of values in the public sector is a major focus of public administration and public policy. There are a wide range of important public values that have been identified and categorized in public administration scholarship. A primary categorization rests on the distinction between output-oriented values such as efficiency and process-oriented values such as citizen involvement and transparency. All such values are difficult to integrate because they can conflict in certain ways along political and administrative dimensions or at different stages of a public program or policy process. Furthermore, shifts in perspectives on the core goals and purposes of

government reflect shifts in the values that are prioritized and integrated. Tools used to address integration can be either internal tools, managerial tools, or external tools focused on citizens or other external stakeholders. Public administrators and policy-makers face challenges to integration in the form of differing viewpoints, the influence of powerful interest groups, and the increasingly global scope of the process of public value creation.

## The Connection Between Integrity and Corruption

Integrity and corruption have been deeply connected throughout history both as concepts

and ethical realities. The two concepts begin with deep-seated etymological affinities that play out in modern ethical and institutional practice. This chapter tracks the ethical, political, institutional, and psychological relationships between integrity and corruption. It will examine how intimately the two connect in the realities of practicing integrity and facing personal and institutional corruption. It will discuss how modern corruption-fighting programs integrate promoting high-integrity organizations with multiple approaches to prevent and fight institutional corruption.

Etymologically, integrity and corruption are deeply entwined. "Rumpere" roots corruption and articulates how all things break apart and decay. "Com" intensifies this with an active and violent dimension that unfolds as cognates of reave, rupture, loot/plunder, rob, or explode. "Tak," the root of integrity, connotes a completeness or wholeness which extends to strong rightness and usefulness. The positive resonance of integrity faces the endless corrosion of corruption in the linguistic and political practice histories of the concepts (Watkins 2000; Mallory and Adams 1997; Chambers 2003).

In modern usage, integrity anchors personal and institutional purpose and mission. Having personal integrity is a fundamental prerequisite for ethical action and for individuals in an institution to sustain a common purpose. Corruption arises when an individual chooses to act against the purpose and obligations of their entrusted office to achieve personal gain or personal collective purpose. The second aspect of collective purpose can involve strong "ethical" commitments to groups such as family, clan, religion, or party (Albrecht et al. 2011; Graycar and Prenzler 2013; Langseth et al. 1997).

## The Integrity Model

The modern integrity model for persons and institutions proposes how individuals and institutions can develop and sustain commitment and performance in light of standards of mission and personal identity. This model depends upon a mode of human agency that constitutes the ethical and psychological architecture of integrity. This model of human self and personality enables individuals to intentionally make commitments and promises and keep them in face of challenges. It retains a deep connection to notions of classical virtue (Sherman 1989; Aristotle 1999; Macaulay and Lawton 2006; Cooper 1975).

The ability of persons to keep promises and live up to the obligations of entrusted power gives reality to integrity. Regardless of the nature of commitments, individuals need the foundational capacity to exercise self-aware discipline to intentionally make promises and cognitively guide action by them. Persons need to call upon courage, conscientiousness, and tenacity to implement them in face of obstacles. Individuals commit to honor the laws, policy, obligations, authority, and accountability relations of an organization and position. This ethical capacity is the linchpin of reliable performance and accountability and earning institutional legitimacy. (Visser 2014; Killinger 2010; Kooistra 2014; Huberts 2014).

This capacity to live up to a promise and commitment requires an integration of mind and intent with emotional support, perception, and willed action. Modern cognitive psychology reinforces the notion that individuals can develop such commitments and change their commitments and frames of action in light of experience, leadership, and culture. Humans can practice and train themselves to a high level of professional or institutional integrity (Cialdini 2009; Solomon 2007; Damasio 2012; Baumeister 1991; Korsgaard 2009; Klein 1998; Schon 1984).

The integrity model assumes that individuals possess self-awareness to align personal and institutional commitments. This self-awareness permits persons to discipline their mind, emotions, and body so they can adopt standards of judgment linked to their entrusted position. It means individuals are capable of striving to act impartially and with a level of unbiased fairness. This self-awareness can be deployed to offset the limitations of cognitive heuristics that can short-cut judgments. People are capable ethically to set will and reflection above self-interest and limited information. It entails cognitive and emotional discipline to seek out diverse good information

and focus upon being open and neutral in assessing decisions. This ability to minimize biases is fundamental to live up to institutional commitments (Dobel 1999; Carter 1996; Korsgaard 2009; Kouzes and Posner 2006; Killinger 2010; Kahneman 2011). The personal integrity model supports human capacities fundamental to high-performance integrity institutions and fighting corruption.

All institutional integrity strategies and corruption-fighting approaches depend upon the ability of individuals to exercise ethical integrity as persons in cooperative groups (Graycar and Prenzler 2013; Huberts and Hoekstra 2014; Huberts 2014; Lipshaw 2009a; Dobel 1999; OECD 1998, 2009; Burke et al. 2011; Rohr 1988). At the same time, people face the social and psychological reality that context and situation can overwhelm individual understandings and perception. Situations can distort ethical understandings and need to be the target of direct and consistent managerial and leadership action (Ashford and Anand 2003; Ross and Nisbett 2011; Burke et al. 2011; Graycar and Prenzler 2013; OECD 2009; O'Connor 2009; Janis 1982; Lipshaw 2009b).

The need to address context and culture puts a high premium upon leaders in organizations. Leaders and managers need to pursue strong integrity policy across time to model, build culture, create processes, and develop developing institutional controls through administrative channels, command, and control and by working to build social/cultural channels (Lang 2008; Dutton et al. 2010; Lipshaw 2009b). Organizational control requires a holistic approach that integrates organizational and administrative policy along with strong efforts to shape the organizational culture. Proximate and distributed leaders at all levels need to work to promulgate, model, and enforce the integrity values and be alert to corrupt practice or subcultures (Schwartz 2011; OECD 2009; EDI 1999; Huberts and Hoekstra 2014).

Any system's approach to integrity begins with a mission orientation toward integrity. Mission embodies the ethical purpose and direction for people. Corruption fighting should be the corollary, not the only focus, of commitments to mission for high-quality performance and treatment of colleagues and citizens. This ethical and psychological capacity merges into organization culture, shared frames of judgment, and accountability. Organizations – public, nonprofit, and for profit – require more than individuals. They need scaffolds of process, authority, relationships, and accountability to sustain legal and ethical outcomes. This leads to the modern approach to integrity-based organizations and fighting corruption as requiring a holistic and relentless political leadership and managerial approach.

## The Corruption-Fighting Model

The modern approach to political corruption aims to forge ethical institutions capable of mission-driven high-integrity performance. The persons in the institutions should share the commitment to mission and competence. The institutions should have the internal resilience or external scrutiny to engage corruption temptations when they arise.

This goal informs the contemporary international consensus that building integrity and fighting corruption requires a holistic political and institutional approach. The United Nations, the Organization for Economic Cooperation and Development (OECD), the international professional organizations, and the relentless efforts of Transparency International and its allies have generated an evolving international consensus. Corruption is defined as:

- The abuse of entrusted power for private gain.
- The abuse of entrusted power for personal moral purpose or collective gain.

It has extremely high costs to the welfare of citizens and reinforces inequality, exclusion, and unaccountable power.

The first definition tracks the work of Transparency International and the most commonly understood meanings of corruption. The second addresses more dangerous options where abuse of power flows from ethical justifications linked to "higher" moral commitments such as group,

religious, political, or ideological loyalties. These justify a person to ignore law and organizational standards to pursue personal moral ends (Transparency International 2011; Graycar and Prenzler 2013; Uslaner 2008).

Both approaches violate the legitimacy and purpose of public institutions. Both turn public institutions to purposes beyond those sanctioned by law or accountability. Both remain resolutely surreptitious and hide their long-term impact. The long-term results can be loss of revenue or legitimacy, increased cost, the displacement of merit, and inclusiveness or the creation of institutions used by one group to dominate other groups.

The standard range of illegal corrupt practices cover bribery, embezzlement, theft of public property, use of property for private purposes, misappropriation of funds, destruction of property and records, lying, and misreporting; these can expand to extortion and more felonious activities. These actions violate the obligations of office but a wider range of actions appear to be unethical or illegal and undermine the legitimacy of institutions. The corruption can be voluntary and collusive or induced by extortion or threat, and it can become systematic or episodic and opportunistic. Actions can be individual but can also expand and corrupt organizations, culture, or processes that pull in ranges of people. This expansion of corruption beyond individuals or opportunism to more systematic organizational or social corruption extends the social cost externally to those denied service, extorted of money, forced into behavior, and excluded from service (Graycar and Prenzler 2013; Transparency International 2000, 2011).

The international consensus on corruption has come haltingly and been most successful among professional associations seeking to define and implement standards ranging from accounting to assessment of risk to valid data involved in regulating commons areas (UN 2004). The OECD and later the European Union as well as international donors often link funding to accepting anti-corruption policies. This has given monetary impetus to the creation and adherence to public standards. In addition, international business has sporadically attempted to address issues of bribery and access as well as giving consistent support to more technical issues such as accounting and risk standards.

Public ethical standards can vary and must account for different cultural political values. This moves the focus to the integrity and autonomy of professional, efficient, and fair public service to all citizens. This has generated a range of principles that concentrate upon competence, accountability, fairness, and self-reporting. The OECD principles for managing ethics along with various United Nations proposals converge on the process standards that focus upon internal coherence, consistency, and accountability for public officials and preventing abuse of power and misusing funds (Transparency International 2000; UN 2004). These are:

- Ethical standards should be clear and public.
- Ethical standards should align with laws and legal framework.
- Ethical guidance and support should be available for public servants.
- Processes should be available to expose wrongdoing.
- Political will should support ethical standards.
- Decisions and processes should be transparent and open to scrutiny.
- Relations with the private sector should be regulated and transparent.
- Managers as well as policies in all areas such as procurement, regulation, and client service should promote ethical standards and accountability.
- Human resource systems should promote and protect ethics in public servants.
- Laws should be enforced and violations should be prosecuted and enforced.

This approach advocates that countries create an "ethics infrastructure." It accepts variation across cultures as long as the system supports consistency, accountability, and clarity in the standards. This approach can be expanded to how business should conduct itself and its relations with government (UNODC 2013). It places special emphasis upon transparent accountability at the leadership level and strong cultures of

integrity and compliance (Greenberg 2013; Burke et al. 2011).

The anti-corruption consensus pushes for policies to articulate, legalize, and enforce ethical standards. This alone is a huge improvement for many regimes and provides political resources to beleaguered government agencies as well as businesses facing corrupt officials. The approach has lead to a strong consensus in favor of standards of internal accountable and internal consistency in performance. The emphasis upon internal competence and consistency drives to the professionalization and autonomy of government agencies. It functions to push for external or internal processes that can search out corruption and enforce the standards.

Any serious attempts to develop integrity and fight corruption requires sustained political will, institutionalization, and a holistic approach. The OECD and Transparency International refer to integrity systems that are imbedded in each country. These systems ideally address everything from legislatures to human resource systems to enforcement patterns. Transparency International publishes periodic updates on the integrity systems of many countries as well as a yearly assessment of perceptions of corruption across the globe (Transparency International url). The holistic approach demands that leading, managing, and systems push down to the daily practice at the point of task performance with management and strong auditing and transparency programs (OECD 1998, 2009; Huberts and Hoekstra 2014; Visser 2014; Schwartz 2011; Kooistra 2014; Langseth et al. 1997).

These initiatives across countries and over time have created relative clarity and consistency about how to address integrity in institutions (OECD 2016). The ability to change organizations becomes more problematic when contexts are taken into consideration. The United Nations and OECD are painfully aware that many countries are permeated by systematic corruption either actively supported by or condoned by the government. Adam Graycar and others have mapped models of the system-wide nature of corruption and suggested how the consensus can be accommodated to account for the limitations imposed by the government collusion in corruption. The TASP model narrows in on the "type, activity, sector, and place" of the corrupt activity. This draws a more realistic picture of the actual range of corruption as well as the possibilities of action. It recognizes the need to map environments and build coalitions to tackle systematic or government corruption (UN 2004; OECD 1998, 2009; Graycar and Prenzler 2013).

Political will remains the single most important long-term determinant of success. Acknowledging context means that many anti-corruption campaigns have to be approached cautiously. Governments undertake anti-corruption campaigns for many reasons. Some do so to maintain flows of international capital or aid. Others embark on campaigns to shore up legitimacy facing public disenchantment or grass roots anger. Governments can address legitimate grievances, build up legitimacy, but also use anti-corruption as a means to eliminate opponents. These diverse and limited motives point to an underlying challenge all systematic corruption-fighting programs face – sustaining political will. This is doubly important since corrupt actors migrate underground and rise back when campaigns move on.

This approach requires a strong focus upon leading and integrity (Patzer and Voegtlin 2013; Lang 2008; Kotter 2012; Graycar and Prenzler 2013; Huberts 2014; OECD 1998, 2009). Only sustained action by authorized agencies and support for public officials will address long-term corruption. This action needs to be supported with adequate budgets, training, and autonomy for the anti-corruption agencies. Islands of integrity can be created and sustained, especially if the country gains benefits such as trade, capital inflow, or political support. These, however, remain very fragile unless ultimately supported by strong accountability measures and transparency that push governments to build human resources and enforcement structures to uphold them.

This has led to an emphasis upon creating autonomous anti-corruption agencies or building strong quasi-independent auditing and transparency-based agencies. While these can have some costs to the relative efficiency of

governments, they build standing agencies with the resources, albeit limited, and legitimacy to pursue corruption with relative autonomy from the political system. Some regimes have created institutions such as independent commissions that have both legislative and budgetary autonomy to escape the retribution from corruption privileged actors (Pope 1999; OECD 1998, 2009; Anechiarico and Jacobs 1996; Graycar and Prenzler 2013; Greenberg 2013; Guerber et al. 2011).

A range of viable techniques and tools are available to frame strategic approaches to corruption. The "audit triangle" focuses upon the strategic power of auditors to unveil corruption and predict where the most likely slippages will occur. It focuses on the dynamic interaction among perceived pressures, perceived opportunities and risk, and the range of available rationalizations. Similarly, ethics audits or vulnerability assessments enable organizations to identify critical leverage points to deploy leadership, management, technology, auditing, and various supports to address corruption (Lewis and Gilman 2005; Lang 2008; Albrecht et al. 2011). At the same time, technology and commitments to methods will never suffice. Enron had a widely recognized and honored risk assessment office; yet the office was routinely bypassed or used to rationalize illegal and unethical actions that lead to the corporation's demise. Corrupted leadership, corrupted culture, as well as conflicts of interest will subvert the strongest internal anti-corruption measures (McLean and Elkind 2013; Rapoport et al. 2009; Burke 2011).

Modern risk assessment has developed remarkable sophistication to anticipate dangers from corruption, information asymmetry, and accountability loss (OECD 1998, 2009; Huberts and Hoekstra 2014; Huberts 2014). Robert Klitgaard and others have refined principal-agent and economic theories into elaborate and effective maps of how to think about corruption. They can identify high-risk points and address issues involved in information asymmetry or mediate the point of contact between agencies and citizens where both opportunistic and systematic corruption results in subverted and unequal treatment of citizens (Klitgaard 1988; Graycar and Prenzler 2013; Rose-Ackerman 1999).

## Conclusion

Individuals of integrity can create organizations, build culture, adhere to standards, and achieve accountability. They are essential as leaders and managers to build high-integrity and high-performing organizations in all sectors of modern life. Internal and external forces, however, ranging from human greed to groups seeking to exploit governments for their moral purpose, constantly seek to undermine integrity in public organizations. This battle never ends. Only renewable political will and transparency forge the foundations to enable self and organizational scrutiny or reform to prevent and fight corruption.

# Integrity in the Public Service

Mary Ann Feldheim
University of Central Florida, Orlando, FL, USA

## Synonyms

Benevolence – Charity, generosity, empathy, kindness, sympathy, altruism, selflessness
Fairness – Equity, evenhandedness, fair-minded, impartiality, justice, neutralism, neutrality, objectiveness, objectivity
Honesty – Integrity, probity, truthfulness, veracity, verity
Integrity – Character, decency, goodness, honesty, morality, probity, rightness, uprightness, virtue, virtuousness

## Definition

Integrity: The firm adherence to a moral code by an individual based on relevant values and normative principles.
Public Service: The profession of public administration as described by the American Society for Public Administration (ASPA), the International City/County Management Association (ICMA), and the Network of Schools of Public Policy, Affairs, and Administration (NASPAA). This definition excludes elected officials and political appointees.
Normative Principles: The norms of a profession established through professional organizations and professional education that are intended to guide the thoughts and actions of individuals.
Ethical Values: Philosophers over the centuries have agreed on basic universal ethical values for relationships. These values are honesty, fairness or justice, and benevolence. These values are the foundation for creating trust in relationships, and trust develops over time when people are treated consistently fairly and honestly.
Honesty: To act in truthful way and to honor promises.
Fairness or Justice: To act in a way that is free from self-interest, bias, prejudice, or favoritism or injustice.
Benevolence: To strive to act in a manner that promotes good and avoids harm to individuals or groups of individuals.
Code of Ethics: Developed by a profession to provide specific rules of conduct for the behavior of its members reflecting the obligations and responsibilities of the profession to the public. The goal of a code of ethics is to establish trust in the profession based on the consistent behavior of the members.

## Introduction

In the simplest of terms, integrity is defined as the firm adherence to a moral code by an individual based on relevant ethical values and normative

principles. It is important to note that the moral code is specified by the individual, not the definition. In public service and administration that moral code has evolved over time responding to the changing expectations of society and the profession.

The current moral code has been categorized in several ways in the literature and by professional organizations. Professional organizations create codes of ethics to describe the ethical values and norms that members of that profession are to demonstrate when practicing their profession. The primary goal of a professional code of ethics is the creation of a morally high standard of behavior that instills trust in those served by that profession. The International City/County Management Association members adopted their first code of ethics in 1924 with the latest revision being in June of 2015. The American Society for Public Administration adopted their code of ethics in 1984 with the latest revision being in 2013. These codes reflect the norms or normative principles of the time, and they have evolved to address a changing society. The accrediting body for professional education programs in public service and administration is NASPAA, currently known as the Network of Schools of Public Policy, Affairs, and Administration (NASPAA). This organization was formed in 1970, and its mission is to ensure excellence in education and training for public service and to promote the ideal of public service. The universal standards for education in public service were adopted by NASPAA members in 2009 and amended in 2014 also reflect the current norms of the profession.

The public service literature and the professional organizations have identified multiple norms or normative principles that are being applied in the sector along with basic ethical values. The literature can be grouped into normative principles and ethical values. This distinction is critical since professionals, researchers, and governments use the terms interchangeably with variable meanings.

The normative principles or norms of the profession are presented first, because they have evolved over time and are listed in the order in which they achieved widespread acceptance. For American public administration the categories of normative principles are:

- Achieving professional competence and expertise
- Abiding by the rule of law
- Advancing democratic participation
- Advancing the public interest

For the first half of the twentieth century the importance of the ethical values in public administration was foreshadowed by the need to develop competence and expertise through scientific management. These ethical values were implied by the "public service ethic"; however, they were not clearly stated by the profession. Some have defined these values as virtue ethics or character-based ethics, where a person's actions consistently follow their stated values. For public administration the consistently stated values are:

- Adhering to the ethical value of honesty
- Adhering to the ethical value of fairness
- Adhering to the ethical value of benevolence

In the following sections, the normative principles and the ethical values of public administration will be discussed referencing the societal changes happening in the United States as the norms and values evolved. The discussion ends with the current thinking regarding the ethical values and norms that can shape the integrity of public service and administrators in any country. The basic components of an international professional code of ethics for public service will be presented to guide the profession into our increasingly interconnected world.

## Normative Principles

In America, different periods of time offered unique challenges and required the profession of public administration to respond in ways that addressed the challenges of the time. These responses resulted in the creation of professional

norms or normative principles, which are presented in the order they emerged. The most important point of this discussion is that these principles remain embodied in the norms of the profession.

### Achieving Professional Competence and Expertise

In the United States, public administration began with Woodrow Wilson's traditional model, which advocated for the separation of politics and administration. The goal of the model was to create a profession based on the science of administration resulting in the efficient delivery of public goods and services. Through education and training the primary traditional norms of professionalism – administrative and technical expertise and efficiency – were to be achieved. These normative principles continue to remain the hallmarks of the profession of public administration and are the basis for professional education and our research, as seen in the professional codes of ethics and in professional training.

In 1924, the membership of the International City/County Management Association (ICMA) adopted the first Code of Ethics that addressed the role of a public administrator focusing on achieving professional competence. The ICMA Code of Ethics was most recently revised in 2015 and speaks to the responsibility of the professional to continually improve their technical and administrative skills and to demonstrate this through their credentialing. The American Society for Public Administration's (ASPA) Code of Ethics challenges members to improve their capability, to act competently and to encourage the development of others in the field.

The accrediting body for professional education programs in public administration is the Network of Schools of Public Policy, Affairs, and Administration (NASPAA). The universal competencies identified by NASPAA stress that educational programs must ensure that graduates are professionally competent. This requires that accredited programs provide the knowledge and skills needed to be a competent, efficient, and objective administrator.

### Abiding by the Rule of Law

The traditional model of public administration focused on adhering to the law as a way of changing the culture of government and combating corruption. This was accomplished by establishing ethics rules in the form of regulations, statutes, and codes of conduct. These regulations and statutes created a bureaucracy that was designed to be efficient and to deter fraud and abuse through multiple checks and balances. Loyalty to the constitution and to the country was a key attribute of abiding by the rule of law to maintain order and peace. The interpretation of this has expanded over time.

The current ASPA Code of Ethics revised in 2013, asks public administrators to uphold the Constitution and the law, while seeking to improve laws and policies to promote the public good. The constitutional principles of equality, fairness, representativeness, responsiveness, and due process are the cornerstones that protect citizens' rights. The strength of a legitimate government resides in a Constitution that was created fairly and that provides for due process of all citizens. The ICMA Code of Ethics stresses that public administrators must have a deep sense of social responsibility as a trusted public servant. This stewardship duty to the people to administer the laws fairly and equitably to all citizens is key to the discussion of public trust, which can only be built and maintained when people feel they are being treated fairly. This expanded interpretation of the rule of law by the profession occurred during the last part of the twentieth century as the civil rights movement and the women's movement demonstrated the need for these constitutional principles to be a priority for public administrators. It was no longer acceptable to ignore inequality and unfairness in the application of the law or to ignore the voices of minorities or the disadvantaged. Educational programs in public service accredited by NASPAA are to provide both procedural and substantive education and define the boundaries of public service.

### Advancing Democratic Participation

The post–World War II era through the Watergate crisis was a very dynamic time of change in

American society. The period experienced explosive economic and population growth; suburbanization and urban crises; demands for civil rights and equal opportunity; marches in the streets and demonstrations on the campuses; political assassinations; energy crises and episodes of recession and inflation; and an unprecedented growth in federal, state, and local governments. This volatile and unstable public environment created a heightened awareness of the importance of politics and public service. The pressure for social change from minorities and women prompted the profession to examine the traditional model of public administration. The Minnowbrook Conference held in 1968 was the catalyst for a discussion of how public administration could move forward. New public administration emerged as the paradigm to frame public administration focusing on democratic citizenship, equity, social justice, and the public interest. The public administrator was no longer to be disengaged from the democratic process. The new paradigm required that the administrator actively encourage and provide opportunities for citizen participation in the democratic process.

The revised ASPA Code of Ethics identifies the principle of promoting democratic participation, by encouraging active public engagement in governance. To accomplish this administrators are to be transparent, open, responsive, and respectful when conducting business and in dealing with all people. Another principle in the ASPA code is to fully inform and advise all appropriate individuals of pertinent information providing accurate, honest, comprehensive, and timely information. The ICMA Code of Ethics focuses on keeping the community informed on local government affairs and encouraging communication between citizens and all local government officers emphasizing friendly and courteous service to the public. Both of these codes strive to achieve transparency with the elected officials and citizens to create a culture of trust. The NASPAA universal competencies stress that public servants emphasize the role of civil society in democratic governance. So that professional education programs make this an ongoing thread in their programs.

## Advancing the Public Interest

In the early twentieth century when the traditional model of public administration was developed the Progressive Movement aggressively addressed the social ills of the time, which were highly visible in our large cities. The public interest was found in the need for sanitation, for safety, and infrastructure; however, now the public interest is less visible and requires due diligence on the part of the public administrator to determine what is in the best interest of everyone in a community or within the country. Balancing the needs of multiple interest groups and the needs of the most vulnerable, such as our children, our elderly, and our poor, is challenging and requires strong interpersonal skills and data to support change that will advance the public good for the greatest number.

The ICMA Code of Ethics states that the chief function of local government is to serve the best interest of all citizens at all times. Inherent in this is the fact that a public administrator holds a public office, which is a public trust that should never be used for personal gain or benefit. This sentiment is echoed by the ASPA Code of Ethics except that the terminology changed from serving the public interest to advancing the public interest in the most recent version of the code. This is a significant change calling upon the administrator to be an active participant in the process of ensuring that the public interest is clearly identified. For NASPAA public service values require the administrator pursue the public interest with accountability and transparency.

Today the literature in public administration is increasingly focusing on the need for strong interpersonal skills in dealing with multiple stakeholders and interest groups. However, the concept of promoting governance through community involvement began with Mary Parker Follett in the early twentieth century. Follett advocated democratic citizenship through the creation of diverse groups of individuals (different classes, occupations, ethnicity, and backgrounds) coming together in creative encounters designed to address social problems. The goal of groups was to enhance citizenship and commitment to the democratic way of life addressing social problems

to improve the life of all citizens thereby advancing the public interest.

The focus on strong interpersonal interactions that Follett researched and advocated in the 1920s was soon overshadowed by the professional goals of efficiency and effectiveness. However, with the new public service movement and the emerging new public governance movement, the importance of advancing the public interest has become a priority, and this can only be done when every member of the public has their voice heard. Both the ASPA and ICMA Codes of ethics emphasize that public administrators should provide elected officials with complete information and recommendations for public policy decisions providing accurate, honest, comprehensive information and advice. The NASPAA universal competencies require that students of public service be able to interact productively with a changing and diverse citizenry and workforce responding to the demographic changes occurring in American society.

Not only does this refer to technical information, it refers to identifying the hopes and fears of the citizens who will be impacted by these policy decisions. To accomplish an accurate assessment of the public interest requires more than notice of a public meeting, it requires that public administrators go to where the citizens are meeting. Actively listening and providing opportunities for all to be heard goes far beyond providing information. Engaging citizens in a meaningful way can only be accomplished by administrators with strong interpersonal skills, trained in conflict resolution, with a willingness to listen and to hear the voices of the people. This then must be followed by acting on the public interest articulated by the citizens or making accommodations in policies and plans that are being proposed. This is the basis of citizen trust in government, when the voices of the people are heard and action is taken based on the feedback provided to government.

In the following section, the ethical values that the literature identifies as necessary in public service will be discussed. These values or virtues are honesty, fairness, and benevolence.

## Ethical Values

As previously indicated integrity means different things to different people, since it refers to an individual acting in ways that align with their personal beliefs and the prevailing social norms. For public administrators the social norms have evolved over time beginning with the traditional positivist model based on scientific management, which emphasized effectiveness, efficiency, and professionalism. This model has also been called the rational approach to motivation, where individuals are motivated by economic self-interest, and it is supported by agency theory, contract theory, public choice theory, and transactions cost theory. This model was modified in the 1990s by new public management, which promotes a private sector perspective utilizing contracting out as an option for the provision of public services.

More recently, new public service offers an alternative normative model for public administrators to emulate in their professional duties. Motivation for the normative model is rooted in the desire to serve the public interest, requiring the individual to act in a stewardship role as a trustee of the state's power. The second area of motivation for the normative model addresses the affective motives for public service, where individuals are embodied with a compassion for all people. Servant leadership aligns closely with this model of behavior. This normative model is based on basic universal ethical values for relationships that have existed for centuries, and they are honesty, fairness, and benevolence. These basic ethical principles are the foundation for creating trust, which develops over time when people are treated fairly and honestly.

### Honesty

For our purposes honesty is defined as telling the truth, and it is the basis for the creation of the trust. In the Judeo-Christian tradition the greatest obligation to the community is truthfulness, which becomes the foundation of a successful society. Honesty is necessary for commerce and for democratic governments to succeed. One method of

communicating honesty available to public administrators is through transparency. The ASPA Code of Ethics, the ICMA Code of Ethics, and the NASPAA Universal Competencies all advocate for the behaviors of transparency and accountability that demonstrate honesty. Clear communications and reporting before, during, and after executive decisions or policy implementation help to demonstrate that the individual is acting in an honest and authentic manner.

Authentic communication begins with each individual becoming self-aware of their assumptions regarding individuals and the world, because these assumptions have ethical implications and ultimately consequences. Once acknowledged by the individual these assumptions may need to be moderated to mitigate inherent bias that can influence their interactions and communications. The literature states that to be authentic a person must be fully present in the moment and respectful of those sharing that moment. This means that the individual becomes more aware of others, and the impact of their actions on others. Being authentic is being an effective communicator by listening and letting the cues of others guide the conversation relying on persuasion rather than coercion to communicate. As all societies become increasingly diverse, the need for cultural competency is critical for administrators interacting and communicating with the public. Authentic communication is the way to begin the necessary meaningful dialogue needed to understand each other.

### Fairness

The definition of fairness is the state or condition of being free from bias or from being unjust. In the profession's early years impartiality was used frequently as the principle for decision-making in the public sector. Over time the limitations of impartiality became apparent, when social injustices were perpetuated by being impartial to the societal conditions of all citizens. Under the current ASPA Code of Ethics, there is a new principle that addresses the profession's willingness to strengthen social equity, and this is echoed in the NASPAA competencies. The behaviors to achieve this are to treat all persons with fairness, justice, and equality respecting individual rights, freedoms, and differences striving to reduce unfairness, injustice, and inequality in society. This normative principle is based in the movements of new public administration and new public service, which focus on stewardship, honesty, social equity, and democratic participation in all aspects of administration.

### Benevolence

Previously benevolence was defined as striving to act in a manner that promotes good and avoids harm to individuals or groups of individuals. A strong leader creating an ethical organization models the key values of the profession and promotes the public good, while avoiding harm to individuals or groups of individuals. However, the very nature of public administration makes ethical leadership challenging. The most important impediment is that there are differing views of what constitutes the public interest or the public good, and strong ethical leaders must establish the values criteria for assessing the public interest for the organization and for individual projects and policies. This single act establishes the ethical climate of the organization. Other challenges are that frequently policies have vague criteria for implementation, and pressures may be applied by special interest groups and elected officials to make exceptions to existing policies and rules. The ASPA Code of Ethics advocates for the promotion of ethical organizations by striving to maintain the highest ethical standards, stewardship, and promoting the public good and avoiding harm to individuals or groups.

However, the difficulty with professional codes of ethics has been the lack of a mechanism for enforcement. In May of 2016, the ASPA ethics review process was launched as a way to address the ability of the profession to garner more oversight over the behavior of members of the profession. This process along with open and authentic communication and the creation of protected avenues of dissent can provide checks and balances to the actions of professionals. In the end though, courage and conviction in leadership are necessary to consistently serve in a manner that strives

to achieve the ethical values of honesty, fairness, and benevolence.

This discussion has focused on the basis of integrity in American public service; however, in a global environment, public servants need to establish acceptable ethical values for international interactions that are acceptable to all forms of government. Recommendations from the literature on those core ethical values are discussed below.

## Global Ethical Values or Virtues

The world has become interconnected in ways that cannot be untangled, and this requires a global standard of behavior for governments to work together. NASPAA has taken that leap and developed competencies that were created to promote a public service ethic that would translate to all governments. However, that public service ethic remains heavily influenced by American public service. Other writers have indicated the need to establish virtues or ethical values for successful governments. The new public governance movement focusing on collaboration is indicative of the evolving world of public service.

### Honesty and Fairness

In every religion and successful society, the top virtues are consistently identified as honesty and fairness in relationships. For public service, these virtues apply to both domestic and international affairs. The basis for trust in any relationship is that the actors tell the truth and act in ways that are perceived as fair by participants. For governments in domestic relations, a certain level of trust by citizens that they will be treated fairly and told the truth is necessary for stability. Public servants to be effective must consistently demonstrate honesty and fairness in their interactions. In international relations and international agreements where mutual benefit or fairness is designed to be part of the equation, honesty is key to establishing trust and stability. Market economies require stability to be successful, and the world has become a global marketplace that requires honesty and fairness in personal, business, and governmental relations.

In the fifth century B.C., Confucius stated that the main aim of good government is the happiness of the people. Centuries later the pragmatic approach to good government means that the majority of people are not unhappy with their government. Multiple ways of achieving this have been discussed in the context of codes of ethics for public service; however, the universally agreed upon approach is to listen to the people and to respond in ways that address their concerns to better the public interest. This has been characterized as responsiveness; however, at its basic level it is ensuring fairness in the treatment of all.

## Conclusion

This discussion of integrity in public service began with the definition of integrity as the firm adherence to a moral code by an individual based on relevant ethical values and normative principles. Clarification of this definition stressed that the moral code is specified by the individual, not the definition. The normative principles of public service and public administration in America have evolved over time responding to the changing expectations of society and the profession. However, the ethical values or virtues have remained the same, only they are now becoming more explicitly articulated and expected.

The normative principles were identified in the ASPA and ICMA Codes of Ethics, the NASPAA universal competencies, and in the public administration literature. These norms were identified as: achieving professional competence and expertise, abiding by the rule of law, advancing democratic participation, and advancing the public interest. The discussion of these norms centered on the societal changes and ethical writings in the field and their evolution over the last 150 years in America.

The virtues or ethical values in public service were for many years implied by the "public service ethic." For public service the consistently stated values are: honesty, fairness, and benevolence. In an increasingly interconnected world,

the need for universal global ethical values has become apparent to many in public service. The focus on ethical values for this larger perspective is because the norms that predominate in American public service apply in varying degrees to other governments.

The public service literature increasingly identifies honesty and fairness as the key components for international relations, and these values are seen as key to the creation of an international code of ethics. This is very significant for the integrity of professional international public service. Because when the moral code is standardized to mean honesty and fairness, the integrity of a public servant acting honestly and fairly has the potential to create stability and peace in both domestic and international relations.

# Integrity Management

Maryse Tremblay
Department of Political Science, Universität Leipzig, Leipzig, Germany

## Definition

**Integrity management** refers to "activities undertaken to stimulate and enforce integrity and prevent corruption and other integrity violations within a particular organization" (OECD 2009, p. 9). The **integrity management framework** is a specific set of instruments, processes, methods, and structures that are implemented and used to promote integrity within an organization. The integrity management framework can also be

referred to as a type of organizational ethics program.

**Acting with integrity** is to behave in a consistent manner in accordance with the relevant moral values, norms, and standards (including laws and rules) that are applicable in a specific context. Concretely, this implies behavior that is considered acceptable and desirable by an organization. It should be noted that the term *integrity* is used interchangeably with *ethics*, meaning that acting with integrity is a synonym of behaving ethically. And ethical behavior is not limited to individuals; it can be applied to a profession (such as doctors or accountants), an organization, or even a system. The specific values, norms, and rules used to judge ethical behavior will vary according to the actor(s) involved and the context.

Originating from conflicts of interests, **integrity violations** are actions that do not conform to an organization's established moral or ethical standards. They generally occur when two sets of values (e.g., personal and organizational values) conflict in the decision-making process, and an individual chooses to honor his/her own interests over those of the organization for which he/she is working.

The main categories of integrity violations found within an organization are (i) bribery; (ii) favoritism; (iii) fraud (including theft of resources); (iv) conflict of interests through gift; (v) conflict of interest through sideline activities; (vi) improper use of activities; (vii) misuse and manipulation of information; (viii) indecent treatment of colleagues, citizens, or customers; (ix) waste and abuse of organizational resources; and (x) misconduct in private time (Huberts 2014, p. 8).

## Introduction

Integrity management is one approach to addressing and managing organizational ethics, and it was officially adopted by the Organization for Economic Co-operation and Development (OECD) in 2009. Despite this approach being still relatively new, the two main components at its center (known as the compliance and integrity approaches) had already been extensively discussed in the literature in the 1930s, when Herman Finer and Carl J. Friedrich debated the influence of "external" versus "internal" controls on responsible conduct. In the past two decades, this duality has resurfaced (Maesschalck 2004) in the academic literature as well as in actual practice. This duality has thus become the core element of the most widely used approach in the field.

Integrity management is considered one of the most effective approaches for managing integrity in public administration. It allows organizations to curb corruption and fight integrity breaches through normative methods. More importantly, it focuses on both the importance of the decision-making process and the responsibility of the individual. In other words, integrity management seeks to achieve two main goals: (1) to foster integrity through the integrity approach and (2) to prevent unethical behavior through the compliance approach. Integrity management further highlights the importance of sticking a balance between the integrity and compliance approaches so as to achieve these goals.

This chapter sets out the basic foundations of integrity management and its framework. The first section focuses on the core of the framework: the compliance and integrity approaches. The second section of the chapter discusses the prescribed balance between the two approaches, while the third section highlights the recent criticism the integrity management framework has received.

## Managing Integrity

Individuals play multiple roles in society during their lifetimes, e.g., parent, friend, public servant, or citizen. These roles, which are directly linked to their function or status in society, are often played simultaneously but in different contexts. And with each role comes an inherent set of values which can vary greatly according to the person and the role being played. When these different sets of values are applied and respected in their respective contexts, there is integrity.

On a daily basis, depending on their lifestyles, individuals have to juggle a minimum of two sets

of values: personal values as well as organizational values. Thus, in certain situations, it can be challenging for an individual to show perfect integrity in his/her different roles. Indeed, the different values in each set can easily conflict with each other during the decision-making process, especially when the individual has not clearly identified the set of values that prevails in a particular context (e.g., at work). This is when ethical or integrity dilemmas arise.

In the case of a public servant whose functions are to serve the population and to act in the best interest of the greater good, it is particularly important to master these different, sometimes conflicting, sets of values and to understand that integrity will take on different forms according to the context within which he/she finds himself/herself. In an organizational context, organizational values – those of the public administration – should always prevail over personal interests and personal values. Sadly, this is not always the case, and integrity violations do occur. When undetected and unmanaged, integrity violations can lead to disastrous consequences for the public administration, such as the loss of public funds, rampant corruption, or the loss of public trust. This clearly demonstrates why organizational integrity needs to be properly addressed and managed. Integrity management is an approach that allows organizations to promote integrity and limits those unwelcome consequences through specific instruments, processes, and structures. The following section will elaborate on the specificities of this framework.

## The Integrity Management Framework

The integrity management framework combines two main approaches: the compliance and integrity approaches. Used in a complementary fashion, they tackle specific aspects of an organization's context and those of individual behavior. Organizations are free to choose the degree to which they wish to implement each approach, focusing more on compliance or on integrity. However, integrity management favors applying both approaches simultaneously in a precise balance in order to cover a larger diversity of individual behaviors and organizational factors. The specific balance an organization requires will thus determine the type of integrity management the organization applies, which will then dictate the methods, instruments, and processes to be used. Ultimately, the success of integrity management will depend "as much on the synergies between the instruments as on the effects of the individual instruments separately" (OECD 2009, p. 11).

Integrity management instruments fall into one of four categories: (i) determining and defining integrity, (ii) guiding toward integrity, (iii) monitoring integrity, and (iv) enforcing integrity. Concretely, these instruments derive their effectiveness through the processes and structures that support them. In the integrity management framework, there are three pillars. The instruments constitute the first pillar while the processes and structures are the second and third pillars (OECD 2009). The processes refer specifically to development processes which are linked to the management of the integrity management framework (such as planning, implementing, or evaluating), while the structures are the organizational aspects of integrity management (such as logistics and coordination). Each of the three pillars (instruments, processes, and structures) contains two subcategories: core and complementary instruments, processes, and structures (OECD 2009). Core instruments, for example, have the precise goal of inducing integrity, and they play a central role in the integrity management framework. The complementary instruments, for their part, do not have integrity as their main goal but are essential to the success of the framework as they support core instruments and address adjacent fields that can indirectly impact integrity.

## The Compliance Approach

The compliance approach is also known as the rule-based approach. As the name indicates, this approach provides a legal framework built on rules, norms, directives, laws, and other compliance measures to give the framework its teeth. The goal is to provide a normative structure within an organization to bring its members to comply with its rules and standards, thus avoiding integrity violations. Incentives and sanctions are key elements of the compliance approach which seek to

externally motivate individuals to comply. Indeed, this approach focuses on the use of external controls to regulate individual behavior(s). These external controls are imposed on the individual by an external authority, namely, the organization. External controls assume that individual judgment and professional standards are not sufficient to ensure proper ethical conduct and therefore provide strict guidelines for maintaining ethical behavior. Various instruments, processes, and structures make up the compliance approach, such as whistle-blowing policies, codes of conduct, conflict of interest policies, investigations, ombudsman offices, or complaint management systems.

### The Integrity Approach

The integrity approach is also known as the value-based approach. It is implemented through instruments, various processes, and structures, such as ethics training, mentoring, ethical leadership, workshops, codes of values, or ethical awareness. This approach emphasizes the importance of internal controls to stimulate an understanding and an application of certain values and ethical standards as well as to improve individual skills for ethical decision-making by providing the appropriate tools. As such, the integrity approach is about achieving individual self-control. This translates into undertaking an ethical decision-making process. Basically, internal controls are meant to promote integrity in the absence of explicit external rules.

The success of both approaches relies greatly on the synergy between the relevant instruments, including the coordination between them (at the structural level and content level), other stakeholders, as well as connected factors. Another interesting and important aspect is that integrity management pays a great deal of attention to the concept of fairness, which is, according to the OECD (2009), a crucial variable in the integrity of an organization's members. Indeed, a working environment that is perceived and considered "fair" by its members is more likely to positively influence their integrity as well as their tolerance level toward integrity violations, leading them to disclose what they perceive to be behavioral transgressions. Again, this underpins the idea that good behavior should be reinforced in any organization as a means to better circumscribe and manage integrity violations.

### Striking a Balance Between Approaches

In integrity management, the compliance and integrity approaches constitute two ends of a continuum. Each end represents an orientation that an organization can choose for its integrity management. The organization can choose either approach or implement a mixture of both, based on the organization's ethical needs and specific context.

In the field of organizational ethics and in actual practice, the consensus is that an efficient integrity management framework should include a mixture of both approaches, used in a complementary fashion. Indeed, integrity and compliance approaches should not be mutually exclusive but rather should coexist and be used in a balanced way. Concretely, this balance can be understood as a point somewhere along the continuum that expresses the relative importance as well as the form both approaches take on within the ethics program (OECD 2009). The importance and form given should depend on the historical, social, political, and administrative context of the organization at the time. It is the balance between these two approaches that shifts along the continuum and dictates the degree to which the various instruments and measures are used.

The need to strike a balance between the approaches is justified by the fact that "different approaches to ethics management will have different impacts on employee attitudes and behavior" and can therefore generate different outcomes (Treviño and Weaver 2003). As the compliance approach provides the "teeth" for the program, the integrity approach ensures self-control. When combined, the external controls deter integrity violations, while the internal controls promote integrity (OECD 2009).

However, striking an accurate balance between the two approaches, based on the organization's ethical needs and context, can sometimes prove arduous. Implementing the necessary instruments, processes, and methods can be costly and require

a lot of effort on the part of the organization. The challenge is to find a design where both approaches can achieve their goals within the given constraints on resources. Moreover, it is important to consider the congruence between the approaches. There has to be enough external control to deter any inclination toward individual interests but also enough internal control to allow ethical impulses to flourish. Finally, the two approaches must also reinforce each other by supporting ethical behavior and by avoiding conflicting messages.

### Recent Criticism of the Framework

As mentioned above, the integrity management framework is the most widely used approach in the field of organizational ethics. However, frequency does not guarantee the reliability nor the efficiency of the framework. Academics have recently started highlighting certain limitations with the integrity management framework, especially at the implementation level (Hoekstra 2015).

The most important step in the application of the integrity management framework is the assessment of the balance between approaches. This will dictate the proportion of instruments, processes, and structures that will be implemented for each approach. As such, finding the appropriate balance is crucial as it plays a large role in the overall success of the framework. One main criticism of this framework is that, despite this balance being essential, there is no method available to assess it precisely. In other words, this means that organizations have had to strike their own particular balance based on their own interpretation of the ethical needs and context of the organization. This also means that instruments, processes, and structures are implemented in specific proportions without knowing if they will have any impact on the organization's members nor if they will achieve the intended level of integrity.

Other academics, such as Tremblay et al. (2016), have further pushed their critique of the integrity management framework by highlighting weaknesses within its core: the compliance and integrity approaches. Firstly, according to Tremblay et al., the framework shows significant limitations insofar as:

1. Its main focus is on regulating individual behavior and promoting integrity, which leaves other crucial levels of organizational integrity, at the collective and strategic levels, unaddressed. When left unaddressed, these other levels can have a direct or indirect impact on the integrity of the organization and its members.
2. The framework emphasizes the implementation of external and internal controls, which are, according to the authors, neither one nor the other. Indeed, based on the theory of motivation (Deci and Ryan 1985), their nature (external or internal) depends entirely on the degree to which the control has been integrated by the individual. The more an external control is internalized, the more it becomes internal. Therefore, it is false to assume that a control is either external or internal and thus to base an entire approach around this dichotomy. This can also help explain why it is not yet possible to assess the balance between approaches: controls cannot be categorized and prescribed as solely internal or external. Controls imposed by an organization will always be external as they originate from an external authority, even if they are meant to be internal.
3. The two approaches at the core of the framework do not offer enough variety, in terms of instruments, processes, and methods, to cover the diversity of ethical problems organizations might face.

Notwithstanding these limitations, the integrity management framework remains the most widely used framework in public administrations around the world.

## Conclusion

This chapter has provided a detailed summary of integrity management and its framework. The first

section described the two main approaches at the core of the framework – the compliance and integrity approaches – while the second section explained how and why it is important to strike a balance between these approaches to achieve overall success. Finally, the third section highlighted some of the recent criticisms of the integrity management framework and pointed out specific limitations at the core of its design.

Intelligence services; Public intelligence policy; State intelligence function

## Introduction

This article addresses the intelligence function inherent of complex organizations from the perspective of the State. It explains its nature, role, and characteristics. In view of the existence of failures in its operation, it suggests a public policy approach, identifying the main factors to be considered in it, which are a pending task in Latin American countries. It focuses on one of the indicated factors, the institutionalization of the function and within this a specific aspect, the architecture of intelligence systems. It raises the challenge of adapting the structure of intelligence systems to the needs of the second decade of the twenty-first century, which requires the incorporation of new entities, as a result of new issues affecting the security of a country.

## Intelligence: State Function and Its Public Policy

The intelligence function can be understood as a capability inherent of complex organizations. It is primarily about anticipating to situations that may affect the existence of an organization. To achieve this, it is required to have information that allows detecting this danger, an entity in charge of

obtaining, processing, and disseminating it to decision-makers, and a capacity to periodically formulate reports that guide and alert when these dangers are identified, particularly when it is estimated that their occurrence may be closed in time.

For the State, having this ability to anticipate is a key issue (Herman 2001). From a military perspective, it can prevent invasions, but its usefulness does not end there. It also makes it possible to prevent situations where the lives of citizens may be affected, for example, in the event of a terrorist act, such as the placement of an explosive device in places with a high concentration of people or water contamination with hazardous chemical substances, among other modalities. Other benefits offered by this anticipation ability are related to facing conflict situations that may affect national interests, as is in the case of an international negotiation where a geographic delimitation or a peace agreement is established. Finally, it is also useful to support decision-making processes of the highest political authorities on strategic or critical issues. In this sense, it is an advisory role, since it ensures that decision-makers are well informed (Kent 1966).

For these reasons, countries have intelligence, which for a better understanding can be approached from three perspectives (Lowenthal 2006: 9): as a process, referring to the way in which different types of data and information are obtained, processed, analyzed, and translated into new knowledge within the framework of "intelligence production"; as a product, referring to the outcome of this process, that is to say, intelligence reports on different topics prepared with different periodicity to the highest authorities of the country; and as an organization, which corresponds to the entities from where the search and obtaining of data and information is planned, as likewise is managed its processing, analysis, and dissemination of information.

Intelligence agencies or services are distinguished from other public administration entities by the activities they perform. Indeed, they are organizations whose *raison d'être* is knowledge management (Esteban Navarro and Navarro Bonilla 2004). Among the main activities of intelligence services are (Johnson 2010) the search for and gathering of information, whether open, closed, or mixed, through a variety of available means and sources to which it can be accessed; the analysis of information, where the analyst faces the challenge of evaluating, assessing, and interpreting diverse information and preparing reports to be delivered to the intelligence consumer; counterintelligence, in charge of safeguarding its own information of others, for which it is protected, the information, the facilities where it is managed, the people who have access to it, and the communications through which it is transmitted; and the special intelligence operations, which are clandestine actions aimed at influencing in a certain sense specific situations deemed convenient to national interests. Not all countries carry out this last activity, and there is a debate on their relevance; however, many countries continue to carry them out.

From a political science insight, it can be stated that intelligence exists because conflict exists and the essence of intelligence is to reduce uncertainty in conflicts (Clark 2007: 8), by means of a deep understanding of the environment in which they manifest, the actors involved, and the interests at stake. It is specifically about the conflict that may affect the security of the country, that is to say, the life of its inhabitants, its territorial integrity, national sovereignty, and institutional stability.

In this sense, it is argued that having intelligence agencies or services would allow (Lowenthal 2006: 2–4) to avoid strategic surprise, for example, not to be subject of a sudden attack of other country in national territory; to provide long-term experience and knowledge in issues related to national interest, since intelligence agencies permanently monitor these matters, beyond the period of time of each government; to support the political process, in terms that the formulation of public policies requires information coming from different sources and on different aspects, matters in which intelligence can contribute in the matters it follows up; and to maintain the secrecy of information, needs, and methods, that is, to safeguard the confidentiality of the information obtained, the way in which it has been obtained, the matters that are analyzed, and the reports that are delivered on them.

The work of intelligence services may present what has been called intelligence failures (Gill and Phytian 2006; Jervis 2012). Indeed, when the security incident has occurred and, in the worst-case scenario, there are casualties, a generalized feeling of insecurity in public opinion and in the international perception of instability in a given country or in the face of a specific practice, which may even be transnational or international. There are several reasons for this, among them the politicization of services (Betts 2007) a recurring issue in Latin America (Swenson and Sancho 2015; Maldonado and Sancho 2016; García and Ugarte 2018) and problems in the analysis of information due to analysts' limitations (Heuer 1999).

Addressing intelligence in democratic political systems from a public policy insight can contribute to improve its quality, avoiding or reducing some of the classic reasons for its fails. Public policy is understood as the way in which the State intervenes to face a public problem and responds to it by means of a set of decisions in which different political actors located in the executive and legislative branches have participated in their formulation, review, and approval (Olavarría 2007).

In the case of Latin American countries, the formulation of a public policy on intelligence that contemplates at least the following factors, institutionalization of the function; professionalization of the activity; culture on the matter, both in the citizenship and in the specialized public opinion; accountability or responsibility in different levels and fields of State management; suitable and timely interagency coordination, and an effective international cooperation, remains a pending challenge (Sancho 2016).

Considering at least these elements is a necessary but not sufficient condition to have an intelligence able to respond to the requirements that faces within the framework of the Rule of Law – and to all the demands that this implies – when beginning the second decade of the twenty-first century and the time to come.

In practice, this translates into different topics which, when addressed, require a pronouncement from the responsible authorities: which are the matters which intelligence is deemed to deal with, since they constitute a danger to security and are not expected to affect the interests of the country or the life of its inhabitants; which is the most convenient intelligence architecture for the System Intelligence State (SIS) or intelligence community; how to progress in the professionalization of a function which requires increasing levels of specialization due to the complexity of the issues involved; how to reconcile secrecy and transparency at the moment of becoming accountable for actions and results; in which way we can facilitate the access to critical information and promote the exchange of information among entities that have a substantive contribution in intelligence?

The answer to these issues requires a transversal consensus among different political sectors, and the question is frequently asked when the debate begins: do the conditions, capacity, and will exist to achieve the changes deemed necessary to improve or strengthen intelligence? It is important to bear in mind that the quality of a democracy also depends on the way in which intelligence is carried out (Bruneau 2004). For this reason, it is relevant that it is carried out under criteria of legitimacy, legality, and effectiveness.

## Institutionalization of the State Intelligence Function and the Architecture of the State Intelligence System or Intelligence Community

The institutionalization of the State intelligence function constitutes an antidote for the main intelligence failures, caused by the politicization of the services and/or the errors in intelligence analysis attributed to a poor work of the analysts. Institutionalization can be understood as the process in which a desired practice by the community in which develops acquires value and stability.

In this sense, institutionalization is materialized by means of a regulation that establishes the reason for which intelligence agencies or services are created, the matters within their competence and the powers granted for the fulfillment of their objectives, the public entities that may carry out

this activity and the way they relate to each other, is a particularly relevant issue since these are public administration entities located in different public administration departments, which makes it difficult to exchange information and coordinate on issues of shared interest. A classic example of this can be seen in the case of terrorism, where different agencies may be monitoring the same group, for instance, the police for arms trafficking and also the armed forces for trafficking of mass destruction weapons and even customs for smuggling.

Thus, it can be seen that within the institutionalization framework, the intelligence architecture is relevant for the development of an effective intelligence capacity that can anticipate dangerous situations for the security of the country and its inhabitants, for example, in effect, architecture conditions, on the one hand, the quality of the information managed within the intelligence system and, on the other hand, the density of the intelligence coordination carried out within the framework of an intelligence system or community. Considering that it is beneficial for intelligence purposes to have the greatest amount and information available by related entities on shared topics, it is convenient to have a wide intelligence community, which integrates both counterpart entities of different public agencies and those entities which, due to the topics they deal with, are required to be included in the State intelligence system, even though it is still pending the development of its own intelligence capacity to systematize the information it accesses, which is considered critical for the country in the current security context.

## Modernization of the Intelligence Architecture. Modifying the Composition of State Intelligence System or Communities

Traditionally, in many Latin American countries, intelligence systems have been constituted by the armed forces, the police, and the civilian agency that coordinates and/or performs intelligence and connects directly with the highest political authority. Other countries have had a broader community, particularly in developed countries. At the beginning of the second decade of the twenty-first century, within a security scenario that has evolved incorporating new security issues, it is pertinent to consider the need of modernizing the intelligence architecture in these countries.

The change process in intelligence is not a simple matter because it requires a pluralistic and heterogeneous debate that provides relevant information for the decision-making process of the key actors. Furthermore, the debate must be open and transparent in terms of objectives, criteria, methodology, and results of the transformation process sought. Both issues are more difficult in intelligence, since a large part of its work is done in secret and specific topics cannot be revealed, except to those who are authorized to know about them, generating suspicions in the framework of a public debate where, as in the legislative branch, it is necessary to convince the representatives of the citizenship.

The adaptation, change, or transformation of an intelligence architecture that considers the current environment of security and its trends implies the incorporation of new entities in its configuration. Some criteria that can guide in its identification are as follows:

A) A first criterion to be contemplated is related to integrating different entities that in accordance with a broad definition of intelligence carry out this work. In fact, traditionally it has been considered the armed forces and the policies, since they would carry out all the inherent activities of the intelligence services. However, a broad definition of the term allows considering those entities that, by the very nature of their functions, access to closed source information on matters that affect the country security. In this sense, one can add, per example, the financial analysis or intelligence unit (in charge of preventing assets laundering and terrorism financing), the

gendarmerie (in charge of persons who are deprived of liberty), and customs (controls the entry and exit of goods across national borders).

B) A second criterion to consider refers, on the one side, to the context in which the interactions among persons, organizations, and countries take place. In fact, globalization illustrates this environment of growing flows of information and exchange of persons, goods, and services that with different intensity is carried out by all the countries of the world. A permanent monitoring of this, through national representatives in different parts of the planet, contributes to the identification of possible situations that may seriously affect the country in its security or national interest. For this reason, in these times, to consider the Ministry of Foreign Affairs in the Intelligence architecture is particularly necessary.

C) A third criterion implies considering new subjects to incorporate from one of the securities of people. In effect, while, on the one hand, the pandemic obliges to incorporate the notion of health intelligence, as well as to recognize that this information must be elaborated from an entity located in the Ministry of Health to be integrated in the intelligence system or community, on the other hand, there is a need to recognize that climate change, as well as the profound damage caused to the environment in specific areas, has sometimes irreversibly affected biodiversity and/or people's lives, through environmental pollution over time, which has proved to be detrimental to health and even lethal for some others. In this sense, it is necessary to consider the notion of environmental intelligence, develop it from an entity located in the Ministry that addresses the issue, and incorporate it into the intelligence architecture.

D) A fourth criterion is related to cyberspace (Crowther 2017). Recognized as a fifth domain or environment, it powerfully and even disruptively transforms social relations and interactions. Since it can be subject to attacks that affect its functioning temporarily or permanently, the main entity in charge of the security of this environment must, on the one hand, carry out intelligence in order to detect any damage to its functioning, which has been called cyber intelligence. In addition, this entity needs to be part of the intelligence architecture, since the matters under its responsibility match with an important part of the country's security, particularly with those related to management of the critical information infrastructure, thus being directly linked to the security of the country and its inhabitants.

## Conclusion

Among the functions of the contemporary State, intelligence is viewed as the capacity to anticipate to situations that may affect the security of the country. Essentially, it seeks to prevent situations that may affect people's lives, territorial integrity, national sovereignty, or constitutional stability. For these purposes, intelligence agencies are aimed avoiding strategic surprise, advising the highest authorities of the country on critical issues for their management or where national interests might be compromised. Among the functions of the contemporary State, intelligence is viewed as the capacity to anticipate to situations that may affect the security of the country.

Sometimes intelligence can fail, and there are several reasons for this, among which politicization and deficits in the quality of its analysts stand out. A public policy on intelligence can contribute to strengthen this capacity and reduce failures. In this regard, it is necessary to consider in the formulation of this policy, factors such as institutionalization of the function; professionalization of the activity; culture in the field, both in the citizenship and in the specialized public opinion; accountability or responsibility at different levels and areas of State management; adequate and timely interagency coordination; and effective international cooperation. This may contribute to

avoiding or minimizing the politicization of intelligence and a poor work of its analysts, especially through institutionalization. Likewise, considering the above factors promotes an intelligence based on criteria of legality, legitimacy and effectiveness, a relevant issue from a democratic perspective, since the quality of a democracy also depends on the way in which intelligence is developed.

Intelligence architecture in the second decade of the twenty-first century implies reviewing what already exists and not discarding modernization processes to adapt to the new security context. Thus, by considering criteria, such as intelligence in a broad sense; a security environment that requires to face integrally transnational organized crime; and the incorporation of new issues that affect people's lives such as pandemics, environmental pollution, and climate change, obliges to consider health intelligence and environmental intelligence as two capabilities that require to start developing from the public entities specialized in these issues; and the emergence of a new domain, cyberspace, forces to consider cybersecurity as an essential component of the security of the country and its inhabitants, being necessary to carry out cyber intelligence to prevent incidents that may affect the functioning of cyberspace, generating significant damage to the security or interests of the country, as well as to the life or welfare of its inhabitants.

# Intention to Vote by Academic Community

Lilian Gazzoli Zanotelli[1], Emerson Wagner Mainardes[2] and Rogério Dias Correia[2]
[1]Department of Psychology, Federal University of Espirito Santo, Vitória, Brazil
[2]FUCAPE Business School, Vitória, Brazil

## Synonyms

Academic voting intention; Behavior of the voter of the academic community; Perceptions of academic voters

## Definition

The intention to vote of the academic community refers to the intention to choose a candidate as educational manager by members of public educational institutions.

## Introduction

According to the literature, the intention to vote in a candidate is compared to the intention to buy a product or service by the consumer (Whelan et al. 2016). However, studies on this subject are still minor regarding the Brazilian public administration and the identification of voters' voting history in various electoral scenarios, as in public educational institutions (Whelan et al. 2016; Dassonneville et al. 2017).

Thus, this study proposes a model that relates perceptions (trust, expertise, attractiveness, image, and perceived quality) of the voters of the academic community with the intention of choosing a candidate as director in public educational institutions. To identify the antecedents of voting in an academic setting, we take into account its particularities (Hoegg and Lewis 2011; Dassonneville et al. 2017), which in this context are delimited by candidates for electoral positions represented by coworkers who have professional technical attributions. Such political perspectives of this voter from the academic community are not traditionally regarded and can generate competitive advantages in the studied scenario.

Investigating nontraditional consumers, as in an academic political context, helps to understand the factors that determine the preferences of these voters and how they behave when inserted in specific and nontraditional electoral contexts (Whelan et al. 2016; Dassonneville et al. 2017; Kirkland and Coppock 2017). Independent voters, that is, who have no ties with any political party tend to value more competency, excellence, and professional experience in the selection of their candidates (Kirkland and Coppock 2017). Thus, where the voter's choice of environment is not partisan, that is, it does not represent a traditional political scenario, as it is the case of the academic political context, the antecedents of voting may be related to factors distinct from the image of the candidates, being counterintuitive in what refers to the traditional Brazilian electoral policy.

## Consumption and Voting Behavior

According to the theory of consumer behavior, what leads a consumer to choose one product over another is the judgment of the factors that they consider important in the intention of purchasing a product. These factors are related to the preferences and perceptions that the consumer has against the desired product (Ohanian 1991; Barros et al. 2012; Whelan et al. 2016).

Just as consumers choose their products, based on their motivations during the purchase, voters choose their candidates according to their perceptions in a voting process (Newman 2002; Whelan et al. 2016). Within this context, the same assumptions that guide the purchase intention of a product also guide the intention to vote in a candidate, linking the model of consumer behavior with that of voter behavior (Ohanian 1991; Newman 2002; Whelan et al. 2016).

In both literature and practice, it is becoming increasingly common to refer to voters as consumers, using for this purpose, concepts and constructs that explain the preferences of the individual in the intention of consumption, whether of purchase or of vote (Newman 2002; Whelan et al. 2016). With this, in the study we seek to jointly relate validated constructs in consumer behavior to identify the perceptions of the voters in a nonpartisan electoral scenario, such as the academic environment (Ohanian 1991; Zeithaml 1988; Hoegg and Lewis 2011).

In the academic setting, unlike the traditional election, the candidate must meet technical and management requirements, without association with political parties, patronage, and favoritism of professional political candidates. The voter chooses their candidate in a similar way to how a consumer chooses a product, but the requirements of consumption in party elections are different in the political scenario of Brazilian

education, because in the latter the media is not present, not being inserted in this peculiar context, the academic public (Whelan et al. 2016; Dassonneville et al. 2017; Hoegg and Lewis 2011; Kirkland and Coppock 2017).

In a public academic setting, the candidacy of a political representative can only take place if they meet minimum technical competence requirements for management. In addition, the candidate must be one of the effective members of the academic community, taking participative action in it. Such requirements weaken practices anchored in political favoritism and clientelism in the appointment of political representatives to management positions, but not necessarily representing the aspirations and institutional needs (Myers 2008; Paro 2011, 2013; Whelan et al. 2016; Moraes and Teixeira 2017).

In Brazil, the local peculiarities of the electoral context influence the motivators for voting decision-making (Praino et al. 2014; Kirkland and Coppock 2017). The democratic management of education in Brazil, for example, emerged as an alternative to democratize public institutions, in order to value the quality of teaching and to leverage social protagonism and highlight professional competence (Myers 2008; Paro 2011, 2013; Moraes and Teixeira 2017).

This process of educational policy reform emerged based on the Brazilian Federal Constitution of 1988 and the National Guidelines Law and Bases of National Education (LDB), n° 9.394/96, the latter being referenced throughout Latin America. LDB guidelines aimed at promoting school autonomy and broadening the accountability of educational systems, decentralizing and democratizing school governance (Myers 2008; Paro 2011, 2013).

For example, one of the forms of democratic participation in public institutions in Brazil has been the election of school principals. In the elections, the academic community chooses and votes on the candidates: students, parents of students under the age of 18, teachers, and staff (Myers 2008; Paro 2011, 2013). The requirements to apply for the position are: having a degree, experience in public management, minimum of 3 years of academic experience, provision for training, and professional development and construction of a government plan with active community participation. A similar process occurs at universities and federal institutes in the election of rectors and directors of campuses, colleges, and departments.

In relation to valid votes, similar to the traditional context of the Brazilian elections, a second round is held between the top two candidates, with the winner taking possession at the end of the year following the elections (Myers 2008; Paro 2011, 2013). One of the main results of the democratic management of Brazilian education is that public education institutions have become more independent of partisan policies and practices of patronage and favoritism. Such practices are still quite common in Brazil's electoral scenario, mainly fomented by political party campaigns and indiscriminate influences of the media, but little present in the academic environment, which makes it a unique electoral environment, with potential to reveal knowledge not yet investigated in previous studies on electoral processes.

## Voting Intention

The process of choosing a candidate converges to the same premises of decision of purchase of a consumer, suggesting a comparison of a candidate to a product, and the voter to a consumer (Ohanian 1991; Whelan et al. 2016). For Newman (2002), the intention to vote, as well as the intention to purchase, refers to an anticipated future behavior of an individual. In an electoral context, this intention may refer to the choice of a candidate at a future date.

## Perceived Quality of the Candidate

For Zeithaml (1988), the perceived quality represents the result of the judgment on the excellence or superiority of a product or service, which is subordinate to the set of consumer values and not only to the objective quality or material of the product but its evaluation as a whole. Therefore, we suggest that in nonpartisan environments, as is the case of public educational institutions,

the quality of the candidates, that is, their excellence in the provision of services implies a possible influence on the electoral results (Kirkland and Coppock 2017).

## Trust in the Candidate

For the consumer, the perception of trust occurs through successive interactions with the product or service and its respective supplier. The consumer according to their experiences evaluates these interactions (Ohanian 1991). For the consumer, product history promotes a perception of trust, and similarly in the political sphere this trust is linked to the expectations voters have about the excellence of the personal, ideological, and professional qualities of their candidate (Akdeniz et al. 2013).

## Attractiveness of the Candidate

For Ohanian (1991), attractiveness relates to the physical attributes of a product or a representative, being perceived by the consumer as a visually pleasing and physically attractive product, as well as beautiful and elegant. In the democratic political scenario, we have found polls in which voters rate the most attractive candidates as having better quality for the professional exercise for the position (Praino et al. 2014; Nisbett and Dewalt 2016; Schnurr et al. 2017).

Voters tend to elect their candidates by physical attributes and appearance, that is, their attractiveness, judging that such representatives are more apt to assume a position of political management (Praino et al. 2014; Nisbett and Dewalt 2016; Schnurr et al. 2017). In Brazil, attractiveness appears as a relevant element for the selection of a political candidate, even in the academic world (Barros et al. 2012; Paro 2011, 2013).

## Candidate's Expertise

We believe that consumers who tend to recognize supplier expertise have more confidence in the consumption of their products or services (Ohanian 1991; Akdeniz et al. 2013). Similarly, it occurs in the electoral context, where the expertise of the candidates to occupy a management position can refer to the perception of the trust of its voters (Kirkland and Coppock 2017).

In addition, when consumers/voters have prior knowledge of a product or candidate, they tend to have the ability to assess and interpret attractiveness simply by familiarity, knowledge of their skills, and competencies to take on a specific role such as a management position (Praino et al. 2014; Stockemer and Praino 2017).

## Perceived Image of the Candidate

The image of a product can directly impact consumer trust, since a positive image reduces consumer perception of risk and consequently influences the increase of the consumer's trust for the purchase of a product (Aghekyan-Simonian et al. 2012). Therefore, the image of a product or brand becomes a relevant antecedent in the perception of trust in consumption, both in buying a product and a political candidate (Hoegg and Lewis 2011; Scammell 2015; Nisbett and Dewalt 2016).

In the electoral scenario, similarly as with consumers, such factors related to the candidate's image can increase their attractiveness in the view of the voter. This is because people often judge unknown individuals based solely on their appearance, inferring the image personality traits as charisma, for example (Hoegg and Lewis 2011; Olivola et al. 2014; Scammell 2015).

## Proposed Model

We suggest an analogy between the perceptions of voters and those of consumers, in order to verify the relations of the constructs that can directly or indirectly affect the voters' intention to vote in the academic community (Fig. 1).

The model proposes that the expertise and perceived image of the candidate should influence the trust and attractiveness of the candidate

**Intention to Vote by Academic Community, Fig. 1** Theoretical model and hypotheses. (Source: Own elaboration)

because both the expertise and a good image of the candidate can make it more attractive to their voter (Praino et al. 2014; Stockemer and Praino 2017; Olivola et al. 2014; Scammell 2015). In addition, the candidate who seems to have expertise and a good image to his or her voter tends to convey more trust to the latter (Aghekyan-Simonian et al. 2012; Nisbett and Dewalt 2016; Kirkland and Coppock 2017). Both trust and attractiveness tend to influence the perceived quality of the candidate by the voter, because it indicates that the more trustworthy and attractive the candidate, this will possibly represent quality for the eyes of his/her voter (Akdeniz et al. 2013; Praino et al. 2014; Nisbett and Dewalt 2016; Schnurr et al. 2017). This may be reflected in the voting intention of the academic community, because candidates who transmit quality characteristics will possibly be preferred by their voters at the time of voting choice (Zeithaml 1988; Kirkland and Coppock 2017).

## Final Considerations

The model suggests that the antecedents to voters' choice of vote tend to be similar to those of a consumer's intent to buy a product. However, when it comes to nontraditional political scenarios, as in the case of Brazilian public educational institutions, the electoral behavior of these voters differs from the traditional model with respect to the influence of the image of the candidates in the voting process. Thus, for such voters, values linked to the professional qualities that their candidates demonstrate to the desired position can be emphasized. The study provides a theoretical model based on electoral preferences in nonpartisan electoral contexts, which can be used as a tool to strengthen technical management skills of candidates for public office.

In addition, understanding the particularities of the context in which voters are inserted helps to understand how voters behave in voting choice and what are the reasons for their decision-making. Academic elections foster the untying and emancipation of political parties, because it focuses on the attributes and curriculum of the candidates to run for the elections, strengthening the trust of the candidate's work history, technical skills, and political management. With this, it tends to minimize media political campaigns and the performance of parties through patronage and personal favoritism.

Thus, the proposed model emphasizes that what leads the academic elector to choose a political candidate over others are nontraditional factors of an electoral scenario, represented by the professional excellence of a representative who lives the work dynamics of the institutional context in which they are inserted. This shows that the elector of the academic milieu is distinguished from the traditional voter, which reveals the importance of investigating this type of voter specifically, broadening knowledge in electoral marketing, since the academic voter is rarely investigated. In other words, applying consumer models or electoral marketing indiscriminately

to the academic elector requires adaptations that meet the specificity of this public. In addition, there is a need to develop own models to explain the behavior of academic voters.

# Inter-agency Coordination

A. H. M. Kamrul Ahsan
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Inter-agency cooperation; Managing interdependence

## Definition

Inter-agency coordination refers to synchronization of the activities assigned to agencies that are involved in pursuing a common goal. Since action of an agency leads another to act in joint project, inter-agency coordination can also be seen as managing interdependence of activities among agencies.

## Introduction

One of the most fundamental and oldest issues of administration is coordination. Coordination is considered sine quo non, while various units of an agency or different agencies are involved in getting things done together. In multiagency

settings where resources not limited to financial, informational, advisory, and technical are held in possession of and controlled by the different agencies, none of the agencies can work in isolation. Rather, there is a striving need to have cooperation among them aimed at achieving coordination of their activities. However, the obvious end of coordination is to have a harmonious relationship among relevant actors by synchronizing their actions in order for achieving goals for which they act together. The lack of coordination fails to avoid discord, friction, chaos, and confusion that ultimately lead to inefficiency and ineffectiveness in the activities of agencies involved. This in turn causes wastage of resources including time and energies.

## Meaning of Inter-agency Coordination

"Research and literature on inter-agency coordination is extensive" (Jennings 1994:53), and thus the meaning of it has been numerous. Simply, coordination refers to a way of either ensuring synchronization or creating coherence in and among the discrete functions of different agencies doing something together. To be specific, the need for coordination arises from dependency. If inter-dependency does not exist, there is no need for coordination. Thompson (as cited in Mintzberg 1979) identifies three types of interdependencies: pooled, sequential, and reciprocal. In the case of pooled interdependence, each otherwise independent entity contributes to the whole. Sequential interdependence occurs when the output of one's action is the input of another; in case of reciprocal interdependence, each stands in between the first two (i.e., the input and output of each action are sent and received by each other (Mintzberg 1979)). However, coordination is concerned with the management of interdependencies between activities to be performed for achieving a common goal. Existing literature on coordination figures out two generic components of coordination. One of them is horizontal coordination and another is vertical coordination.

While the former is known as inter-agency coordination, the latter ones are treated as intra-agency coordination. Inter-agency coordination takes place across the agencies that are considered to be independent from each other. To Seidman and Gilmour (1986: 224), inter-agency coordination is "both a process-the act of coordinating-and a goal: the bringing together of diverse elements into a harmonious relationship in support of common objective." Intra-agency coordination is ideally what is concerned with managing the activities of an agency. However, inter-agency coordination is more voluntary and personal mode oriented, whereas intra-agency coordination is more formal and based on hierarchical structure of the agency (Tsai 2002; Verhoest and Bouckaert 2005 cited in Christensen and Lægreid 2008). However, the focus of this paper is inter-agency coordination. Inter-agency coordination is required when various agencies act together for achieving a goal. So, the main thrust of inter-agency coordination is to determine who does what, when, and how in order to accomplish their respective tasks. In this regard, inter-agency coordination can be defined in terms of three types of linkage activities: information sharing, resource sharing, and joint action (Honadle and Cooper 1989). Information sharing essentially refers to interaction that takes place among interacting agencies. One agency lets another or others know what it is doing. Resource sharing means that resources that are in possession of and controlled by an agency are allocated to another. Joint action entails two or more entities, which undertake collaboratively some activity together, either sequentially, reciprocally, or simultaneously (Alter and Hage 1993).

## Mechanisms Used for Inter-agency Coordination

As noted earlier, inter-agency coordination is required, while various agencies get things actually accomplished together. This means that inter-agency coordination has been synonymous with managing interdependencies. However,

dependency among the agencies can easily be managed if they remain aware of these facts as to who will do what, when and how, who needs what, and whose action will lead whom (Brinkerhoff 1996). The degree to which agencies remain aware of who will do what, when, and how depends largely on the degree to which necessary resources – financial, technical, informational, and advisory – are shared among them on time (Honadle and Cooper 1989). Now the question that arises here is how resource sharing among agencies will be done. There are some mechanisms through which resources are shared. This in turn ensures coordination of their activities. However, the mechanisms that are used for ensuring inter-agency coordination can be grouped into whether they are formal or informal. Formal mechanism of inter-agency coordination may be of written laws, rules, and regulation, pre-established plans, standardized operating procedures, committee system, and standardized information and communication systems. On the other hand, informal mechanism that is used for ensuring inter-agency coordination may include personal communication, agency culture, and lateral relationships.

Approaches that are embedded into formal mechanism describe who will do what, when, and how. When function of agencies becomes specified, there exists no confusion among them. Rather, each remains informed of function assigned to them. Moreover, they also remain aware of the timeframe and procedure to be followed for accomplishing assigned function. Most unique features of formal mechanism are employees' adherence to agencies' practices and no disruption of their personal life. These have established formal mechanism as the most effective way of ensuring inter-agency coordination. However, despite having such uniqueness formal mechanism of inter-agency coordination is sometimes encountered with the problems that impede the process of ensuring coordination. Such problems are lack of willingness of persons concerned to follow procedure, lack of specification of the procedure used, lack of relevance of the procedure with the context to be studied, lack of existence of a strongly legalistic administrative culture, and lack of the favorable agency politics (Chisholm 1989; Peters 1998).

On the contrary, informal mechanism happens to be a way of either receiving resources from or passing on it to relevant agencies. Moreover, informal mechanism is synonymous with interaction that takes place suddenly upon the need to contract relevant actors. The main theme of interaction is communication that takes place informally bypassing the formal way of communication. Visibility of interaction remains absent, while it takes place through a set of norms, beliefs, and value system that are embedded into cultural compatibility to be found among the agencies. On the other hand, interaction among relevant actors clearly appears while it takes place through the approaches of informal communication. Among others, approaches of informal communication include personal contacts over telephone, face-to-face conversation, and direct request. A high level of mutual trust is required to exist among the agencies when informal mechanism is used for ensuring coordination among them. However, informal mechanism is also claimed to be an effective way of ensuring inter-agency coordination (Ahsan and Panday 2013; Chisholm 1989; Mintzberg 1979; Seidman and Gilmour 1986). The benefits of using informal mechanism over formal ones are free from agency politics, less time-consuming, flexible, spontaneous, facilitating, and innovativeness and novelty of issues to be dealt with (Chisholm 1989; Dalton 1959 as cited in Mintzberg 1979). However, informal mechanism of coordination is not out of problems. Such problems are lack of documentation of the approaches followed and the turnover of the members of agencies. However, these problems affect the process of ensuring inter-agency coordination severely.

Now the question that arises here is: Which one is best to follow? There is no straightforward answer to this question. However, what can be said is that formal mechanism of coordination works better in those countries, which have a strong legalistic administrative practice. Conversely, the high level of mutual trust is required

to work among the actors when informal mechanism is used for ensuring coordination among them. So, the use or application of a particular mechanism may not be effective for achieving coordination to all circumstances. As for example, a country may culturally be very rich but may not have strong legalistic practice or vice versa. Moreover, there is another view point, and according to it, the use of mechanism depends on several issues that include policies and context of the agencies, nature of the activities to be coordinated, and most importantly suitability of mechanisms with the preferences of the agencies. Since agencies are not homogenous entities, a particular mechanism that may work better for an agency may not be suitable for another. Thus, an effective strategy for achieving better coordination is to ensure simultaneous use of both the mechanisms.

## Nexus Between Formal and Informal Mechanisms

Agencies are built on both a specific period of time and a set of organizing principles. Organizing principles are not only a bundle of the written rules and regulations but also considered a glue that guides the agencies to achieve their goals. Moreover, agencies are required to follow the relevant rules and regulations that are embedded into their organizing principles while getting things done alone or with others. One of the most important functions of an agency is coordination that is subject to follow the relevant rules for its achievement. But, while using the rules as mechanisms, coordination may not always be effective due to the problems associated with the rules followed. That is why agencies are required to adopt strategies for avoiding those problems. Otherwise, overlapping, duplication, and even contradiction may appear in their operations, and any of these may lead to wastage of resources including time, energy, and most importantly financial resource that is always limited than necessity. Thus, it is said that although inter-agency coordination can easily be attained through formal procedure, it needs to be supplemented with informal procedure for taking care of the problems associated with formal procedure. Moreover, although reciprocal predictability of actors' action on the basis of formal procedure can easily be made in well advance of getting things done, their actions in any case of emergency that requires sudden cooperation from each other can neither be predicted nor be managed through the specification of formal mechanisms. Thus, formal procedures necessitate the use of informal mechanisms to take care of the problems associated with them. This is because informal procedures are not required to follow any formalized behavior; rather, it builds on informal relationship and is characterized with few unique qualities such as less time-consuming, flexible, spontaneous, and facilitating. By virtue of these qualities, informal procedures facilitate the process of ensuring coordination by compensating the problems of formal procedures.

## Conclusion

There are debates over the use of both the formal and informal mechanisms of coordination in the history of organization studies. Both mechanisms have specific benefits and costs. This means that agencies cannot overcome the problems that are associated with mechanism used unless and until a supplementary means is employed. To be specific, overcoming the problems associated with formal procedure necessitates informal procedure to use. In other words, failure of the formal mechanism breeds the necessity of employing informal mechanism, and informal procedure facilitates the formal mechanisms and compensates for its shortcoming. However, conclusion can be made by saying that a combination of both formal and informal mechanisms can ensure better inter-agency coordination.

# Intercultural Communication in the University: Policy and Practices

Yick Wah Leung and Baohua Yu
Department of English Language Education, The Education University of Hong Kong, Tai Po, Hong Kong

## Introduction

Due to the increasing globalization of higher education, there has been a dramatic increase in the number of nonlocal students enrolling at different Universities across the world, including Hong Kong. In recent decades, Mainland China has become the major source of international students in Hong Kong Universities. There has been a rapid growth of 233% increase in 2018/2019 compared to the number of non-local students in 2008/2009 (University Grants Committee 2019).

Advocate for the recruitment of non-local students believe that this can raise students' intercultural awareness as well as preparing them for the globalized economy. In addition, it is generally agreed that Mainland China and Hong Kong share the same Chinese cultural heritage which originate from Confucius's heritage and the similar character writing system (Xu 2013; Ma 2015).

However, the establishment of an intimate relationship between Hong Kong and Mainland China students is found to be difficult. This is due to different socio-cultural backgrounds and different University context that Mainland China students find uncomfortable (Ma 2015). Yet, there has been little systematic study to explore the initiatives that the host Universities can embrace to enhance the intercultural communication between Hong Kong local and Mainland students.

In this study, we sought to develop an understanding of what constitutes effective and ineffective policies for the enhancement of Mainland-Hong Kong students' communication. This was achieved by eliciting the perspectives of the university and students. Through semi-structured interviews and document analysis, we examined the students' views about the university support and arrangement. By placing the discussion in the specific context of Hong Kong, this study expects to enrich the overall understanding of the students' needs and University practice.

## Literature Review

### Intercultural Communication for Nonlocal Students

Intercultural communication is an important component for the successful adaptation of non-local students in the host University. It is suggested that

having sufficient intercultural communication could increase the level of sociocultural apprehension towards the local community (Williams and Johnson 2011). By having successful experience of intercultural communication, students would be more likely to attend the multicultural events or study abroad activities, which further develop their openness to other cultures. By contrast, nonlocal students with no intercultural communication with local peers would have poor sociocultural adaptation and feel socially isolated by the local community (Williams and Johnson 2011). Different from the psychological or academic adaptation, it is worth noting that the difficulty of sociocultural adaptation is that it does not improve over time. The student who feels socially isolated in the first year would avoid the intercultural contact and find it more difficult to make local friends (Marginson et al. 2010; Gareis et al. 2011).

Regarding the intercultural communication between students from Mainland China and local students worldwide, most researchers focused on the insufficient language proficiency. It serves as a communication barrier, which isolates nonlocal students from the host-community and make them struggle with the discussions or oral presentations in the classroom (Sawir 2005; Yu 2009). Consequently, this affects the nonlocal students' academic performance in the University (O'Reilly et al. 2010).

It is generally agreed that those students with higher host-language proficiency would have more confidence in communication. However, some researchers argued that they are not always correlated. For example, Jacob and Greggo (2001) found that nonlocal students often overemphasized their own mistakes and avoided to make mistakes by reducing intercultural communication. Previous studies also suggested that such language anxiety would restrict the development of intercultural understanding even when there is an opportunity for social interaction (Yates and Wahid 2013; Yu 2013).

While the language researchers highlighted the importance of host-language proficiency, the sociologists tend to focus on the incompatible cultural features. For example, Yeh and Inose (2003) study found that Asian international students may experience more difficulties when interacting and attempting to make friends in a Western culture that emphasizes individualism, assertiveness, and self- sufficiency over interdependence and relatedness. Chen (2005) compared the Asian and European students and reported that Chinese students are more likely to develop the co-national friendship with a common background. Chen (ibid.) explained this phenomenon using the collectivist culture, which emphasizes "*integrity, in-group membership, and high sociability*" (p. 38). These studies often adopted the Cultural-Distance Theory, which explained the adaptation difficulties of the Chinese student by the incompatible cultural difference.

In previous local studies, less attention has been paid to sociocultural difference between Mainland and local students. As mentioned before, this is because they share the same Chinese cultural heritage which originates from Confucius heritage and the same character writing system (Ma 2015). Instead, emphasis is placed on the relationship between the University policy and the student. It is reported that Mainland students is lack the opportunity to interact with locals as Hong Kong people are detached and lead very busy lives. In this case, Mainland students feel uncomfortable to approach the local people either for help or a friendly chat (Pan 2007). Even their friendship is initiated, the Mainland students would find it difficult to have meaningful contact with local peers, often due to the lack of common topics of conversation (Chiu 2014) and superficial conversation (Lu 1998; Chen 2016). The Mainland-HK friendship is even described as a "fleeting" relationship, which is difficult to maintain and develop (Yu and Zhang 2016).

## University Support of Intercultural Communication

To facilitate the intercultural communication between students, the Universities are expected to take a more active role in promoting more intercultural interaction. In the literature, the major university-centralized support could be categorized into two types: to equip students with satisfactory level of host-language proficiency;

and to offer the opportunity for intercultural interaction (Chiu 2014).

#### University-Led Activity

Arguably, host-language proficiency is the key communication competence for effective communication (Ward and Kennedy 1994; Yu and Watkins 2008). Therefore, many host-institutions have designed different language training courses for improving the communication skill of nonlocal students (Kudo and Simkin 2003; Allen et al. 2008). However, some critics argue that those courses may not be so effective as few of them involved the natural expression in the real context (Kudo and Simkin 2003; Allen et al. 2008). Also, Mainland students were lack the opportunity to use Cantonese in daily life due to the rare interaction with local peers (Chiu 2014).

To promote more opportunities for interaction, the Universities also try to organize different social activities such as off-campus cultural visits (Spencer-Oatey and Xiong 2006), joint research programs and field trips (Zeng 2006), and buddy programs (Chan 2010), yet their effectiveness remains doubtful (Chiu 2014).

#### Student-Led Activity: Social, Cultural, and Other Extra-curricular Activities

In the literature, many researchers considered extra-curricular activities as a means for nonlocal students to develop host-national relationships in the new cultural environment (Hendrickson 2018). They could gain social capital and resources directly from group members and through the connections these members have with other associations (Lin 2005). Students could also build their social networks and host national connections through club membership (Neri and Ville 2008; Mittelmeier and Kennedy 2016). Like individuals, each organization varies in terms of the types of connections and network resources they afford members (Lin 2005). Affiliation with these groups could offer additional connections and information regarding host national communication patterns.

On the other hand, the university will sponsor different types of student activities every year, such as the student union, sport teams, and Hostel Residents' Committee. Though their main purpose is not for building intercultural relationships, these activities are often reported as the main platform for intercultural interaction (Chan 2010; Harryba et al. 2013; Spencer-Oatey et al. 2014).

Although it is generally agreed that the University has played an important role in facilitating intercultural communication, there is no common consensus on whether the University should offer support directly or decentralize its responsibility to students.

#### Practical Activity: Daily Interaction in the Campus

Regarding the opportunity of interaction, a growing body of literature has focused on different intercultural interaction in daily life. Pioneered studies on international students found that housing international students with local students increases the opportunity for students to have contact with the host culture (Savicki 2010), and students tend to establish intercultural friendships in situations where efforts to initiate relationships are minimal (Kudo and Simkin 2003).

On the other hand, the classroom is considered as another setting that offers an opportunity for friendship development through consistent contact and group projects (Stearns et al. 2009; Ruan and Zhu 2015). It situates students in proximity with host nationals who share academic interests (Bennett et al. 2013) and facilitates interaction through team learning (Rienties and Tempelaar 2013).

### Debate About the Role of University in Intercultural Communication

The debate about the university-centralized support mainly centers on three major themes: whether it raises administrative efficiency, whether it addresses the specific needs of students, and whether it encourages the active participation of students and thus improve the quality of interaction.

Advocates for centralized-planning argue that this allows the university-manager to make decisions and coordinate the overall activities more easily. It also ensures a more systematic and substantial support to the nonlocal students (Gonzalez 2009; Nieri 2012). At the individual

level, it is argued that the centralized-planning support allows for better response to the specific students' needs. By contrast, advocates for student-directed planning could develop more relevant activities that are best suited to students' needs and interests. At the same time, the decentralized approach would guarantee more voluntary participation of students, which leads to more student's motivation (Preedy and Jones 2017).

Although considerable effort has been made to explore different possibility of the university support, rather less attention has been paid to whether and how the university and teachers may facilitate the intercultural communication and friendship development.

To sharpen the discussion focus, this study explores the staff and students' views on the current University support for Mainland students and what expectations they hold. The following research questions are proposed:

1. From the students' view, which university's initiatives are considered as the most effective (and least effective) with regards to the Mainland-HK friendship development?
2. How do the existing university's initiatives contribute to the development of Mainland-HK friendship?

## Research Method

### Research Design

To address the research questions, a multiple case-study design was adopted. It is often seen as prime examples of qualitative research which allows the researcher and the participant to illuminate or draw attention to different context and express the subjective meanings that people bring to their situation (De Vaus 2001).

### Sampling

The invitation letter was sent to all students (Year-2 or above). The study involved 24 University students (12 Mainland and 12 HK students) who were recruited from a medium-sized Hong Kong University. Using semi-structured interviews, the students were asked to share their experience of intercultural Mainland-HK friendship formation. The interviews were conducted in Cantonese or Putonghua, depending on the participants' native language.

On the other hand, the executive manager of Student Affairs Office (SAO) was invited to participate as the key informant in an interview. SAO is the main unit which provides the major support to all Mainland students, while the executive manager is responsible for the planning, coordination, and evaluation of all activities. It was assumed that the key informant interview could represent the university's view and give us first-hand knowledge about the university's position. The interviews were audio-recorded with the endorsement of participants.

All participants were required to fulfill the following criteria: (i) being enrolled on a Full-time Undergraduate or Postgraduate program; (ii) having been living in Hong Kong for more than 12 months; (iii) having arrived in Hong Kong less than 6 months before the program started (Mainland students only); (iv) having reported as having a satisfied level of intercultural communication with HK students (or "with Mainland students" for HK participants). It was assumed that students with study period over 12 months could have had enough peer-interaction and offer sufficient data for analysis, while the nonromantic friendship can ensure that the reported experience could have a less emotional bias.

### Data Analysis

After the data collection, constant comparison approach was used as the analysis strategy to organize the interview transcripts, where the data collection and analysis are not independent phases but a continuous cycle (Glaser 1967). The new data were continuously compared with the initial categories, and new categories created when the new data could not be embedded in any of the existing groups.

In practice, the constant comparison approach involved going through a three-level coding process (open, axial, and selective coding) from the most descriptive to the most interpretative level (Miles and Huberman 1994; Creswell 2009).

## Findings and Discussion

In this study, a considerable majority of students (n = 24, 82.8%) reported that the University has tried to facilitate the intercultural communication through different activities. In addition, 60% (n = 6) Hong Kong students and 42.9% (n = 6) Mainland students agreed that the University's initiative is effective in facilitating the communication between Mainland and Hong Kong students (Table 1).

**Intercultural Communication in the University: Policy and Practices, Table 1** Students' view about the effectiveness of university's initiative

| | Hong Kong students (N = 12) (%) | Mainland students (N = 12) (%) |
|---|---|---|
| The university has encouraged the intercultural communication | 83.3 | 75 |
| The university has not encouraged the intercultural communication | 16.7 | 25 |
| The university's attempt is effective | 58.3 | 41.6 |
| The university's attempt is not effective | 41.7 | 33.4 |
| Neutral | 0 | 25 |

Regarding the types of university initiatives, seven main categories emerged from the students' perspective. It was found that the student-led activities (Orientation Camp and Student's society) were reported as the most effective ones (49%), while 36% of the students selected the university-led activities, including Cantonese course, Buddy program, and cultural tours, and shared their experience in the interview (Fig. 1).

### Effective University-Initiative as Perceived by Students

#### Orientation-Camp, Student Society, and Other Extra-curricular Activities

In the interview, the extra-curricular activities were reported as the key to build the Mainland-HK friendship. In general, three kinds of activities were identified: (i) practical activities, (ii) physical and social activities, and (iii) cultural activities of common interest.

**Practical Activity During the Overseas Exchange Program** In the interview, many students considered the overseas exchange as the key event which promotes their friendship development. For example:

**Intercultural Communication in the University: Policy and Practices, Fig. 1** Effective university's initiative as perceived by students

> When I visit foreign countries together with my (Mainland) friends, I had a strong sense of "national identity" and felt that both of us are Chinese . . . it gave us a dynamic context to face an unfamiliar world together, which I had never experienced before (HK-01)
>
> We will perceive greater similarity in Australia. We speak Cantonese, face the same challenge, and solve everything together in a united group. Different from Hong Kong, we are not host or guest anymore. (ML-04)

The above finding is consistent with previous studies, which suggested that more frequent interaction would reduce intergroup anxiety or develop a more positive attitude towards other cultural groups (Masgoret and Ward 2006). More than that, it shows a quality shift from acquaintance to friends in the overseas exchange program. It is because the commonality would be particularly highlighted in such an unfamiliar environment. Also, Mainland and Hong Kong students must resolve the unknown challenge in academic and daily life together. Not only could it blur the original host-guest boundary but also converge different cultural values and identities through establishing another inclusive identity "Chinese" Their identity and the cultural difference would then recede into the background (Lee 2006).

**Sports and Social Activities (Common Goal)** The interview demonstrated that the students with close Mainland-HK friendship often involved in a variety of sports or social activities, such as Sport team, Student Hostel Committees, Student unions, or other different student societies. Several students stated that they made most of their local friends in extra-curricular activities outside the classroom, and met their best friends there (ML-03/ML-10/ML-08). A Mainland student elaborated on the role of extra-curricular activities as below:

> We got to know each other when we joined the dragon boat team. We trained together after school, and meet again in the classroom. We often sat and did most of the project together (ML-08)
>
> The most useful one is the Hall-Management Committee. I am a member of the "secret-sharing group," which is responsible for listening to the unhappy experience of others, no matter their quarrel with boyfriends, or their academic struggles. It helps us make good friends and increases our mutual understanding with each other. I become less hesitant to disclose myself as well. (ML-03)
>
> In the orientation-camp, you work together to achieve different tasks and live together for several days. It is easy for you to become familiar with each other (ML-04)
>
> I will suggest the upcoming student to join volunteer activities, the orientation camp or student society. They could help them to integrate into the local community and make many friends (ML-10)

This finding is consistent with the previous study which states that international students would moderate access to the informal culture of the local community and lead to better sociocultural adaptation through participation in recreation activities (Glass et al. 2014). Through the participation of different social activities, students interact with others who have a similar goal, where neither local students nor Mainland students have to make additional efforts to spend a considerable amount of time together and meet regularly. On the other hand, the team-duty encouraged a wider and deeper self-disclosure (ML-03/ML-04). Also, the student alluded to the solidarity that stems from sport-team and its extension to other social activities (ML-08).

Moreover, to achieve the common goal of the whole team, it is important to build up a team spirit and tacit knowledge between each other. Similar, to the overseas exchange, a relational identity, e.g., dragon-boat team member, would be established during the activity and blur the background identity between each other.

**Extra-curricular Activities (Common Interest)** In the past, numerous studies reported that common interest breeds connection and liking. Not only does it contribute to initial attraction, but also the development of close friendship bond (Parker and Seal 1996; McPherson et al. 2001; Ellis and Zarbatany 2007). It is also reflected in the interview:

> At first, she is a friend of my roommate. Once, I cooked something and posted it online. She gave me a "like," and we started chatting with each other. She loves cooking as well and invited me to cook together. I also invited her to come and cook her dinner (ML-09).

Moreover, it was particularly important for those not living in a hostel and have little to no contact with local students in the class (ML-09). The above student suggested that the cooking party and Christian's weekly gathering are the main connections with her local friend, because their study schedule are completely different from each other. Besides, it is worth noting that the selection of extra-curricular activities is sometimes regarded as a way to build up the personal image:

> The new students should join the student activities, which could show your strength. . . Once you could show your strength, other students will approach you directly. If you are the weakest one in the team, and everyone looks down to you, you still cannot make friends even if you join all sessions (ML-11)

The above finding is consistent with the previous literature, which state that the extra-curricular activities could facilitate the intercultural interaction and communication (Chen 2016; Glass et al. 2014). It is also regarded as an opportunity to build a more desirable identity by showing personal strength. It reflects that, in their view, selecting a more favorable context, rather than personal factor is more important to their friendship development.

### Matching Buddy: Ambassador Program and Mentorship

Apart from the extra-curricular activities, the University has launched the buddy program "I-ambassador," which is the second most frequent shared activity in the interview (10%). In the mentorship program, the senior local or Mainland students would be recruited as the student-mentors. They would be responsible for two parts: (i) Tea-gathering: Sharing their experience and precautions that the new students take while living in Hong Kong; (ii) Plan and lead some activities (such as cultural tours, hand-out workshops or Movie nights) to share own cultures.

In general, the buddy program is highly appreciated by the Mainland students as it could help them adapt to the campus life smoothly by being responsive to their individual needs:

> The most helpful one is the buddy programme. An experienced Mainland student is arranged to give us advice on everything. When I am not sure what I should prepare for a certain event, or what precaution I should take care of, she can give us useful advice (ML-03).

From the above, the mentor could provide more detailed advice to Mainland students on an individual basis, and help them better prepare for the unknown challenge. It is of particular importance for supporting the nonlocal students. It is because most nonlocal students do not know what they need or what precaution is required until they face some difficulties.

The advice from the senior Mainland students, however, may not always be accurate. For example:

> Many new Mainland students may ask mentors whether Hong Kong students discriminate against mainland students, or if it is difficult to integrate into local community. The mentor often says there will be discrimination. . . However, you still have to experience it yourself. Their experience could be a reference, but you should not completely believe others. Don't label Hong Kong students before meeting them (ML-08)

From the above, it seems that the sharing session may increase the risk of intercultural anxiety due to the subjective and biased-views of the senior student. To prevent the biased view, therefore, the University should coach the student-mentors first and help them to express their views in a neutral way.

### Language Support and Enhancement

In the interview, the SAO particularly emphasized the importance of Cantonese-learning course and suggested that it is the most welcomed activities among Mainland students:

> We have five "Survival Cantonese Workshops" this year, and they have been full already . . . We will teach the common Cantonese words and phrases in different contexts, such as transportation, ordering food, go shopping etc. Every course includes two sessions, where the student could freely sign-up (SAO)

It is consistent with the students' view, which agreed that the course is helpful for them to learn Cantonese through diversified themes. Moreover, this was considered as another platform for making friends:

> When we arrive, there is a Cantonese-speaking group. I could learn Cantonese from Hong Kong peers. It is very interesting, and my Cantonese proficiency has been improving significantly (ML-01)

> If you'd like to make more Mainland friendship, I suggest you join the learning activity of ASLLC (Arthur Samy Language Learning Centre). You can find the language learning series, or one-off workshops about English, Putonghua and other third languages there. Most students are from Mainland China, and you can make friends easily (HK-04)

Though only 6% students talked about the Cantonese-learning course, it does not mean that it is not important, since almost half of the Mainland students highlighted the pivotal role of Cantonese-proficiency in the friendship development with local students. Also, Cantonese is frequently reported by Mainland students as the main barrier to local activity participation stage (ML-06/ML-03/ML-12).

The less perceived importance of Cantonese-course is probably because the students prefer to learn Cantonese in practice, rather than attending the courses. However, this study showed that the students still lack of confidence to speak Cantonese, which and join Cantonese-speaking activities:

> When I was invited to local activities, I would firstly ask if they can speak Putonghua. If yes, then I will go. If English, I will hesitate, but can still attend. If all Cantonese, I will surely not join (ML-09)
>
> When there are Mainland students in the classroom discussion, we seldom talk with each other and discuss with co-national peers separately. My Cantonese is so poor, so do they. (ML-01)

The above sharing showed that the intercultural communication is more dependent on the language confidence, rather than the actual language proficiency. As noted by Dörnyei and Schmidt (2001), "*language learning is one of the most face-threatening university subjects*" (p. 9), while the language learning anxiety is weakest for children, and strongest for adults (MacIntyre et al. 1998), which would affect their L2 usage in a host-community that they are unfamiliar with (Clement and Noel 2001). It revealed that more encouragement of speaking L2 from the school is needed, rather than solely providing students with language training.

Moreover, it is found that some Mainland students hold a subjective expectation of local's language choice:

> Some Hong Kong people are not willing to speak Putonghua. This is not because of poor proficiency, they just do not want to speak it: "Why should I speak Putonghua? Why would the University develop Putonghua curriculum? The Mainland student should integrate with us, we should not accommodate them" (ML-03)

From the view of Mainland students, the willingness to speak Putonghua (PTH) is considered as an indicator of local's hospitality, whereas it is not agreed by the SAO and Hong Kong students:

> Do in Rome as Rome does. The Cantonese is the mother-tongue of most local students, it is unrealistic for you to ask local students to accommodate you. If you need to integrate into the local community, you must try to speak (Cantonese) (SAO).
>
> I am not good at Putonghua. I thought both of us should compromise and use English, which is the second language for both of us. There is no reason to expect me to follow you. If people do not understand what you say, and you still insist, no one will want to communicate with you (HK-04)

The unrealistic expectation of Mainland students may be explained by the concept of Language standardization. When the Putonghua becomes the national language and acquired prestige, all dialects would be considered as the unstandardized language and need to be "corrected" (Rosa 2016). The Mainland student may not place such expectation on the local student in English-speaking countries, but Hong Kong, as it is already a part of China.

## Less Effective University-Initiatives as Perceived by Students

### Cultural Event and Tour

Every year, the University organizes different visiting activities, such as the cultural Tour to Central District, Tsz Shan Monastery, and Legislative Council in 2018/2019 (SAO 2019). In the view of introducing Hong Kong, the local cultural tour may be a successful event, whereas it is an ineffective approach to facilitate intercultural interactions as perceived by Mainland students:

> I joined the SAO activities before. Most participants are Mainland students, and most Hong Kong students are over year 3. The local peers in the same cohort seldom join us. It occupies too much Wednesday and Weekend time, which is their "golden time" to concentrate on their own work (ML-05)
>
> Most SAO activities are designed for the Mainland students, such as the visit to the peak and the Stanley beach, whereas there were only very few local students. Perhaps they have been there many times already (ML-09).
>
> I have joined a visiting tour to Stanley. However, the local students would only play among themselves, so do the Mainland students. We seldom communicate with each other (ML-01)

The above sharing revealed two problems (i) lacking attractiveness to local students and (ii) unfitting schedule. It is consistent with Chiu's study that most off-campus cultural visits are not attractive enough to local students and this makes the activity no more intercultural (Chiu 2014). Indeed, the SAO manager also acknowledged the problem, whereas he suggested that they still have to focus on the Mainland students' interest first as it is their main responsibility. Also, it is unrealistic to focus on attracting local participants. It is because they have too many activities, such as doing part-time or maintaining other local social networks.

Instead of recruiting local students as participants, the SAO manager focused on inviting more local student-mentors and expected that individual friendships would be developed through the mentor-mentee interaction. SAO would encourage local students in different ways.

First, SAO would provide the "letter of achievement" so that the student-mentors could claim their intercultural experience in their CV (curriculum vitae). Second, the SAO would provide the opportunity for local students to express their strength by organizing different events. For example, SAO would recruit the students who are majoring in Chinese Education to be the Student Instructors. SAO only coach them briefly at the beginning, and they would prepare all teaching materials and have the full autonomy to plan the Cantonese-lesson. Third, SAO would seek financial support from the University and recruits the student-mentors with a Part-time salary. Although different incentives were provided, the SAO admitted that the self-willingness of intercultural interaction is still the main reason that attracts local students to join.

### Accommodation Arrangement

Besides the SAO support, the university arrangement mainly involves student's accommodation, administration, and infrastructure, where the students were grouped in the class, hostel or program randomly. In this interview, the students were aware of whether they could provide a rich opportunity for intercultural interaction:

> Our hostel would try to group the students with the same language or cultural background. Students with different cultural background seldom live together... Mainland students often have higher priority when getting hostel accommodation and choose their roommates from the co-national peers (HK-01)
>
> The Mainland students in the hostel have a strong social tie, whereas most local students live at home and always rush to the shuttle-bus station immediately after the lesson. Though we are in the same campus, we seldom meet each other outside the classroom (ML-04)

The above finding showed that the hostel accommodation is considered as an important platform to maintain frequent intercultural interaction. However, the cultural difference is considered as a potential problem in the view of hostel manager, rather than an opportunity of sharing. It may be a reasonable arrangement in the managerial perspective, whereas it may also reduce the opportunity of intercultural interaction in daily life.

### Mandatory Grouping at the Classroom Level

Although the previous section suggested that physical propinquity plays an important role in intercultural communication and relationship development, it is not entirely applicable to academic activities. In this study, 20% students reported that their lecturers tried to promote intercultural communication yet its effectiveness still debatable as some of these initiatives are reported to be ineffective as well.

According to the interview, the lecturer would have three ways to facilitate the Mainland-HK

communication in the lesson. The first way is to include it in the grading criteria:

> We seldom communicate with each other until the lecturer stated that he only gives high grades if we ask questions to the presenter. Then the Mainland students started to approach me (HK-01)
>
> The lecturer will ask us to include non-local students in every group for classroom discussion (HK-02)

The second way is to include Mainland students during the instruction, which the Mainland students are invited to share their first-hand experience to verify the teaching materials:

> Our topics often involve the comparison of education systems between Taiwan, Hong Kong and Mainland China. The lecturer would invite us to share the experience, and the local students are so interested in our sharing. We often continue the sharing during the break. (ML-09)

In the interview, the Mainland students reflected that they are more comfortable with this one, though such one-to-group setting hardly leads to further communication after class. However, some lecturers may not have careful consideration about it, which may unintendedly create the intercultural conflict:

> The lecturer plays a game and invites us to share the first impression about Mainland people. My groupmate suggested "dirty" and "noisy," which makes me really angry. So I also say "Kong Girl" (Girls with undesirable personality, e.g. materialistic, self-centered and bad-tempered) when describing the Hong Kong people (ML-08)

The third way is to implement the "mandatory grouping" in group project. However, it is not welcomed by local students. For example:

> When the lecturer asked us to accept her, we were a bit hesitant as we were worried about the communication. And, she seems to be quite sensitive. However, it is only a micro-teaching, which should not be a problem (HK-04)
>
> During the classroom discussion, I only talk with my friend, and she discusses with her Mainland peers also. Though we are in the same group, we would discuss separately. My Putonghua is so poor (HK-02)
>
> The Mainland students may be marginalized if they are the minority in the group. . .The lecturer could encourage us, but it is still students' own choice on whether they accept or not (HK-01)

The ineffectiveness of mandatory groupings is related to the fact that it violates the voluntary nature of friendship (Pahl 2000; Beer 2001; Keller 2004). Indeed, relationship development may be at risk from the involuntary interaction because of its inability to ensure meaningful communication, equal status, intimacy (Hamberger and Hewstone 1997). From the above, the students may gain the negative experience of intercultural interaction due to the language barrier, which may make them less likely to be involved in the intercultural communication afterwards.

This finding provides an alternative view to the assumption of Intergroup-contact theory, where more frequent contact does not always lead to a more positive outcome. Indeed, previous studies have suggested that the impact of superficial contact is highly conditioned by the characteristics of subjective contact experiences. For example, Barlow et al. (2012) found that actual intergroup contact increases prejudice towards out-group members when the majority hold negative (i.e., unpleasant) contact experiences. Therefore, the university needs to make more preparation in advance, rather than simply putting a diverse group of students together.

## Conclusion and Implication

To summarize, there was considerable support for promoting intercultural communication and friendship despite having room for improvement.

In general, the student-led activities (e.g., physical and social activities, common interest, and overseas exchange) are perceived as more effective in promoting the intercultural communication and friendship. It helps the establishment of the relational identity, which is the key to successful integration as it encourages the student sharing and fades away the boundaries of regional identities. Moreover, they often promote the frequent, sustainable, and positive interaction which would be of mutual benefit to each other.

The indirect support of the university-led activities is also perceived as effective. The Cantonese-learning course, for example, is the most appreciated and useful one in the view of Mainland

students as it equips them with basic language proficiency for the daily interactions. Second, the Buddy matching program, e.g., Global Ambassador or Mentorship with senior students, provides a supportive environment to Mainland students' for better sociocultural and academic adaptation.

By contrast, the local cultural tour and mandatory grouping in the class are reported as the less effective initiatives. One of the reasons is that those activities do not always fit with the interest or schedule of local students and hence making them less attractive to locals. Also, the language barrier prevents or limits the academic and social communication between Mainland and Hong Kong students.

The findings of this study have several implications that may help University managers to identify practical and effective interventions for improving intercultural communication and friendship.

### Sustainability of the Activity

First, this study sharpened awareness of ensuring sustainable interaction after the activities. In this study, students reported that they had positive interaction with local friends and exchanged their contact during the orientation-camp, cultural tours, or university events, whereas friendship takes time to manifest and does not always materialize after the first encounter. As a result, some students hesitate to participate again due to a lack of confidence in keeping such a fleeting relationship. Addressing this concern, the university should create an inclusive social environment and group students with common background (e.g., from the same subject or hostel) together in different activities, so that it becomes easier to maintain the social tie with their relational identity at certain aspects.

### Good Matching of Students' Mutual Benefit

Second, this study illustrates avenues whereby Mainland and Hong Kong students join the activities for mutual benefit. In previous studies, the lack of local students' participation in the intercultural activities is frequently highlighted, whereas very few studies are directed towards how to motivate them to participate (Chiu 2014; Ma 2012). It is reconfirmed in this study that the the university-led activity is generally less attractive to local students. However, the university has to target the Mainland students first, though it acknowledged the limitation.

To compromise, the University tends to attract the local students to be the mentor or instructor, rather than the participant. The university tried to assure that both Mainland and Hong Kong students can gain something out of the relationship (e.g., social integration versus the practice of a certain language). To local students, it would be good to let them know that not only could the intercultural activities provide an opportunity to practice Putonghua, but also help them gain teaching experience and develop leadership skills during the process. Furthermore, an extra encouragement for students' participation could be provided such as part-time employment contracts and the provision of letters of achievement.

The emphasis of the tangible reward is consistent with the Social Exchange Theory, where the potential benefit as perceived by individuals indicates the attractiveness and serves as the basis of the long-lasting relationship (Sunnafrank 1990; Ramirez et al. 2010). In other words, the students would have more motivation to deepen the relationship if they know what benefits they can receive.

However, to achieve the above objectives, it is necessary to explore what expectation or strength they have, so that the university could provide better matching of the incoming students to the local buddies.

### Shaping Expectation

In the light of all of these practical implications, universities may need to reconceptualize the traditional view of the students'. During the interview, it was found that Mainland students tend to view the academic and social interactions from a zero-sum perspective. They often give academic interactions the highest priority over recreation, social development, and other activities. However, different studies showed that social support with host-nationals could help nonlocal students learn a series of culturally relevant skills, facilitate their academic success (Furnham 2004; Ward et al. 2005; Bista and Foster 2016), and overcome

their psychological stress and loneliness (Bartram and Casimir 2007).

Therefore, to encourage more intercultural communication, the university have to change their mindsets and let students know about the benefit of gaining social support. Also, the student needs to realize that learning does not only happen in the classroom, but also takes place within the intercultural interactions every moment. Moreover, the University staff must themselves be highly efficient and effective intercultural learners, with the skills to encourage student integration rather than keeping it casual.

### Higher Level of Collaboration with Student Union, Societies, and Others

In this study, the student-led activities are perceived as more effective in terms of promoting intercultural communication and friendship development; however, the student support unit only had a loose connection with the student union, societies, and hostel-management committee, which were limited to experience and information sharing. To offer more systematic support, the University should carry more weight in student-led activities and take the partnership to a higher level of collaboration, such as providing financial support, coaching the students, or inviting them to propose intercultural activities. The University could also coach the students and let them pay particular attention to help others, which drive the buddy participants towards a meaningful membership. However, it is worth noting that the University-student collaboration should be on an equal basis. The university should offer support and experience sharing, rather than adopting a "monitoring" approach. It should provide more autonomy to students, since the adolescent would have a better understanding about what other students need (Steinberg and Schwartz 2000).

## Limitation

Several limitations are acknowledged in this study. First, we invited the students who self-reported as "having a satisfied level of intercultural communication." Though this study provides insight into the students' views about the effectiveness of different university initiatives, our analysis does not include the students who failed to initiate any intercultural communication. Future research should examine what challenges or difficulties are experienced by those students and explore how Universities could further encourage them. Second, the sample size is small. It is appropriate for an exploratory study, whereas it limited our ability to generalize our findings in other university contexts. However, despite these limitations, the present exploratory study provides useful insights into the subjective experience and perceptions of the university's initiatives, which offer a useful heuristic starting point for future work examining the university policy and intercultural communication and friendship development.

# Intergovernmental Relations in Japan: Local Government Participation in National Policy-Making

Ken Victor Leonard Hijino
Graduate School of Law, Kyoto University, Kyoto, Japan

## Synonyms

Intergovernmental relations/dynamics; Local and national government policy coordination and conflict

## Definitions

Coordination over policy that is shared or overlapping across levels of government; administrative and partisan channels of interaction/coordination between central and local government.

## Introduction

An important element of intergovernmental relations (IGR) in modern democracies are the various channels by which different levels of government coordinate over policy that is shared or overlapping across levels. The need for greater coordination, vertically between local, national, and supranational governments, has been driven by trends affecting most states. These include an expanding welfare state, the standardization of public services across regions, increasingly interdependent and complex policy areas which cannot be exclusively dealt with by one level alone, and demands for greater policy autonomy and ownership from local governments (Bolleyer 2009; Loughlin 2007; Bolleyer et al. 2014).

A range of formal/informal and administrative/partisan channels exists by which local governments engage with the national policy-making process. They include, for example, secondary chambers in national legislature which directly represent local governments and give them veto powers over national laws affecting local governments (such as the German Bundesrat), regular meetings of executives and bureaucrats from different levels of government (such as the Canadian First Minister's conferences), mechanisms to resolve disputes across government levels (such as the UK Joint Ministerial Committee), or procedures in which local governments provide feedback and express preferences over national policy (such as the Swedish *remiss* system). Various informal (non-statutory), personal interactions between individual actors at different levels of government can also play a significant coordinative role.

In addition to these administrative channels, local actors resort to partisan routes to exert influence in the national arena. These can be formal intraparty channels and arenas which link local politicians and party organizations to the national level of the party. In addition, less formal interactions through personal connections between national and local party officials can lead to coordination of decisions over policy decisions at both levels.

This entry, then, briefly describes and explains the recent evolution of such IGR dynamics in Japan. Specifically, it looks at the various routes by which Japanese local governments participate in the national political arena. It will explain how local governments possess both administrative and partisan channels to influence national policy-making in Japan. It argues that decentralization and increased multilevel partisan incongruence (where different parties control different levels of government) in recent decades has led to more conflictual relations between central and local governments. This trend has been accompanied with the establishment of new formal mechanisms of IGR and an expanded role for more traditional channels and fora linking the two levels.

## Traditional Administrative and Partisan Routes of IGR in Japan

Japan's modern constitution (Articles 92–95) guarantees local autonomy and the establishment of local government authorities with directly elected executives and legislatures that exercise administrative and legislative power within the scope of national law. The Local Autonomy Act, adopted simultaneously with the Constitution in 1947, further specifies the basic organization and operation of these local governments. The law specifies two tiers of local authorities – prefectural and municipal governments, of which in 2017 there were 47 and 1,718, respectively.

The Constitution and Local Autonomy Act stipulates a number of mechanisms by which local governments may express their preferences over and indirectly influence national policy-making. The following are what can be considered the more traditional mechanisms of local participation in national policy-making, which have been complemented by new mechanism which emerged around the mid-1990s.

First, Article 95 of the constitution requires the central government to conduct a local referendum if it seeks to enact special laws applicable only to a specific local government. This provision gives local communities an opportunity to reject

national policy which affects them exclusively. Such special laws requiring local referendums, however, have not been enacted since 1952.

Second, Article 99 of the Local Government Act grants Japanese local legislatures to pass "written opinions" (*ikensho*) on matters relating to the public good of local government. WOs are passed by prefectural and municipal legislatures and are addressed and submitted to the Diet (usually to the Lower House and/or Upper House chairman) and/or the executive (usually to specific ministries and ministers). Oftentimes these written opinions express local support or opposition to national decisions that are being planned or have been legislated. Although not legally binding, these WOs tend to be reported in the media and signal to the general public the reservations or support a local legislature may have for national policy (Hijino 2017).

Third, Article 16 of the Constitution stipulates the right to petition for all individuals and legal entities, including local governments. Diet Act no. 77 grants local governments the right to formally appeal to national legislature and ministries (Narita 1979, 5). These petitions, submitted by local government chief executives or chairpersons of local assemblies, are screened by relevant legislative committees in Diet or within ministries, and for those selected, the government must report on how it processed the appeals. There is no legal requirement for public bodies to act upon the contents of these petitions, however (Harada 2010, 127).

Fourth, there are a number of ad hoc channels by which local governments and their representatives are asked to provide comment over national policy matters. Certain laws (such as city planning or pollution controls) have included provisions which oblige central government ministries to conduct hearings of affected local governments before policy implementation. Local government representatives are also invited to provide testimony and comment in national advisory councils (such as the Local Government System Research Council) relating to local government issues as experts or affected parties (Narita 1979).

Besides these channels of IGR, various partisan channels have linked national and local governments, providing a more influential route for local preferences to be reflected in national policy-making.

Muramatsu (1988) indicates how local actors drew out benefits from the center by participating in a bottom-up and inclusive policy-making process. This bottom-up dynamic involved a "rugby scrum" linking local politicians, local governments, local Diet members, and national-level bureaucrats (Muramatsu 2010). Policy demands were channeled upward to the ruling party and coordinated among ministries and various sectional interest groups. Local governments, through local politicians representing these areas, competed among each other in "horizontal political competition" to capture a greater share of expanding governmental spending to various regions (Muramatsu 1988).

Local politics influenced national policy not only through such vertical linkages within the ruling party at national and local level but also in providing an arena for opposition parties to challenge the center. During the mid-1960s and 1970s, local governments controlled by leftist governors and mayors challenged local and national conservatives on a platform questioning unregulated growth (Flanagan et al. 1980). These socialist- and/or communist-backed governors implemented local ordinances expanding welfare services and enforcing pollution regulations which superseded or even contravened national laws and regulations. Many of these initiatives were then copied by other local governments or were co-opted into national standards. Local opposition thus served to alter national policy by representing policy preferences which could not emerge nationally.

These partisan channels were particularly important through much of the postwar period, enabling local preferences to shape national policy even though the state was administratively and fiscally centralized. A notable feature which enabled such strong bottom-up influence from local level into national policy-making was the highly decentralized, but vertically integrated

nature of the ruling party (Fukui and Fukai 1996) as well as the fact that the same party (the Liberal Democratic Party) dominated many of the national and local legislatures in the postwar period, especially in rural areas (Scheiner 2006). The LDP's national network provided formal coordinative arenas over policy (such as the prefectural policy research councils) as well as informal vertical linkages connecting national and local politicians. These linkages helped transmit local demands into national policy, both programmatic and particularistic.

## Evolving Channels of IGR Since the 1990s

These key features shaping IGR in Japan were altered considerably since the late 1990s, however. Hijino (2017) identifies several trends leading to a decoupling of traditional multilevel linkages during this period. Decentralization reforms since 2000 expanded local autonomy and an overall reduction in central government grants and subsidies to local governments (prominently between 2000 and 2006) reduced fiscal links to the center. Electoral system reforms (1994) at national level and municipal mergers (2000–2003) weakened vertical intraparty linkage between national and local politicians. And an overall increase in electoral volatility nationally as well as the rise of independent governors since the mid-1990s has led to more partisan incongruence between national and local levels of government.

As local government autonomy expanded and partisan links weakened across levels, various new channels of formal IGR have emerged to coordinate between levels.

First, as part of the Omnibus Decentralization Act implemented in 2000, a Central and Local Government Dispute Management Council was established to arbitrate between national and local governments, along with rules of how local governments can sue the central government over interference (Local Government Law Article 250:7–20, 251:5). The system was established as a way to protect local government autonomy from unwanted encroachment and interference from central government ministries. Since its implementation, only three local governments (Yokohama city, Niigata prefecture, and Okinawa prefecture) have sought dispute arbitration through this system, although in two of these cases the committee rejected the request for arbitration.

Second, an arena of discussions between central and local government representatives was established between 2004 and 2006 on an ad hoc basis to negotiate over the highly contested content of fiscal decentralization policy. Following this initial experiment, local government representative (led by the National Governors Association) sought to institutionalize the "forum of discussions between central government and regions." In 2011, the Democratic Party of Japan administration passed a law to institutionalize these meetings. The committee consists of the cabinet chief secretary and ministers but not the prime minister and the representatives of the six local government organizations. The six organizations are national associations representing governors, city mayors, town and village mayors, as well as prefectural, city, and town/village assemblies. Topics have covered a range of topics from tax and welfare, local economic revitalization, and finances, as well as decentralization measures.

Evaluations of how effectively local governments have been able to collectively bargain for their interests in this forum remain divided. The earlier forums, having no legal basis and thus unable to bind policy decisions, became merely an informal place for local governments to express preferences, rather than a place where decisions took place (Kanai 2008). Even after being regularized and institutionalized since 2011, the outcomes of discussions in these fora do not bind central government behavior. Yet there are signs that some local government demands were reflected in eventual policy in the round of meetings in 2011 (Oosaka 2012). In addition, there are concerns as to whether the diverse interests between wealthier urban local governments and smaller, poorer rural local

governments, among other divisions, can be effectively represented by these national umbrella organizations.

Third, there has been a further expansion of channels in which local governments can express opinions on national policy. The addition of Article 263:3–2 in the revision of Local Government Law in 1993 provides the right to the six national local government associations to collectively express opinions to the cabinet or Diet on matters affecting local government. This channel was further strengthened in 2000 with an addition of a clause requiring the central government to provide relevant information prior to formulating laws or cabinet orders which affect local governments. Likewise in 2000, Article 17.4 was added to the Local Allocation Tax Law giving local governments right to provide opinion on how local grants are calculated. Thus far the local government national organizations have submitted comments through the Article 263:3–2 mechanism to the central government only twice.

Fourth, the collective bargaining role of the National Governor's Association changed considerably since the mid-1990s. NGA meetings were traditionally politically neutral and ceremonial, but these became more active in negotiations over fiscal decentralization reforms under the Koizumi administration (2000–2006). For example, the NGA meeting hosted by Gifu prefecture in 2003 was unofficially but popularly called "the NGA which fights." During this meeting, prepared statements were replaced by free debates, and the rules for selecting the NGA chairman were changed from discussion to majority vote. NGA meetings increased in frequency under the Gifu governor who became the first NGA chairman to be selected under the new election procedure. The central government also began since 2003 to host annual "government-hosted NGA meeting," regularizing these collective discussions with governors.

The NGA also has been more active in publically pressuring the central government over various national policy decisions. The NGA has increasingly passed resolutions and made public appeals (many of them labeled "emergency" appeals or demands) against national policy since 2000 (Hijino 2017). The association for governors also stepped away from maintaining strict partisan neutrality in the 2005 general election by assessing and ranking party platform promises relating to decentralization and local government. The NGA has continued with this practice of evaluating party manifestos.

Fifth, although not intended as a mechanism for local governments to engage in national policy, the emergence of local referendums based on bylaws since the mid-1990s has been used to signal local preferences on national projects. Non-binding local referendums on the siting and usage of nuclear power plant and military base facilities have been implemented by various municipalities since the first such referendum occurred in 1996 (Hitomi 2008) (Table 1).

Finally, not only have these new and expanded forms of IGR emerged since the 1990s, but there is also evidence of more active use of traditional forms of IGR. Hijino (2016) traces an increase in the passing of written opinions by local prefectural assemblies since the mid-1990s, as local politicians (both from the ruling and opposition parties) opposed various top-down national policies seen to damage local interests. In particular, there was a surge of such written opinions during the administration of the Democratic Party of Japan, which resulted in widespread partisan incongruence between national and local levels between 2009 and 2012. Even under congruent conditions, local party organizations, legislatures, and governors have challenged major national policy projects to defend territorial interests through a variety of channels. This has taken place through administrative routes such as written opinions but also by diverging from and campaigning against national policy platforms (Hijino 2016, 2017).

## The Dynamics of Decentralization, Partisan Incongruence, and IGR

Although the effectiveness of these new institutionalized channels for securing local

**Intergovernmental Relations in Japan: Local Government Participation in National Policy-Making, Table 1** List of formal IGR channels by which local governments engage in national arena in Japan

| IGR channel | Relevant law | Year implemented |
|---|---|---|
| Local referendums for national laws affecting only specific local governments | Constitution, Article 95 | 1947 |
| Right of local legislatures to submit written opinions | Local Government Law, Article 99 | 1947 |
| Right to petition | Constitution, Article 16 | 1947 |
| Ad hoc laws obliging consultation with local representatives | Various | Various |

| National/local dispute resolution committee | Local Government Law, Article 250:7–20, 251:5 | 2000 |
| Forum of discussion between national and local governments | Law concerning the forum of discussion between national and local governments | 2011 |
| Local government national organizations right to submit opinions | Local Government Law, Article 263:3, 2–5 | 1993 (expanded in 2000) |
| Right to submit opinions on local grant calculations | Local Allocation Tax Law, Article 17.4 | 2000 |
| Local referendums based on bylaws | Various local bylaws | 1996 |

Compiled by author

government interests are ambiguous, these developments in IGR can be interpreted as a reaction to growing tensions between national and local governments since the 1990s. From below, local governments have reacted to undesired national policy (such as the reduction in redistributive grants through fiscal decentralization) by politicizing its national associations. They have also called for greater participation in national policy, particularly in collective multilateral fora, rather than through bilateral channels. From above, central governments have been trying to contain this tension by setting up new IGR channels and institutionalized fora. These mechanisms are based on the decentralization principle of "discussion on equal footing" but fall short of providing actual vetoing power to local governments over national policy.

Finally, it is notable that this expansion of more institutionalized and multilateral fora of IGR in Japan echoes some comparative findings in countries like the United Kingdom and Italy which have similarly undergone decentralization since the 1990s.

In the United Kingdom, devolution in 1999 moderately heightened intergovernmental and intraparty tensions between the central government and the devolved regions of Scotland, Wales, and Northern Ireland. Under initial conditions of multilevel partisan congruence, coordination was achieved primarily through informal intraparty channels. Formal mechanisms of IGR – including the Joint Ministerial Committee (JMC), a key executive body set up to coordinate between levels following devolution – were rarely used. Following the 2007 regional elections, however, multilevel congruence was lost which led to a moderate increase in the use of more formal and institutionalized channels of the JMC (McEwen et al. 2012). As in Japan, however, the continued dependence of regional governments to the center for both policy and fiscal resources and the lack of a constitutional basis for regional governments to effectively challenge the center have dampened overt conflicts. Pragmatic actions prevailed with

IGR becoming moderately more institutionalized and more multilateral, though informal bilateral negotiations between levels continued to be prevalent (Bolleyer et al. 2014).

In Italy, which underwent significant decentralization reform since the 1990s, local actors sought to expand their engagement in the national policy process through formal and more multilateral channels. Palermo and Wilson (2014) find that formal channels of intergovernmental coordination were overall weak, although new channels were created and others were made more institutionalized and prominent following decentralization, such as the State-Region Conference. Under the new context, territorial leaders have also sought to coordinate their negotiating position with the central government through collective lobby groups representing regions and municipalities. Despite some movement toward greater multilateral fora to defend local interests against the center, interactions tend to be dominated by informal, bilateral negotiations. Partisan incongruence was limited in Italy for most periods since the late 1990s, thereby largely limiting partisan-based conflicts between national and regional governments.

Despite these new intergovernmental channels and substantial decentralization reforms, local governments in all three states share difficulty in ensuring that local interests are reflected in critical national policies which affect them. This underlines the ultimately consultative nature of these engagement mechanisms in unitary states: local governments may be invited to speak, but there are no guarantees to be heard when legislation is made.

## Definition

The European order applies a domestic intergovernmental method to its internal relations in spite of the fact that it was originally created as an international organization.

The European intergovernmental method is applied horizontally between Member States or between the institutions and vertically between the Union and the Member States. It concerns the regulation and implementation of public policies through legislative and implementation acts. (For the latter, which are not dealt with here, the reader may refer to the entry *Executive facilitation of the European Commission and Member States.*)

## Introduction

Over time, the European Union system has acquired characteristics that make it unique: it is a new type of system that resembles neither the State nor other international bodies.

For its unprecedented characteristics, the European system can be defined as having a "supranational character" (as referenced in Article 9 of the Treaty of Paris, establishing the European Coal and Steel Community [the ECSC Treaty]), as in significant respect, it is more similar to a federal system than to a typical regional international organization. Thus, EU law, created and adopted mainly by majority vote (in the European Parliament and in the EU Council), is directly enforceable in Member States and toward the European citizens.

Normally, international law requires unanimity, as international agreements need to be approved by the Member States, and hence is not directly applicable: before being enforced they need to be adopted by member nations in accordance with their constitutions. Procedures of this type in the European system are now only a few and are disappearing.

In the EU context these principles remain valid for most policies when adopted through the "community method." In some areas the so-called intergovernmental method applies. These are sectors where the Member States preserve more autonomy when operating within the European institutions.

From this standpoint, the European Union is an interesting workshop for studying the two-tiered structure of intergovernmental relations.

Indeed, intergovernmental relations can be defined as policies of the confederal type, like common foreign and security policy, or as federal or unified policies, like customs policy, competition rules, the euro, etc. Hence European institutional relations unfold according to either of the two possible forms of the intergovernmental method: supranational relations, for confederal policies, and community/European relations, for those that are unified or federalized in the Treaties.

Whatever their form, intergovernmental relations, including supranational relations, do not come under public international law but are regulated by the legal order created by the European Treaties. This is evident in community relations, given the degree of unification that characterizes the system in these cases, and in supranational relations where acts adopted (with a few exceptions, see Article 42.2 of the Treaty on European Union [TEU]) take immediate effect in Member States.

On the other hand, supranational relations have to do exclusively with the relations between some European institutions and the Member States, while the community relations may concern all

the different levels of government: the European, state, and sub-state (regional, provincial, and municipal) levels of government, thus embodying what the literature refers to as intergovernmental relations.

## Foundation of the Intergovernmental Method

The application of the intergovernmental model in European relations has accompanied the European experience right from its very beginnings since the latter was founded on cooperation among European States, on the basis of "a destiny henceforward shared" and of the end of "age-old rivalries" (preamble of the ECSC Treaty). Over time this has led to the development of a background of intergovernmental cooperation and a set of processes whereby the method is applied.

Indeed, even though the European Union Treaty declares the principle of sincere cooperation between the Union and its Member States (Article 4.3 TEU) and applies it also to the relationships between the institutions (Article 13.2 TEU), it does not regulate, or it only roughly regulates, the forms of intergovernmental cooperation. Consequently, it is of fundamental importance to examine the inner workings of the European Union in order to understand how intergovernmental relationships materialize in practice (Klammert 2014; Chevallier-Govers 2013).

## The Origin of the European Intergovernmental Method

First, some EU parlance needs clarification. Intergovernmental Conferences (IGC) started out as international negotiations accompanying the development of the European system but became the vehicle for establishing the European Community's actual political objectives. In particular, the Intergovernmental Conferences have accompanied the incremental process of European integration, in accordance with the principles of the Schuman declaration, by using the so-called *Spaak* method, applied for the first time in 1956, when the agenda for the Intergovernmental Conference was drawn up to negotiate the contents of the future Rome Treaties.

The Spaak method was also applied by the Delors Committee to prepare the economic and monetary union (1988). The "Delors Report," drafted upon conclusion of the activities of the Committee, was transposed into the Maastricht Treaty (1992/93) which established the economic and monetary union.

The Maastricht Treaty changed the nature of the Intergovernmental Conferences by placing them within the European system, institutionalizing the European Council which was assigned the task to "define the general political guidelines thereof" (Article 4, par. 1, TEU). The Maastricht Treaty determined the composition of the European Council, the way it was to work, and the reports it would submit to the European Parliament (Article 4, par. 2 and 3, TEU). The Lisbon Treaty confirmed this institutional choice and regulated other aspects which thus far had been defined by practice, like the way in which resolutions were adopted (by consensus), and it envisaged, for the first time, the election of the President of the European Council (Article 14 TEU) (Mangiameli 2012).

The institutionalization of the European Council, within the European institutions, turned the political negotiation among heads of state and government of the Member States – which had hitherto been an international exercise – into a negotiation of the intergovernmental type.

## Interinstitutional Agreements as Tools of the Horizontal Intergovernmental Method

Apart from the European Council, the most evident expression of the horizontal European intergovernmental relationships can be found in the "interinstitutional agreements," considered to be

atypical acts of the European Union, which define the relationships and coordination modalities between the institutions.

The foundation of these agreements is the principle of fair cooperation that is applied in the relationships among the European institutions.

Regarding horizontal intergovernmental relationships, Declaration No. 3 attached to the Nice Treaty (2001) already envisaged the conclusion of interinstitutional agreements between the European Parliament, the Council, and the Commission to facilitate the implementation of Treaty provisions, without amending or completing the provisions of the Treaty itself. However, said statement was not legally binding.

With the Lisbon Treaty instead, interinstitutional cooperation was given a sounder legal foundation in Article 13, par. 2 TEU ("The institutions shall practice mutual sincere cooperation"). And within the scope of its general function of promoting the general interest of the Union, and within the scope of the competences enabling it to take action for this purpose, the Commission initiated "the annual and multiannual programming with a view to achieving Interinstitutional agreements" (Article 17, par. 1, TEU).

Furthermore, with regard to the procedures for legal acts, Article 295 (Treaty on the Functioning of the European Union [TFEU], which succeeded the Treaty Establishing the European Community [TEC] in 2007) refers to the relationships between the institutions (European Parliament, Council, and Commission) as "mutual consultations" pointing out that they are to make arrangements for cooperating through "common agreements"; and it adds that "to that end, they may, in compliance with the treaties, conclude interinstitutional agreements which may be of a binding nature." Consequently the interinstitutional agreements undoubtedly became something more than they were in origin, when they were mere political memoranda, and, as pointed out by the Court of Justice (Judgment 19 March 1996, C-25/94, *Commission* v. *the Council*), they may be legally and mutually binding on the institutions that sign them.

Among the instances of interinstitutional agreements, mention can be made of the interinstitutional agreement between the European Parliament and the Council concerning classified information held by the Council (12 March 2014); the interinstitutional agreement on budget discipline, cooperation, and management (2 December 2013); and the better lawmaking agreement between EU institutions (last version, May 2016). The latter is perhaps the most significant agreement of the European institutional system in that it regulates the horizontal intergovernmental procedures of legislative negotiation.

## Lawmaking Procedures: Horizontal Intergovernmental Relations

The European legislative procedure is quite different from the procedures followed in unitary states and even in federal states.

The most striking aspect is that neither the European Parliament nor the Council, which are the "decision-making chambers," has the power to initiate the legislative process. The Treaties attribute the power of lawmaking initiative to the Commission (Ponzano et al. 2012).

Hence the Commission plays an active role with respect to the other European institutions that operate in the legislative process. Indeed, Article 17.2 TEU states that "Union legislative acts may only be adopted on the basis of a Commission proposal, except where the Treaties provide otherwise," and it immediately adds that "other acts shall be adopted on the basis of a Commission proposal where the Treaties so provide." (Nugent and Rhinard 2015)

Even though the European Parliament and the Council may prompt the Commission to submit a draft legislative proposal, the Commission actually has the prevailing power in the lawmaking process. And its strongest expression is the draft budget that it submits to Parliament and to the Council every year (Article 314.2 TFEU).

Before a given proposal takes shape, before it is drafted and subsequently submitted to the European Parliament and to the Council for a resolution, the subject matter needs to be envisaged in the annual legislative program.

The annual work program of the Commission is submitted every year in late September after the report on the State of the Union is delivered to the European Parliament by the President of the Commission.

The Commission work program (CWP) is forwarded to the European Parliament in the very simple form of a "Communication of the Commission to the European Parliament, to the Council, and to the European Social and Economic Committee and to the Committee of the Regions." The CWP sets forth the priority actions of the Commission for the subsequent year. These priorities derive partly from the political orientations submitted by the Commission at the beginning of its mandate following discussions with the European Parliament and partly from the political indications set forth by the European Council on the occasion of the creation of the Commission after the elections of the European Parliament.

In practice, the orientations embodied in the proposals are laid out in the Communication of the Commission: the Communication describes, first of all, the key initiatives that determine the legislative priorities for the following year; secondly, it contains all the proposals for updating and amending the European legislation already in force; thirdly, under the title of pending priority proposals, it recalls the proposals formulated previously but not yet formalized in the presentation; fourthly, it indicates the proposals that have been withdrawn, because in the meantime the aims have been reached through other channels or because they have merely become obsolete; fifthly, it includes proposals for repealing previous acts.

In the past, the Union's work program was prepared in an informal manner by the three institutions involved in the European legislative process on the basis of expressions of interest made at the beginning of each year by Parliament, and the Council requests that the Commission would then enter into its program. Through the informal negotiations that would occur on those occasions, the relationship between the three institutions was rebalanced especially in favor of the European Parliament, since the Commission had a major institutional weight attributed to it by the Treaties and the Council de facto exercised a political role.

From a certain time onward, as pointed out earlier, legislative cooperation among the three bodies was coordinated through an interinstitutional agreement bearing the significant title of *Better Law Making* (Weber et al. 2017).

This agreement roughly retraces the steps of the lawmaking cycle and contains provisions concerning, among other things, the common objectives, the *programming* and instruments for better lawmaking such as the *impact assessment*, *consultation* with the stakeholders, and the ex post *assessment*; furthermore, these instruments should refer to the legislative acts, the delegated acts, and the implementation acts in order to enable *transparency*, *implementation*, and *simplification* of the European action.

The agreement states that the ordinary legislative procedure is to be based on regular contacts among the three institutions at each step of the procedure and that the three institutions shall be committed to further improving the activities carried out in the area of the ordinary lawmaking procedure, in accordance with the principles of fair cooperation, transparency, accountability, and efficiency (Curtin and Leino 2017).

According to the agreement, the three institutions agree that in particular the European Parliament and the Council, being co-legislators, should exercise their powers in conditions of equality and that the Commission should play the role of facilitator treating the two branches of the legislative authority in the same manner in full respect for the roles that the Treaties have attributed to the three institutions (Reh et al. 2011). For this purpose, transparency of the legislative procedures is to be ensured by an adequate management of the

tripartite negotiations (trilogues) (Curtin and Leino 2017).

## Lawmaking Procedures: Vertical Intergovernmental Relations

The provisions of the agreement on "Better Law Making" concerning horizontal cooperation among the three institutions are complemented by Protocol No. 1 on national parliaments. Article 1 of Protocol No. 1 envisages that "the Commission shall forward the annual legislative program as well as any other instruments of legislative planning or policy to national Parliaments, at the same time as to the European Parliament and the Council" (Casalena et al. 2013).

However, national parliaments cannot exercise any form of direct influence on the legislative program; at the most they can give indications to their respective governments who can intervene in the Council.

In the fourth recital of the Preamble, the interinstitutional agreement on "Better Law Making" recalls that "The three Institutions reiterate the role and responsibility of national Parliaments as laid down in the Treaties, in Protocol No. 1 on the role of National Parliaments in the European Union (. . .) and in Protocol No. 2 on the application of the principles of subsidiarity and proportionality" (Blanke et al. 2013).

In addition, with reference to legislative acts and with regard to the principle of the attribution of powers, in paragraph 25, the agreement states that "the Commission shall provide, in relation to each proposal, an explanation and justification to the European Parliament and to the Council regarding its choice of legal basis and type of legal act in the explanatory memorandum accompanying the proposal," and, if the proposal refers to the principles of subsidiarity and proportionality, it shall justify its application with the proposed measures and motivate the provisions by stating they are compatible with fundamental rights.

Protocol No 1 "on the role of national parliaments in the European Union" states that "the draft legislative acts sent to the European Parliament and to the Council shall be forwarded to national Parliaments" (Article 2 par. 1 and 3, Prot. No 1). In the case of the ordinary procedure, it is directly up to the Commission to forward the draft legislative acts to the national parliaments (Article 2, par. 3, Prot. No. 1).

An 8-week period elapses before the draft legislative act is "placed on a provisional agenda for the Council and the adoption of a position" (Article 4 of Prot. No. 1).

During this lapse of time, the national parliaments can send a reasoned opinion to the Presidents of the European Parliament, of the Council, and of the Commission if they consider that the draft legislative act intervenes in areas of concurrent competence (i.e., areas which do not fall within the exclusive competence of the European Union) and breaches the principle of subsidiarity.

Now, the exercise of concurrent competences by the EU (Mangiameli 2017), subject to compliance with the principle of subsidiarity, thanks to the provisions of Protocol No. 2 on the application of the principles of subsidiarity and proportionality, determines consequences of two types on the acts adopted. Indeed, the correct application of the abovementioned principles occurs through an ex ante control (of a political nature) and an ex post control (of a judicial nature).

The ex ante control is part of a circuit of intergovernmental relationships of the vertical type. Indeed, the provisions of the Protocol have proceduralized the principle of subsidiarity by envisaging, within the legislative procedure, a "sub-procedure" that is aimed at verifying, ex ante, compliance of a draft proposal with the principle itself. In case of breach, national parliaments can force the Commission to reconsider the legislative proposal through the "sub-procedure" constituted by the so-called *early warning system.* This is so because the national parliaments of the Member States are the real holders of the legislative competences regulated by the draft legislation of the European Commission.

Article 7 of the same Protocol sets forth the consequences that may derive from the ex ante control on the legislative process. Depending on the area of legislation, one third or one quarter of national parliaments can trigger the "yellow card procedure" by flagging the proposal. The Commission must in that case review its proposal and justify its decision to maintain, withdraw, or change the proposal. If more than half of the parliaments flag the proposal, the result is the "orange card procedure," where the Commission must justify to the European Parliament and the Council why the proposal does not go against subsidiarity.

When the national parliaments trigger the yellow or the orange card procedure, the proposal needs to be reexamined and the Commission is obliged to review it; moreover, the legislator of the Union (European Parliament and Council) can exercise special powers with regard to the principle of subsidiarity (Article 7, par. 3 letters a and b); namely, they can contradict the opinion expressed by the Commission: in one case, before the conclusion of the first reading, the European Parliament and the Council examine "the compatibility of the legislative proposal with the principle of subsidiarity, taking into special account the reasons expressed and shared by the majority of national parliaments, as well as the motivated reason of the Commission" (letter a); in the other case, one of the two European co-lawmakers can finally block the proposal because it breaches the principle of subsidiarity (letter b).

The so-called orange card has never been flashed, whereas the yellow card was triggered in three cases which, however, were not very significant.

## Conclusions

Intergovernmental relations in the European order have been a method whereby Member States and the European institutions have taken decisions, avoided conflicts of interest, and accompanied the process of European integration.

In some specific cases, for instance, the Intergovernmental Conferences, intergovernmental relations have been the premise for the institutionalization of some relations and modification of the institutional design of the Union and of the procedures themselves.

Within the framework of institutional collaboration, they have allowed for greater stability in the relationships between the institutions, attributing the right value to their political weight, to the specific competences of each Institution, and to the role played by each. This is the case especially for the lawmaking procedures, where horizontal intergovernmental relations have made it possible to give full legitimation to the European institutions through triangular negotiations and to their decisions by valorizing the co-decision principle (Council and European Parliament).

However, in some cases, intergovernmental relations have remained an instrument for merely coordinating the action of Member States, for instance, in the area of the common foreign and security policy, because the integration process is not advancing given the lack of political will which is precisely what intergovernmental relations need in order for them to play a proactive role in the advancement of government institutions.

Finally, given the unprecedented and sui generis nature of the construction of the European edifice, intergovernmental relations of the vertical type have consolidated their role through the so-called comitology (implementation activities of EU laws by appropriate committees under the European Commission watchfulness) in the relations between executive bodies, while in the relations between European institutions and national parliaments on legislative matters, they do not seem to find a satisfactory arrangement, even with regard to the application of the principle of subsidiarity. Indeed, the procedures provided by the protocols appear to be a "weak" solution.

National parliaments are assigned a merely negative role in that they are given the role of

"oversight" to be carried out only a posteriori, when the legislative proposal has already been formulated. National parliaments do not participate in the consultation process run by the Commission nor in the interinstitutional agreements that the Commission enters into with the Council and the European Parliament.

# Intermunicipal Cooperation

Davide Giacomini
Department of Economics and Management, University of Brescia, Brescia, Italy

## Synonyms

Intermunicipality

## Definition

Often municipal borders do not coincide with the appropriate scale for the delivery of services. In these cases, municipalities usually agree to operate jointly. IMC is when several municipalities, in order to obtain mutual benefits, decide to work together on some of the tasks assigned to them (Bel and Warner 2015). The term IMC means a stable collaboration relationship between two or several local governments, endowed with competences and resources.

## Introduction

In the last 40 years, devolution and outsourcing have led to a world of "networked government." In this context an important role has been played by municipalities: the smallest territorial units of public administration and the first tier of local self-government. There is an increasing demand for new ways to provide service to citizens throughout the intermunicipal cooperation (IMC). The intermunicipal cooperation is a recent phenomenon, even if in some countries the first experiences in this regard can be traced back to the nineteenth century. Nevertheless, even if not a complete innovation as actual practice, the IMC has only become a subject of study in recent years and albeit still peripheral in researches is gaining more attention among scholars of organization in the public sector. The intermunicipal cooperation

is also linked to phenomena detected in recent years. These phenomena, despite affecting the whole of society, impact mostly on municipalities. In fact, local authorities have greater responsibility than other levels of government to address issues such as suburbanization, metropolitan areas' evolution. Hence they have the necessity to achieve the "correct scaling" in order to provide efficient services to citizens. Municipalities, and especially smaller communities, encounter increasing difficulties in satisfying the demands and standards of their local governments (Hulst and van Montfort 2011). Many municipalities have been suffering from tight budgets and limited municipal autonomy to find additional resources; for these reasons, municipalities are required to provide a more efficient public service provision. Given that, several scholars from both fiscal federalism and administration research agreed on the fact that the historical borders of the municipalities do not satisfy the true requirements for an efficient provision of local public services (e.g., Bel et al. 2012). One of the policies traditionally proposed to reduce costs has been the cooperation between local governments. Rather than working separately, LGOs create intermunicipal consortia to provide public services jointly. The main advantages of the associated services are the potential for efficiency improvements derived from economies of scale and internalizing the cost and/or performance advantages. However, there is no unanimous consensus over the fact that IMC is actually cost effective. Scholars, policy makers, and professionals have been debating at great length on the conditions that would make IMC function optimally.

Moreover, it is fundamental to highlight that European intermunicipal cooperation contrast from the intermunicipality characteristics of the United States. In the case of United States, the cooperation is more commonly a contract that focuses responsibilities connected to the services provision to one of the municipalities (often assigned to the largest one). Generally, cooperative relations between local governments tend to be easier in countries with a high degree of fragmentation.

## Consequences of Intermunicipal Cooperation

The consequences of the IMC are varied. However, there is not a shared opinion about these consequences in the research gathered. The centralization of services and functions should lead to achieving economies of careful scaling, greater specialization of personnel, ability to introduce new services while reducing costs. However, in some cases, IMC can be a source of inefficiencies and poorer performance results. Delegation of service responsibilities to an array of local authorities can improve resilience and attention to local needs but at the same time, it can also create the so-called institutional collective action (ICA) dilemmas (Feiock 2013). By increasing organizational complexity through the IMC, it leads to a more exaggerated goal ambiguity. Numerous studies have confirmed that organizational goal ambiguity has harmful effects on public sector organizations and public servants. For this reason, it is fundamental to place the intermunicipal cooperation in organizational design path.

## Types of Intermunicipal Cooperation

In some countries intermunicipal cooperation has been active since the nineteenth century, while its current diffusion appears in complete accordance with the general trend of using governance and cooperation models based on horizontal agreements among public institutions. The United Kingdom's case represents a counter-trend. IMC has "not been part of the DNA of UK local government" for a few years, a less restrictive legislative environment and a National economic trend oriented to spending reduction created "what could be called a 'perfect storm'" (McGarvey 2012) leading local authorities to find more effective spending management tools cooperating with each other.

Nevertheless, local intermunicipal cooperation is still seen as one of the possible chances to solve cost-effectiveness problems in small municipalities, and there are just a few studies on the topic from the economic point of view as well as

concerning the efficiency of intermunicipality oriented policies.

As for the classification of the different forms of intermunicipal cooperation, the first distinction that can be made concerns the nature of intermunicipality agreements (Teles 2016). In this regard it is possible to distinguish between soft and hard cooperation. The first is characterized by low institutionalization, mostly informal relationships. It is usually a first step that allows you to become aware of the importance of a network and helps to build trust. On the other hand, the hard cooperation usually involves formal agreements, the rigid identification of the participants in the network and clear formalization of the decision-making process.

Hulst and Van Montfort's (2011) contribution to IMC classification appears of particular interest. Given the fact that there is a great variety of tasks, contexts, institutional levels, powers, and cooperation agreements, Hulst and Van Montfort highlight four basic forms:

- Quasi-regional governments
- Planning forums
- Service delivery organizations
- Service delivery agreements

*Quasi-regional governments* are long-term and standing organizations managed by municipalities and involved in local governance policies and supra-municipal planning in several sectors. They are given formal decision-making authority, financial resources, and their own financial statement. A council and an executive board, composed of delegate councillors of the participating local governments, usually manage quasi-regional governments. They are normally active in many administrative sectors and occasionally involved in services delivery. Quasi-regional governments are often in charge of activities including territorial planning and local social-economic development.

*Planning forums* are networks composed of local governments and other public or private organizations engaged in the coordination and planning of their respective policies or activities. Their institutional integration is lower than other IMC forms because participants maintain standing relations and interact on a regular basis. In this case, there is no formal decision-making authority. Planning forums are particularly active in public housing, environmental planning, and social-economic development.

*Service delivery organizations* are second-level institutions aimed at delivering public services. They can be entrusted with decision-making authority by the cooperating municipalities (or, in some cases, by other public organizations) or they can operate as delegated on the directions of individual municipalities.

*Service delivery agreements*, in conclusion, are based on the cooperation among institutions regulated by an agreement without implying the creation of any second-level institutions. In some cases, the agreement requires one of the partners, usually the largest municipality, to act as leader organization. In other cases, municipalities use agreements to improve their buying power towards suppliers.

Generally, the shape of intermunicipality adopted depends on the actor that has promoted it. In fact, if intermunicipality is directly promoted by the municipalities is more likely to adopt a form lighter and flexible while in the case in which it is promoted by central government is more likely to be favored a stable form as it was considered more suitable to achieve savings and efficiency improvements.

## Mandatory Intermunicipal Cooperation

In many cases, largely as a result of the spending review and the state spending control policies, the IMC is made compulsory for small municipalities. In this regard, it is interesting, as an example, the case of Italy that from 2010 initiated a mandatory IMC path for municipalities with less than 5,000 inhabitants. In Italy, there are about 8,000 municipalities, of which the 70.2% are the so-called "small municipalities" with a population within 5,000 inhabitants, in these towns resides the 17.1% of the total Italian population. In the Italian political system, municipalities supply several important public functions and services. Three

types of functions can be distinguished here: voluntary functions (e.g., local museums, swimming pools and theatres), mandatory functions (e.g., water and energy supply, schools, sewage treatment, waste disposal), and mandatory services covering higher-level government tasks (e.g., local elections). The introduction of mandatory associated management in Italy was based on specific choices of expenditure containment even if there is no evidence of any actual relation between IMC and public spending reductions. In particular, in accordance with the Law decree 95/2012 intermunicipal cooperation for the management of most of the municipal functions became mandatory for all municipalities with a maximum of 5,000 inhabitants (3,000 if they belonged or still belong to mountain communities):

(a) General administration, financial and spending management and control
(b) Management of public and welfare services in the municipalities, including public transport
(c) Land charges register management
(d) Urban and housing planning in the municipality and participation in territorial planning at a supra-municipal level
(e) Planning, civil protection, and first aid coordination activities within the municipality
(f) Organization and management of garbage collection and disposal service, and related tax collecting
(g) Local social service planning, management, and delivery to the citizens, in accordance with article 118, fourth clause, of the Constitutional Law
(h) School building (for the part provinces are not entrusted with), planning and management of school services
(i) Municipal and local administrative police
(j) General registry, electoral and statistics offices management, for the functions carried out on part and for the central government
(k) Statistical services

The introduction of the mandatory IMC is, however, never simple. In many cases, resistances of employees and politicians are detected, as shown in a recent study (Giacomini and Sancino 2016).

## Conclusion

The debate about the need to change the management of municipalities in order to promote corporative management models and to adapt them to the management of local authorities dates back to 30 years ago. The need to introduce mechanisms to improve the efficiency of local authorities is urging and the intermunicipal cooperation can be a virtuous reform to the world of local government. However, its effects can not be taken for granted and not necessarily are always positive. As highlighted by several authors, there are also cases of ineffectiveness and cost increase. It is important that the path towards intermunicipal cooperation is always accompanied by reflections regarding the organizational structure and the involvement of workers and politicians and with an ex ante evaluation of the costs and benefits obtainable. Even the same assessment of the results achieved is not easy. Performances have been traditionally analyzed mainly at the macro or at the micro level. The intermunicipal cooperation is exactly in the middle, between the micro and the macro, and therefore traditional approaches may be insufficient for a full assessment of the effectiveness of the IMC.

## Definition

A form of aid governance in which municipalities send their public servants to help needy municipalities affected by a disaster.

## Introduction: Inter-municipal Aid as a Means of Mitigating the Risk Associated with Manpower Insufficiency

Japan is arguably one of the most disaster-prone countries in the world, a place where national and subnational governments jointly manage a range of natural disasters such as earthquakes, tsunamis, and floods with divided responsibilities. The subnational governments consist of 47 prefectures and 1,741 municipalities (that is, cities, towns, villages, or Tokyo districts). Municipalities in particular play important roles in providing frontline services during an emergency response, and during the recovery and reconstruction stage. They are generally in a better position to do so than the national and prefectural governments owing to their proximity to communities. However, such a decentralized system involves risk when, on infrequent occasions, it comes to managing a large-scale disaster.

The risk has to do with severe manpower shortages in municipal offices, both during the emergency response phase and during recovery and reconstruction. The 2011 Great East Japan Earthquake and resulting tsunami (hereafter referred to as the 3.11 disasters) that hit north-eastern region of Japan called Tohoku drew renewed attentions to this risk, due to the loss of many municipal officers in the disasters and the overwhelming amount of emergency, recovery, and reconstruction work demanded by the unprecedentedly large scale of the devastation (Aoki 2015b, 2016; Sakamoto and Yamori 2012; Yamaguchi et al. 2013). The manpower shortages severely affected the functioning of municipal offices. This, in turn, prompted municipalities nationwide that were unaffected by the tsunami to dispatch officials to the affected municipalities. These efforts at inter-municipal aid in the form of manpower are the focus of this chapter.

The next section describes four types of inter-municipal manpower aid in Japan. The third section discusses salient policy considerations in the design of inter-municipal manpower aid. Throughout, the term *manpower* refers exclusively to municipal government officers, although needy municipalities also receive manpower aid from the central and prefectural governments. Furthermore, *manpower aid* is used in this chapter to mean personnel who work for needy municipal governments and their third sector, but not personnel who work for the private sector or who help individual victims directly.

## Types of Inter-municipal Manpower Aid

As elaborated in a previous study (Aoki 2015b), Japanese inter-municipal manpower aid can be largely classified into four types. Two of them are *ex ante*, meaning that the arrangements are made in anticipation of a future natural disaster; these are (i) the Emergency Fire Response Team (EFRT) and (ii) *ex-ante* mutual aid agreements. The other two types are *ex-post* arrangements, meaning they are instituted after a natural disaster occurs. These are (iii) *ex-post* mutual aid agreements and (iv) centrally coordinated agreements. As discussed below, these four types of inter-municipal manpower aid differ with respect to the *predictability* of aid, defined as the certainty of receiving help from other municipalities once a natural disaster actually occurs (Aoki 2015b). Predictability is higher for *ex-ante* arrangements, and it is also determined by the size and coverage of membership, because these two factors ensure the availability of manpower that can be dispatched when called up.

The first type of manpower aid is the EFRT. Formed in 1995 in response to the lessons learned from the Hanshin-Awaji earthquake that year, the EFRT became enshrined in the Fire and Disaster Management Organization Act in 2003 (effective 2004). It comprises nationwide municipal firefighting and prefectural air fire teams. These teams conduct regular training in the prefectural and regional blocks to prepare for future disasters, and they are called into joint action by the national Fire and Disaster Management Agency at the time of a disaster so large that the municipalities alone are unable to handle it. As of January 2014, 4,600 firefighting teams nationwide were registered (Ministry of Internal Affairs and Communications [MIC] 2014). This participation by its sheer size ensures great predictability, but to further prepare for the possibility of a Nankai Trough Earthquake, the Japanese government currently aims to reach 6,000 teams by 2018 (MIC 2014).

The second type of *ex-ante* aid agreement is a mutual aid agreement into which municipalities voluntarily enter to secure aid during the future occurrence of an unforeseen disaster. This aid is generally not only in the form of emergency response supplies, such as food and water, medical supplies, and transport, but also in the form of manpower dispatched to help municipal offices operate evacuation sites and issue disaster-victim certificates, among other tasks. As of April 2016, 1,705 municipalities had mutual aid agreements with other municipalities (FDMA 2017). This constituted 97.9% of the municipalities in Japan, indicating how widespread these arrangements are. Municipalities can also enter into an aid agreement multilaterally. One example of this is an agreement among 21 large cities, including Tokyo and other ordinance-designated cities. However, even though the mutual agreement is multilateral, its membership is much smaller than the EFRT arrangement; this means there might be a limited pool of manpower available during a disaster, and hence, the aid through this agreement is less predictable than the commitment of the EFRT, although these two provide different services and, hence, complement one another.

The third type of inter-municipal aid is *ex-post* mutual aid agreements. Despite the making of *ex-ante* agreements, a need for *ex-post* arrangements arises for two reasons: (i) *ex-ante* mutual aid agreements are not able to mobilize enough manpower support, and (ii) manpower is needed for the recovery and reconstruction stages in the aftermath of a disaster, which are generally outside the scope of *ex-ante* mutual-aid agreements (Aoki 2017). Moreover, *ex-post* arrangements are not as predictable as *ex-ante* arrangements because they depend largely on municipalities' goodwill in the absence of prior promises and in the face of uncertainty about the possibility of receiving help in return in future. In the wake of the 3.11 disasters, some municipalities made a post-disaster decision to help needy municipalities in Tohoku, whereupon the central government helped the receiving municipalities cover expenses, including salaries and travel fees for incoming mid- to long-term manpower aid.

Nagoya City, for example, at its own discretion, launched unprecedented "whole-government" support to Rikuzentakata City, which had lost over 100 city government staff in the 3.11 disasters (Nagoya City 2016); this was unlike other mutual

aid agreements, where municipalities would send manpower to cover particular positions in a needy municipality, leading to a situation where the positions were filled by personnel from a variety of jurisdictions. Nagoya, instead, decided to holistically aid the Rikuzentakata City government and send manpower to wherever needs arose. Under this scheme, Nagoya sent 144 staff in 2011 during the emergency response and continued to send staff during the recovery and reconstruction stage, who helped the Rikuzentakata office issue certificates of residence, provide victims with health guidance, investigate afflicted houses, and so forth (Nagoya City n.a.).

The fourth and the last type of arrangement is also *ex-post*, but it is centrally coordinated, rather than directly arranged by the municipalities. In the wake of the 2011 tsunami, the Ministry of Internal Affairs and Communications (MIC), together with the Japan Association of City Mayors (JACM) and the National Association of Towns and Villages (NATV), launched a new scheme to garner manpower help from among municipalities nationwide. They played a coordinating role, with help from the prefectural governments, to identify the demands for manpower in their municipalities and disseminate this information to municipalities nationwide (see MIC (2011) for an illustration of this scheme). The Tohoku prefectures apportioned the manpower supply offered among the needy municipalities. These municipalities then entered into agreements with the sending municipalities. Under this scheme, 1,148 staff were sent for a short-term assignment in 2011. As for mid- to long-term aid, as of January 1, 2017, 2,637 staff (person-years) have been sent (JACM 2017). As with the *ex-post* inter-municipal aid arranged by municipalities on their own, the central government fully finances expenses for this mid- to long-term manpower aid.

## Emerging Policy Considerations Surrounding Inter-municipal Manpower Aid

Japan's arrangements for inter-municipal aid have evolved over time; recent progress and discourse after the 3.11 disasters involve the following considerations.

First, in light of the difficulty of mobilizing *ex-post* manpower help after the 3.11 disasters, municipalities were reminded of the importance of *ex-ante* arrangements. It is understandable that municipalities do not want to overburden themselves with an excessive number of *ex-ante* arrangements, because the occurrence of natural disasters is unpredictable, and entering into additional mutual aids agreement is not free of cost, as it increases a municipality's obligations and the likelihood of having to mobilize its resources to help others. Nevertheless, many municipalities have at least one mutual aid agreement; as noted earlier, a high percentage – 97.9% – of municipalities have such an agreement, and this percentage represents an increase from 91.2% in April 2011 (FDMA 2017) after the 3.11 disasters.

Second, since the 3.11 disasters, policy makers in municipal governments have become increasingly aware of how important it is to enter into *ex-ante* arrangements, both with neighbors and distant municipalities. While an *ex-ante* arrangement with close neighbors has merit in the sense that geographical proximity allows concerned members to quickly come to the aid of needy members, one lesson learned through the 3.11 disasters is the possibility that all member municipalities can be afflicted, and hence incapacitated and unable to help one another. This lesson has prompted more municipalities to enter into mutual agreements with remote municipalities, i.e., those in other prefectures. As of April 2011, 757 municipalities were engaged in mutual agreements with municipalities in other prefectures, and this number rose to 1,240 by April 2016 (FDMA 2017).

Third, the 3.11 disasters accentuated the need for creative ways to boost manpower, especially during recovery and reconstruction (Aoki 2015a). Under the MIC-JACM-NATV scheme, municipalities nationwide will quickly send sufficient manpower for emergency response, but manpower aid for recovery and reconstruction is, and has been, in short supply. This is because, as the MIC (n.d.) revealed, some municipalities are not able to send help because the types of personnel who can perform the technical work for recovery

and reconstruction are also in short supply in their own jurisdictions. Unlike the aid for emergency response, manpower aid for recovery and reconstruction has to be sustained over the mid- to long-term to secure job continuity and stability, but small municipalities find it difficult to allow personnel to vacate positions for long. To boost manpower aid for reconstruction, the JACM has been requesting municipalities to send former employees and third-sector personnel, too (see, for example, JACM 2016a, b).

Finally, one notable phenomenon is the fact that municipal government officials have been promoting, whether intentionally or unintentionally, a sense of reciprocity between municipalities in their official announcements and media reportage. For instance, when the Kumamoto Earthquakes occurred in April 2016, a number of public servants and politicians in Tohoku municipalities expressed their wish to return a favor they had received in the wake of the 3.11 disasters by sending their staff to Kumamoto municipalities (see, for example, Asahi Newspaper, January 26, 2012; Nikkei Newspaper, April 18, 2016; Onagawa Town Government 2016), even though their own municipalities were still in the process of reconstruction. Such a phenomenon can arguably foster a political environment congenial to inter-local manpower aid in Japan. This is especially so, considering the finding in Aoki (2017) that a former recipient of help from a hypothetical city affected by a large natural disaster tends to be more willing to send their municipal public servants to the city than others who had not received help from this city.

## Conclusion

This chapter surveyed *ex-ante* and *ex-post* inter-municipal manpower aid critical to mitigating risks associated with decentralized disaster management and provided some examples. Although inter-municipal aid is not a new idea in Japan its importance was manifested in the wake of the 3.11 disasters. The challenges faced by the Tohoku municipalities at that time prompted more municipalities to enter into *ex-ante* mutual aid agreements, and with more remote municipalities. The challenges also accentuated the importance of mobilizing manpower for recovery and reconstruction, while a sense of reciprocity seems to drive some appreciative officials to offer a helping hand to needy municipalities.

# Internal Budgetary Auditing

Marco Bisogno
Department of Management and Innovation Systems, University of Salerno, Salerno, Italy

## Synonyms

Budget audit; Internal budgetary audit

## Definition

Internal budgetary auditing is a series of systems, measures, and processes that a public sector entity adopts within the whole internal control system, in order to ensure that public financial management operates in a full compliance with laws, standards, and regulations as well as in an efficient and effective manner.

## Introduction

Budgeting is one of the most popular, detailed and complicated parts of public sector financial management, since it has been considered as a crucial device to control organizations' expenditures.

More specifically, budget of a public sector entity is not only a tool to deploy its strategic plans; it also plays a formal but important role in the political processes, representing the way through which public expenditures are legally authorized. As such, budget is a public matter, with the main implications being its approval by a legislative body as well as its presentation to the general public. In other words, budget publicity is a principle of democracy.

However, this principle is adequately satisfied if publicity is not limited to the presentation of the budget itself, but covers also budget execution, providing a report where adjustments of the initial budget as well as a confrontation between the budget and the actual are illustrated. In turn, this implies, among other things, a need of budgeting control covering budget preparation, execution, and reporting. As such, a peculiarity of the public sector emerges: the auditing of the budget which differs from auditing of financial statements with the main difference being that the former is expected to be less affirmative than the latter, since it is characterized by a larger degree of uncertainty.

Generally, financial planning and financial control should be considered as two separate (but correlated) tasks of public sector financial management, since they refer to distinctive organizational structures. However, even though such a distinction in a way is rationale for several technical reasons, according to Bergman (2009, p. 44), a more adequate and rationale approach consists of bringing together these two tasks under the wide umbrella of the term budgeting.

Figure 1 shows the managerial planning and control processes of a public sector organization (Jones and Pendlebury 2000, p. 21).

In very concise terms, while the first phase concerns the strategic planning, aiming to define the fundamental future objectives of a public sector entity, the second one refers to the planning of operations and actions through which the fundamental objectives can be achieved. These two phases guide the predisposition, approval, and execution of a budget (annual and multiyear budgets), which in turn fuel the control and measuring phase. The analysis and the reporting of the achieved results is the final step, which can suggest budget revisions and/or operation plan revisions. It is useful to observe that budget reporting is a very relevant phase, even though it is often neglected.

The auditing of the budget should be investigated taking into account all these phases, especially phases 2–5 which form the managerial planning and control cycle, merging financial planning and financial control in the sense as mentioned above.

In the European context, Council Directive 2011/85/EU states that public accounting systems of member countries have to be subject to internal control (as well as to independent audits), which would aim to improve confidence of the users (i.e., the parliamentary body as well as the citizens) in the budget. Along this line, it is worth recalling again the idea that internal auditing, as the essential part of the internal control, is expected to provide adequate information about initial budget, its revisions, execution, and reporting, comparing budget with the actual and explaining the results, also taking into account the planned fundamental objectives. More specifically, internal budgetary auditing should include control of procedures, financial control, and the control of effectiveness.

Accordingly, this entry will follow these fundamental steps of budgetary auditing, considering internal budgetary auditing within the whole internal control systems of public sector entities. This implies a preliminary clarification of the role of the internal control, also focusing on some private sector developments having implications for public sector entities.

## The Role of the Internal Control

Staff and management involved in the preparation of the budget have full access to IT systems and, consequently, to the information they provide, with a potential risk of overstating positive information and hiding negative facts and figures. This means that staff and management have a strong information advantage over the parliamentary

**Internal Budgetary Auditing, Fig. 1** The managerial planning and control processes of a public sector organization

body approving the budget as well as over the general public.

The essential role of the internal control system is to reduce this information asymmetry; therefore, internal auditors play a crucial role, having to reveal any highly material misconceptions.

Information asymmetry and the attempt of reducing it are a matter of exercising power within organizations, whose relevance in the public sector context has been historically taken into consideration, as in the Max Weber's bureaucracy model.

Literature distinguishes two internal control approaches.

The first one is the so-called Napoleonic approach, according to which information asymmetries should be reduced through a shared responsibility derived by an ex ante approval of each transaction process. This means that bodies (line entities such as departments, agencies, line ministries, and so forth) having responsibility for managing funds regarding this transaction must firstly receive a formal approval from financial controllers. As a consequence, line entities provide all the relevant information about the transaction so that financial controllers would approve it, with the main benefits being that on one hand, compliance improves and, on the other, misconducts are more difficult and less likely to occur. However, this approach is time-consuming and would imply an unclear responsibility in the case of wrongdoing.

The second approach is the so-called Nordic school, where information asymmetries are addressed by focusing on managerial accountability and responsibility. The Nordic approach is more devolved than the Napoleonic school, since line unit managers are held responsible for each decision, transaction, and consequent results, even when they have themselves delegated the responsibility. Additionally, the Nordic approach is more consistent than the Napoleonic school with the New Public Management philosophy, since it is based on devolving financial responsibility rather than having centralized controls (Bandy 2015). This enhances the role of the internal control and the internal audit systems.

The Napoleonic approach is adopted in France, Belgium, and southern European countries (such as Italy, Spain, Greece, and Portugal) as well as in some of their former colonies in Africa and Latin America; on the other hand, the Nordic school can be observed in Anglo-Saxon countries as well as in Scandinavia. Since 2000, the European Commission has endorsed this last approach, as demonstrated by the Public Internal Financial Control (PIFC) initiative, as explained later in this section.

In a broader view, public sector internal control, notwithstanding has a long history, has been recently influenced by the private sector internal control developments, due to the well-known recent corporate scandals (such as Enron, WorldCom, and Parmalat). More specifically, the developments that have had a major impact on public sector internal control and auditing practices are the Sarbanes-Oxley Act (2002) and the so-called COSO framework.

The Sarbanes-Oxley Act, which is a federal law of the USA articulated in 11 Sections, is having a very large influence on internal control systems; even though it refers to public companies, a significant part of its contents are considered applicable to both nonprofit and public sector entities (Jackson and Fogarty 2006). More specifically, Section 404 concerns internal control, asking for managers to regularly provide reports on the internal control structure and procedures, as well as to assess their effectiveness. This means that auditors are expected to provide opinions not only on financial statements but also on the managers' assessment of the internal control; additionally, auditors have to provide their own opinion on the internal control.

The COSO (Committee of Sponsoring Organizations) framework, issued by the Treadway Commission, provides guidance for designing, implementing, and conducting an internal control system, also assessing its effectiveness. It has been considered as one of the possible frameworks to be adopted in order to conform to Section 404 of Sarbanes-Oxley Act. The first step of adopting COSO framework, in both private and public sector entities, consists of defining and implementing policies and procedures. Policies consist of guidelines that managers are expected to follow in dealing with issues such as the use of the IT systems, staff compensation, etc.; procedures consist of detailed instructions on what should be done and who is responsible for it. In the specific case of a public sector entity, Table 1 illustrates a list of policies and procedures.

**Internal Budgetary Auditing, Table 1** Policies and procedures for internal control in a public sector entity

| No. | Policies and procedures |
|---|---|
| 1. | **Budgeting** (i.e., budget preparation, budget authorization, budget adjustment) |
| 2. | **Appropriation/commitment** (i.e., authorization, adjustment, record keeping) |
| 3. | **Account receivables** (i.e., system requiring for invoice processing, payment deadlines, action to be taken to enforce payment, credit card procedures, handling of errors) |
| 4. | **Accounts payable** (i.e., record in system, check for appropriateness, check for errors, authorization and execution of payment, handling of errors) |
| 5. | **Accounting** (i.e., recognition/inventory procedures, measurement/valuation procedures, general ledger procedures, consolidation procedures) |
| 6. | **Human resources** (i.e., hiring procedures, dismissal procedures, new employees orientation, antidiscrimination and harassment policy, use of IT policy, continuous education policy, compensation policy) |
| 7. | **Sales** (i.e., pricing guidelines, discount policy and procedures, refund policy and procedures, anticorruption policy) |
| 8. | **Expenses** (i.e., authorization, travel policy, ticketing procedures, corporate credit cards policy) |
| 9. | **IT/communications** (i.e., encryption procedures, privacy policy, illicit or inappropriate usage policy) |
| 10. | **Facilities** (i.e., energy saving policy, building access procedures, dangerous goods procedures) |
| 11. | **Public relations/media** (i.e., authorization procedures, information policy) |
| 12. | **Corporate governance** (i.e., committees, nomination procedures) |

Source: Bergman (2009), p. 122

In the EU context, the European Commission has adopted the Public Internal Financial Control (PIFC) initiative, pursuing the aim of improving public sector internal financial control of member states, that is to say transparency and accountability as well as fighting corruption. As stated above, PIFC is based on the internal control Nordic school, since it goes further "the traditional system with its emphasis on legality and regularity [which] lacks the criteria of economy, efficiency and effectiveness in relation to managing and controlling public funds" (EU Commission 2006, p. 5). PIFC is based on three pillars:

- *Financial management and control systems*. It refers to managerial accountability on performed activities, operational policies, as well as financial management and control policies. This means that managers are responsible for designing and implementing adequate financial management and control systems. Obviously, the adopted financial control measures should be evaluated in the light of both risk and damage, which in turn should be balanced against the cost of these measures. COSO framework would represent a suitable approach for risk analysis.
- *Independent internal audit systems*. Internal auditors have to assess the internal control systems in place, at the same time highlighting weaknesses as well as providing recommendations for improvement if necessary. They report directly to the top managers, from whom they are independent, since they act in accordance with an internal audit chart, an agreement signed by both managers and auditors.
- *A central harmonization unit* (CHU) for developing methodologies and standards relating to both financial management and control systems as well as internal audit systems. More specifically, taking into account that these last two systems are substantially decentralized, due to the decentralization of responsibilities within large public sector organizations, a central structure is required, in order to improve efficiency and effectiveness. The CHU develops and promotes internal control and audit methodologies on the basis of internationally accepted standards and best practices, also coordinating the implementation of new legislation affecting financial management, control systems, and internal audit.

## The Role of the Internal Budgetary Audit

Having defined the general framework of internal auditing, clarifying that it is one of the key elements of the wider internal control system, this section aims to highlight the main issues related to internal budgetary auditing. More specifically, in accordance with Table 1, it will focus on:

- Budget preparation, authorization, and adjustments
- Budget execution
- Budget reporting

### The Role of the Internal Budgetary Auditing in Budget Preparation and Approval

Budget plays a crucial role both at a managerial level and a political level, since it represents an important device for managers and plays an important role in the political processes (Budding and Grossi 2015). By preparing the budget, managers and line politicians define future expenses and revenues according to future plans, which in turn are expected to comply with the strategic fundamental objectives (see Fig. 1); by approving the budget, the parliamentary body evaluates the specified compliance and authorizes managers and line politicians to spend a predefined sum of money on specific activities and programs.

In several countries, the Supreme Audit Institution (SAI) is in charge of a delicate task, having to audit the budget before it is sent to parliament for approval.

The aim is to assure that budget has been prepared according to both laws and regulations, providing all the required information on the ongoing public expenditures and revenues. Accordingly, budgetary auditors should reveal any high material misconceptions, even though they are supposed to avoid any comments on political decisions. This means that auditors are expected not to overlap their role with that of the parliamentary body, which is in charge of the approval (or rejection) of the budget.

Budget can be prepared in accordance with different perspectives, such as the functional perspective (revenues and expenses are determined for different groups of products, i.e., services delivered to citizens or to other public sector entities), the institutional perspective (focusing on the institution to which budget refers), or by nature (revenues and expenses are classified by their characteristics).

Combining these perspectives, different levels of budgets can be observed. On the lowest level, there is a budget by nature for a specific product, obtaining the so-called product budget; the subsequent level is gained by aggregating several product budgets into groups and then into functions.

The approved budget may be subject to changes during the fiscal year; if this is the case, some adjustments would be implemented. When such adjustments are large and/or affect the higher-level aggregation, certain jurisdictions require the intervention of the auditor.

Several jurisdictions define specific rules concerning the incidence of current expenses on the total ones as well as a strict relationship between current revenues and current expenses. If this is the case, internal budgetary auditors have to control that this rules have been applied and respected both for the initial budget and the final budget.

## The Role of the Internal Budgetary Auditing in Budget Execution

The approval of the budget does not imply an automatic authorization of the transactions it covers. In fact, many countries require another step known as budget execution.

It represents a very important step in the budget cycle, since it implies uses of resources implemented in the approved budget in order to pursue public sector entity's objectives. More specifically, budget execution implies that, after the budget approval, a second formal decision is required. This decision is called appropriation or commitment, which is a future obligation to pay that will be effective when a third party complies with the provision of an order or a contract concerning specific goods or services to be delivered to a public sector entity. When these goods/services are delivered, their conformity with the order or the contract is verified, so that the payments will be disposed.

Even though these issues are particularly relevant in the case of expenses, similar requirements exist also on the revenue side.

Internal budgetary auditing, within the whole internal control system, is expected to check all these aspects, starting with the conformity of transactions on the approved budget.

More specifically, this financial control follows the classic rules of budgetary theory, especially both the unity and the annuality principles.

The unity principle means that expenditures can only take place against the approved budget. The main effect is that off-budget financing is not allowed. Moreover, unity principle implies that all the revenues, including tax revenues, are collected in order to finance the organization's budget as a whole.

The main implication of the annuality principle is that the authorized spending must take place during the fiscal year. This annual reckoning of spending against the budget, in turn, implies that overspending is prohibited so, if there is overspending, some penalties (frequently including budget-holder liabilities) would incur. On the other hand, if there is under-spending, the amount that the budget holder did not spend is lost, meaning that the budget holder cannot create reserves using the unspent amount.

However, it is worth noticing that some significant parts of the budget are not affected by the annuality. As a relevant example, line items concerning employees' expenditures are determined by past contracts, so monthly controls of such expenses are not required.

Internal budgetary auditing and, more broadly, internal control systems also have to control that budget holders use resources according with the line items of the approved budget (the so-called specification principle). To take this principle to an extreme, transfers of resources from a line item to another are not allowed; however, this form of control needs to be applied at a manageable level, meaning that these transfers do not need a formal approval when they concern lite items belonging to the same group of activities or products or that do not involve changes of central political policy. In other words, as anticipated in the previous section, some changes are at the discretion of the

budget holder and they do not need central approval.

In conclusion, budget execution implies for both the internal budgetary auditing and the internal control systems the following controls:

- Authorization procedures for ordering and receiving goods and services
- Authorization procedures for processing and making payments, also claiming eventual related refunds
- Controls on access to financial resources as well as to financial records
- Regular verifications of financial balances as well as financial reconciliations, including bank reconciliations

Nevertheless, internal budgetary auditing should not adopt a mere compliance approach, only evaluating if financial transactions comply or not with laws, regulations, rules, and so forth. Taking into account that the so-called performance audit has been gained growing importance, the internal budgetary auditing should also pay attention on economy, efficiency, and effectiveness. This means that efficient budget execution should not be limited to ensuring that budget implementation will conform with the authorizations granted by law, but it should pay attention also on how efficiently and effectively both the purchase and the use of resources are managed. Moreover, internal auditors should check the way budget has been adapted to relevant changes in the macroeconomic environment and how problems that could arise during the implementation have been resolved.

## The Role of the Internal Budgetary Auditing in Budget Reporting

During the fiscal year, the accounting system in place records all the transactions and, at the end of the same year, a comparison between the budget and the actual, including any adjustments of the initial budget, is required, through budget reporting.

In the public sector, budget reporting is a public matter since the parliamentary body as well as citizens has a legitimate interest in understanding how public resources have been used.

However transactions are recorded, budget reporting is supposed to report on:

- The original authorized budget
- The authorized revised budget
- The comparable actuals

Figure 2 provides a typical example of budget reporting.

| | *Original budget* | *Revised budget* | *Actual* | *Differences between original and actual: under (over)* |
|---|---|---|---|---|
| **Expenditure** | | | | |
| Employees | | | | |
| Transport | | | | |
| Supplies | | | | |
| Interest | | | | |
| ... | | | | |
| **Total** | | | | |
| **Revenues** | | | | |
| Taxes | | | | |
| Grants | | | | |
| Charge for services | | | | |
| ... | | | | |
| **Total** | | | | |

**Internal Budgetary Auditing, Fig. 2** An example of budget reporting

Obviously, both the structure and form of the report are determined by the structure and form of the authorized budget, since the parliamentary body that authorized the budget in a particular structure/form would require the actuals to take the same structure/form. Additionally, the report would be prepared according to the accounting (cash or accrual) basis to which the budget is based on; if a full accrual budgeting and accounting basis are adopted, the report would take the form of an accrual-based operating segment.

One of the main roles of the internal budgetary auditors is to highlight major differences, according to their materiality, in order to give a clear explanation of them.

Materiality is one of the basic audit principles. According to International Standards of Supreme Audit Institutions 100 (INTOSAI 2013), 100, the subject matter (which may be a public sector entity, a specific program or fund, a public policy or defined activities, and, more generally, any financial as well as nonfinancial information concerning these element) is considered material if the decisions of the intended users would be influenced by its knowledge. Determining materiality is not an easy task, depending on the interpretation and professional judgment of the auditors on the users' needs as well as on the context in which it occurs. Materiality may be expressed in both quantitative and qualitative ways, even though it is frequently expressed in terms of value.

## Conclusions

Traditionally, the main objects of internal budgetary auditing and, more broadly, of internal control systems have been (Jones and Pendlebury 2010):

- Safeguarding financial resources against loss due to waste, abuse, mismanagement, errors, fraud, and other irregularities
- Compliancy with laws, regulations, and management directives on financial resources
- Having accurate records of transactions
- Providing reliable financial reports

The main role of internal budgetary auditors is to provide a view, which is independent of that of top management, to be reported to the parliamentary body or, more broadly, to the body which is in charge of governance. Taking into account that internal auditing activities are becoming more and more important due to the impetus of business scandals, internal auditors are supposed to take a risk management approach to internal controls, reporting on potential risks and risk management in governmental organization.

## Synonyms

Forecasting financial statement

## Definition

The internal budgeting is the process leading to the preparation, prior to a definitive period of time, of a financial and quantitative statement of an organization's activities that shows the expected financial performance, financial position, and cash flows disaggregated by area of responsibility. The resulting document provides managers and policy makers with financial information to assist them in taking strategic decisions for which they are responsible.

## Introduction

The internal budgeting is often intended just as the simple process leading to the creation of a forecast balance sheet, but is something more complex and articulated. The internal budgeting is a key component of managing resources effectively and efficiently. It could be viewed as an effective tool for controlling activity and monitoring and managing financial performance as well as achieving required results.

As for the private sector, the public sector organizations must adapt their budgeting processes to reflect their internal and external environments. In particular, public sector internal budgeting will be influenced by a number of internal factors including:

- The proposed income and expenditure of the organizations services
- The revenue consequences of any proposed capital expenditure
- The use of balances and reserves
- Contributions from trading activities and any surpluses or deficits from the collection fund (local authorities only)
- Growth and savings

The choices of public sector bodies could have a significant effect on the national economy as they are normally funded by different forms of taxation. In this way, the aggregation of budgets allows the sector central government to monitor its activities against its plans or targets and take appropriate action to ensure that these are met.

## Differences Between Private and Public Sector

Even if the process of internal budgeting in public sector shares many similarities with the private sector and the boundaries between the two sectors have become less apparent in recent years, as a consequence of externalization, competitive tendering, the development of both internal and external trading activities, and an increasing emphasis on partnerships among both statutory agencies and the private sector, we can still individuate many differences between them (Meyers 1998).

The first one is the fact that, in public sector internal budget preparation, there is a greater focus on the policy development, performance monitoring, and statutory objectives. Indeed, the main objectives of public sector budgeting are:

- Assisting in planning expenditure to meet policy requirements
- Policy implementation and control
- Measuring and monitoring performance
- Determine the total expenditure of the organization and ensure that it is consistent with total revenues (e.g., fixing the rate of local taxation)
- Provide the basis for authorizing expenditure and collection of fees and charges
- Provide the basis for budgetary control

- Satisfaction of statutory requirements

Moreover, as public and private sector organizations operate in different environments, there are different approaches to budget setting that bring to many other differences between the two sectors. In the private sector, the budget process is market driven as the available resources are influenced by market demand and rely on external sales, while in public sector, the resources, funded by taxation, are constrained and controlled by government, with the activity determined politically.

At the same time, in the private sector, the budget is profit oriented, with a single, or limited number of, objective(s) and identifiable and measurable outputs, while the public sector provides a community-oriented budget, with multi-objectives and qualitative outputs.

These key differences will influence the approach which public sector bodies take to budgeting particularly in relation to the need for processes and procedures to be adapted to reflect the external environment in which they operate and translate this into the setting of budget requirements.

## Relationship Between Internal Budgeting and Planning in Public Sector

As already said, in the public sector organizations, there are conflicting policy objectives, each one with different resource implications which may have either capital or revenue consequences. Often public authorities are not only restricted by resource implications but also by the external environment and political context in which they operate. An effective budgeting process should allow all of the financial implications of alternative policy objectives to be assessed, enabling policy makers to appraise them and compare the costs against available resources and at the same time to assess their alternative plans and identify their priorities within their affordable limits.

The budget is a financial/resource representation of corporate objectives and also a plan of action for the period covered, representing a key element of effective strategy planning (Johnson et al. 2008). Moreover, it forms the basis of a controlling mechanism for the various resources of a public entity that could be applied at all managerial levels. The budget can also highlight variations from expectations so that senior management can take remedial action to ensure that expenditure is contained within the budget and remains consistent with corporate objectives and policies.

Long-term or strategic planning in the public sector generally covers a period of 3 years or longer and requires to know which are the real objectives of future operations of the organization, as its primary purposes are to help the entity to:

- Establish key priorities for core services
- Individuate which organizational change could respond to the new needs of the public entity
- Forecast changes in population, demographics, or employment opportunities which may impact on the demand for services
- Look beyond the actual strategic path to have new opportunities of choice

It's important to underline that for each objective there should be a clear statement of policy, levels of need with assessments of potential shortfalls, and existing inputs in terms of capital revenue and human resources.

In public sector medium-term plans, generally covering a period of about 3 years, tend to be tactical in nature and provide more detail on the policies and projects required to achieve the strategic aims of an organization.

The main purposes of medium-term budgets of public entities are:

- To show the impact of existing financial commitments on future service provision
- To enable priorities to emerge in case of limited resources

- To reflect the continuing burden of service provision and policy changes
- To review the way at which different services can be developed
- To forecast taxes and charges so that decision makers can indicate (political) acceptability

The short-term planning is totally referred to the organization's annual budget, and there are several key stages in the budgeting process of a public entity:

- Communicating details of budget policies and guidelines to those responsible for preparing budgets
- Determining those factors which restrict outputs or limit expenditure
- Preparation of the budget for key frontline services linked to assumptions on client numbers and intensity of use
- Initial preparation of budgets for support costs and administrative functions
- Negotiation of budgets with politicians, committee/board members, and senior officers
- Coordination and review of budget
- Approval of budgets
- Ongoing review of budgets

Long-term planning is concerned with translating the strategy of the organization into realistic resource plans. The budget identifies the implementation of the approved activities within the long-term plan over the short term. The budget translates the long-term plans and the capital budget into an operating plan.

In most cases when the annual budget is prepared, most of the decisions that affect that financial year will have already been prepared. Therefore, the budget is not something which is generated from scratch but is developed within the context of the ongoing business.

The figure below outlines a simplified process for linking long-term planning with annual budgeting and their joint roles within the planning and control process.

## Linkage Between Long-Term Planning and Budgeting

### Integrating Budget and Medium-Term Planning in Public Sector

The link between long-term planning and budgeting comprehends a process of integration of the former one with the medium-term planning that will pass along five steps.

The first step will regard the forecasting of resources and commitments. For the resources the preparers should develop a mechanism to predict future levels of aggregate external financing which takes into account all known and assumed factor, think about levels and movements in balances and reserves, and consider the revenue

implications of the new system for prudential indicators to determine local authority borrowing. In identifying future commitments, it is desirable that any known material changes are allowed for, assumptions are made regarding future price movements, and the effects of government spending priorities are considered.

The second step will regard the corporate plans that should assist in the establishment of clear service priorities at the start of the budget setting process. In order to have a strong link between long-term planning and budgeting, the plan should separate long-term aspirations from those achievable in the short term, identify key priorities and aims of the organization, demonstrate the financial consequences, and have as main outputs measurable targets that are implementable.

Once completed the output of second step, the next step, the third one, will be about aligning budgeting and planning. In these circumstances, organizations should concentrate on financial analyses of major policy initiatives and significant shifts in service provision rather than attempting to cost the full service plan. Traditionally many local authorities have had no formal consideration or guidelines before detailed budgeting starts, and the entire process was concentrated into a few months. Corporate planning aligns the timetable for the preparation of service plans and budgets and is also critical in linking the two processes.

The fourth step will consist in the budgeting process itself, in which we should consider a number of issues:

- Budget format (should the budget be fixed for a 3-year period or subject to annual review?)
- Level of detail (should 2- and 3-year budgets be prepared at a summarized or detailed level?)
- Flexibility between years (any medium-term budget is likely to include a system of internal budget flexibility which allows carry-forwards of underspends to future years)
- Budget drivers (there are a number of key areas which drive budgets and will impact on any plan, e.g., revenue or capital implications of best value reviews, government priorities and the impact of changes in the local government finance distribution system, etc.)

At the end of the process, as fifth step, will be needed an assessment of performance that, compared with planned actions and targets, will highlight issues that need to be addressed in future plans and budgets.

To make this achievable, the initial plans and targets must be measurable and achievable; the confrontation of achieved results against targets must be made on a timely basis; the document must provide a clear indication of further actions required to address poor performance.

## Internal Budget Process in Public Sector

Developing and implementing an internal budget is a complex issue for any public entity, as it generally involves a significant amount of people and time and typically spans many months. The full process will require:

(a) Planning and coordination
(b) Budget construction
(c) Rigorous quality assurance processes and structured communication

(a) The responsibility for planning and coordination of internal budget processes usually resides in the finance area (specifically the Chief Financial Officer), supported in this role by a designated budget unit and a team of budget coordinators located throughout the organization's operational areas. Their duties generally will include:
    - Developing budget timetables
    - Developing the key planning assumptions
    - Issuing guidelines and instructions on budget preparation
    - Advising and assisting the other organization's units to develop budgets
    - Undertaking quality assurance checking of estimates and requests submitted by line areas
    - Providing technical advice and guidance to senior management
    - Monitoring progress on budget development

- Preparing estimates that are not captured at group level
- Preparing budget documentation
- Reviewing budget processes

The elements of effective planning and coordination include:

- Setting budget policies
- Establishing budget timetables and milestones
- Allocating responsibility for budget preparation and review
- Documenting budget processes and communicating guidelines

*Set budget policies*

As seen in the previous paragraph, integrating planning and budgeting requires that the internal budget be consistent with the organization's strategic and operational plans. In this way, a documented budget policy is a useful mechanism to articulate budget priorities and constraints and communicate the organization's framework for budget development and decision-making.

It is important that these policies provide sufficient information for line areas to develop plans and budgets that align with the organization's strategic directions and priorities. Collaborative target setting approaches involve line management in establishing organizational objectives, priorities, and strategy. Interaction with external stakeholders (including ministers and central agencies) is also important to identify their needs, priorities, and insights for incorporation into budget planning.

*Establish budget timetables and milestones*

Normally in public sector, developing the internal budget takes a number of months. In order to ensure that deadlines are met and resourcing conflicts are managed, many public entities develop a comprehensive and integrated planning calendar. Ideally, these calendars should:

- Identify specific information required for internal budget processes
- Describe deliverables in detail
- Incorporate key checkpoints
- Factor in other relevant deadlines, in particular those relating to the external budget and reporting
- Highlight relevant internal and external budget milestones

*Individuate responsibility for budget development*

The involvement of many areas and individuals in the process of internal budgeting needs to clearly assign and communicate responsibilities for budget planning, coordination, and development at the beginning of each process. As the preparation of internal budget requires intensive workload, it is important that organizations establish arrangements to cater for contingencies such as the unavailability of key personnel during the budget process. This is particularly important in small organizations, which are heavily dependent upon the knowledge and skills of a small number of individuals.

*Document budget processes and guidelines*

An effective communication, clear and understandable, is essential in the budget process: from preparation through review, it is critical that key budget assumptions are shared and applied consistently. The budget guidelines must be communicated to participating managers and stakeholders at the commencement of each internal budget process to help ensure a consistent and timely approach to budget development. In public entities these guidelines are generally communicated in written format, but could be acceptable any other medium suitable for the efficient and effective dissemination of information (e.g., through information sessions). It is important that budget guidelines are sufficiently detailed to address an organization's financial and operating conditions for the given budget period.

It is also important that during the internal budget process, organizations provide clarity of role responsibilities and tasks at each stage of the process, through documentation techniques such as process mapping and responsibility maps. However, documenting budget processes and responsibilities also helps to identify resourcing gaps and potential bottlenecks in the process as

well as to inform each stakeholder in the budget process of the nature of their responsibilities.

(b) An effective budget construction is influenced by many factors, such as the predictability of entity operations, the extent of change required, and the time and resources available to complete the process. Key considerations in constructing internal budgets include:
   - The direction of the budgeting process (top-down direction or built from bottom-up participation).
   - The budget is derived incrementally from previous budgets.
   - The budget processes are automated.

*Budget top-down, bottom-up, or both*

Though the internal budget may be constructed "top-down," if the strategic planning process drives development of the budget, or "bottom-up," where the budget "rolls up" from operating units and staff preparing it, most organizations adopt a hybrid of the two approaches where senior management set broad objectives and constraints and operational managers are involved in the allocation of resources within these objectives and constraints.

This approach is generally preferred as:

- The contribution of all levels of management to the process implies a greater commitment to the budget setting process.
- The definition of strategic targets and constraints by the top manager brings to a broad, organization-wide perspective consistent with government priorities.
- It leads to a greater understanding of how the actions and demands of individual areas impact the organization as a whole.
- The responsible for delivering the services are those that construct the detailed budget.

However, an ineffective hybrid approach can result in significant amounts of time and effort being spent in negotiation and iteration, with senior management ultimately having to impose budget cuts to satisfy organizational constraints.

There are circumstances where a largely bottom-up budgeting approach might be appropriate to an organization. This is true in particular when an organization has undergone substantial change and a bottom-up approach is useful in setting the budget baseline, especially if these changes happen year to year, for example, in project-based organizations.

On the other hand, a primarily top-down budgeting approach is the most appropriate in some circumstances, for example, where an organization has to identify substantial budget savings in a short space of time or in circumstances where additional budget discipline is needed (Flynn 2007).

*Determining the budget approach*

Most organizations prepare budgets using one or a combination of the following methods:

- Incremental budgeting (otherwise referred to as traditional budgeting)
- Zero-based budgeting
- Activity-based budgeting
- Performance-based budgeting

In the incremental or traditional budgeting, the previous year's budget provides a baseline for the current year, adjusted for the removal or addition of one-off budget impacts. The main advantages of this method are its simplicity and easy understandability, as well as the possibility for the managers to have a stable and consistent approach to budgeting. At the same time, its advantages regard mainly the assumption of unchanging activities from the last year and the difficulty to identify savings and efficiencies.

The zero-based budgeting requires preparation of the next year's budget as if it was a new, rather than continuing, budget, with every aspect that must be justified. This method endeavors to redirect efforts and funds from lower priority current programs to higher priority new programs, improves efficiency and effectiveness, and therefore reduces spending. It implies a greater alignment of resource allocation to output and program delivery, an active involvement of operational managers and a focus on value for money as each budgeted amount must be justified. On the

other hand, there is an increased complexity, requiring greater time and cost to deliver budget, and if the organization's activities experience little fluctuation, the needed workload may not be justifiable.

The activity-based budgeting concentrates on factors that drive costs and justifies expenditure on the basis of activities performed in relation to predetermined drivers and places responsibility on the manager with responsibility for the driver. The main advantages of this method are the opportunities to examine work practices and eliminate non value-adding activities, a close linkage to operational planning and the chance for managers to analyze budgets in operational terms. Its high complexity could give to the manager some problem in understand what activities drive their budget and estimate activity volume.

In the performance-based budgeting, the process begins with an assessment of what the organization is trying to achieve. The activities required to achieve each output are identified and costed. This approach presents some advantages as:

- The linkage between resources (inputs) and the organization's deliverables (outputs)
- The strong integration of budget and strategic and operational plans
- The alignment of budget to source of appropriation funding

But at the same time, there are also some very important disadvantages to consider:

- Its greater complexity, with the greater time and effort involved in collecting output and program indicators
- The risk that budgets could be ineffective if performance measures are not clearly articulated

Theoretically, a budgeting approach following zero-based budgeting or performance-based budgeting would generally be considered better practice as the budget links to the organization's goals, priorities, and outputs. However, given the complexity, time, and cost associated with these methods, they are not practicable for all organizations. This is particularly the case for organizations that exhibit little change year to year where the cost is unlikely to be justified.

*Automate internal budget processes*

Systems and tools used by organizations to construct the internal budget can have a significant impact on the timeliness and quality of the internal budget. Larger organizations with a mature budget function often use integrated software tools to manage internal budget processes. Sophisticated tools facilitate the development of the internal budget and provide timely financial and management information throughout the organization. Nonetheless, the use of spreadsheets for all or some internal budget processes remains common. However, as a budgeting tool, the spreadsheet has a number of limitations around data integrity, integration, change control, multi-user access, and size restrictions. Further, the use of spreadsheets can have a significant hidden cost through time spent on activities such as maintaining and updating models and the manual consolidation of budget submissions.

To facilitate the production of timely and consistent budgets, organizations should limit the amount of manual intervention. It is essential that internal budget system and tools are reevaluated on a periodic basis (e.g., every 3 years) so that they remain appropriate to the efficient and effective development of the internal budget.

(c) The communication process in the budgeting is a critical element, particularly for the involvement and commitment of senior management that has a key role in developing an effective internal budget. To involve senior management could be created a budget committee to oversight the internal budget process. The functions of a budget committee include:

- Developing budget strategies and priorities
- Approving timetables and allocation of responsibilities
- Approving budget guidelines

- Providing policy advice and strategic analysis to the Chief Executive
- Evaluating budget bids, including alignment with the organization's priorities
- Recommending final approved budgets
- Conducting ongoing assessments of budget processes

As mentioned, the primary responsibility for coordinating the budget process typically resides in the finance area and particularly in the Chief Financial Officer (CFO). Assuming this, the authority of CFO is essential to ensure that budget guidelines and policies are being complied with throughout the organization.

The organizational and area budgets need to be subjected to quality assurance review before being submitted to senior management in order to allow them to focus on priorities and trade-offs rather than data quality. Quality assurance is generally performed by the finance area, but may also involve internal audit or specialist assistance, especially for new or complex budget initiatives.

After the submission of single budget by the different line areas, the part of the process involving them is not concluded as changes are required at the organizational level once budgets are consolidated to accommodate resource constraints or evolving priorities, and it is important that managers have been consulted and understand why changes have been made. Collaboration and trust between areas involved in the budget setting process are really important. At the same time, making internal budgets available as soon as practicable after approval enables managers to take timely action to achieve budget targets.

To communicate the internal budget to all relevant stakeholders, organizations can prepare a summary of the budget that should include an overview of key financial goals, initiatives, and financial results by budget allocation, using charts and graphs to better illustrate important points.

## Synonyms

Management controls

## Definition

Internal controls are organizational inherent mechanisms, which allow the normal business processes find in themselves the persistence conditions in accordance with sound management standards.

## Introduction

In the last 30 years, the New Public Management (NPM) movement has inspired the renovation processes of public administrations all over the world, (Barzelay 2001). Its watchwords – efficiency, economy, accountability – together with the expectation that it could be an effective way to reduce public spending can be regarded, at large, among the reasons for its success. In particular, given that the NPM promotes the introduction of the accrual concept in public budgeting and

accounting, together with the re-orientation of budgeting systems from inputs to results, the need to re-shape internal control and audit systems becomes apparent (Sterck et al. 2005). In this respect Power (1997) argues that NPM is among the causes of the "audit explosion," that is, to say the proliferation of auditing activities and especially value for money (VFM) audits or performance audits. Bowerman et al. (2000) dispute the fact that the audit explosion is just an element of a wider phenomenon that they refer to as a "performance-measurement society." In this context, an "internal control explosion" (Maijoor 2000) also takes place.

The development of an effective internal control system – hereinafter ICS – is in fact a keystone for public sector governance, together with the implementation of the aforementioned accounting and budgeting practices. ICSs assist public organizations in the pursuit of a more accountable and transparent, thus less corrupted, administration.

## Internal Control Models

Internal controls are organizational inherent mechanisms, which allow the normal business processes find in themselves the persistence conditions in accordance with sound management standards. As Maijoor (2000) argues, while traditionally internal controls were mainly related to the accounting controls and represented by measures such as segregation of duties, authorizations, and so on, currently the concept of internal control has been expanded to cover many other types of activities.

As for the public sector, in particular, although there is a variety of ways in which internal controls are intended across different countries, a widely accepted definition is the one adopted by the International Organization of Supreme Audit Institutions (INTOSAI) which recalls the one provided by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). As defined by INTOSAI (2004, p. 6), internal control is:

> an integral process that is effected by an entity's management and personnel and is designed to address risks and to provide reasonable assurance that in pursuit of the entity's mission, the following general objectives are being achieved: 1) executing orderly, ethical, economical, efficient, and effective operations; 2) fulfilling accountability obligations; 3) complying with applicable laws and regulations; 4) safeguarding resources against loss, misuse, and damage.

Thus, according to this definition, and coherent with the more general one provided at the beginning of this section, internal controls appear as organizational mechanisms necessary to effectively and efficiently accomplish an entity's mission.

The ICS is aimed at the assessment of risks and continuously interact with the accounting system and the internal audit in order to achieve the general objectives that are functional to the entity's mission (Fig. 1).

These internal control mechanisms have to be devised so as to be integrated with all the other processes being carried out and built into the entity's infrastructure, rather than being considered as a separate apparatus from the existing structure and procedures. The integration of the internal controls into the basic operating activities requires the management to carefully consider how the existing operations can contribute to the ICS. This management effort helps prevent unnecessary procedures, which may delay operations and result in additional costs.

Managers and entity's personnel at large are what make the ICS work. Managers not only have to design internal controls, but they also have to implement them and supervise their implementation. For internal controls to be effective, it is necessary that all the personnel in the organization are well aware about their roles and responsibilities, and this makes communication another essential feature for the internal controls successful operation. According to the INTOSAI framework, the subjects involved in the ICS can be classified in internal and external stakeholders. The former are represented by the previously mentioned managers and entity's personnel, as well as by the internal auditors, who assess the

**Internal Control Models, Fig. 1** Interaction among the ICS, the accounting system, and the internal audit. (Source: Adapted from Pavan and Fadda 2013, p. 436)

ICS and provide recommendations for its improvement. External stakeholders, instead, are not responsible for the implementation of the internal controls; however, they can contribute to the achievement of the organizational objectives. They are represented by the external auditors and Supreme Audit Institutions (SAIs), legislators, and regulators, as well as other parties that interact with the organization, for example, beneficiaries, financers, and provide information about the achievement of its objectives. As for external auditors and SAIs, they assess the ICS and report their findings and recommendations to the management and to other interested stakeholders. Legislators and regulators, instead, can provide rules or policies concerning internal controls allowing a better understanding about what they are meant to be.

Furthermore, other two elements stand out from the INTOSAI definition that need to be addressed: one is related to the risk assessment mission of internal controls, and the other is related to the provision of a reasonable assurance about the attainment of the entity's objectives. These two elements are noticeably strictly related and they point out that the existence of an ICS cannot guarantee the achievement of the organizational objectives, but rather that it can only provide a satisfactory level of confidence, under specified conditions concerning costs and benefits, about the objectives' attainment. This implies, on the management side, a careful evaluation of the costs and the benefits that the system will generate, as costs should not exceed the benefits. The implementation of the internal controls implies explicit costs – the resources necessary for accomplishing the different tasks required by the system – as well as implicit costs such as operations delay or employee low morale. On the other hand, benefits are measured in terms of the extent to which the risk of not succeeding in the attainment of the stated objectives is reduced. Managers, thus, have to make their decisions about internal controls being well aware about the significance of the objectives to achieve, and the financial and nonfinancial implications related to their failed attainment.

It is useful here to emphasize that the INTOSAI's definition is slightly different from the original one provided by the COSO with regards to the general objectives to be achieved. In fact, while the COSO framework provides for three categories of objectives – operations, compliance, and reporting – the INTOSAI model accounts for an additional category which is related to the safeguarding of an entity's assets. The COSO framework considers safeguarding corporate resources implicit in the operations objectives, whereas the INTOSAI considers the safeguarding of an entity's assets a goal in itself, which assumes relevance because they are financed through public money. Furthermore, while the COSO framework, with reference to the operations objectives, only takes into account economy, effectiveness, and efficiency aspects, the INTOSAI model also emphasizes the ethical aspect, because of its importance in the context of the fight against fraud and corruption in the public administration.

The INTOSAI control model consists of five interrelated components which represent what is needed to achieve the general objectives (INTOSAI 2004):

1. Control environment. It represents the base onto which the ICS is built as it provides discipline and structure as well as the climate which influences the overall quality of internal controls. Among its core elements, the INTOSAI stresses (INTOSAI 2004, pp. 17–21): (a) management and staff personal and professional integrity, ethical values, as well as a supportive attitude toward internal controls; (b) management and staff commitment to competence which means making sure that everyone throughout the organization possesses the necessary skill to assess risks and to accomplish the general objectives; (c) the "tone at the top" which requires top managers to demonstrate a supportive attitude towards the internal controls so that everyone in the organization understands their importance thus allowing the establishment of a positive control environment; (d) the organizational structure which must define clearly authority and responsibility. Depending on the roles and responsibilities identified, accountability duties have to be set which in turn requires adequate forms of reporting; (e) human resource policies and practices which are essential for setting a positive control environment. As the ICS is effected by people, the organization must make sure that the right persons are hired and then adequately trained, compensated, evaluated, and motivated in order to maintain a positive control environment. This requires making sure that individuals not only have the adequate skills, but also the integrity necessary to perform their jobs, and continuously providing ethics training.
2. Risk assessment. As the function of the ICS is to provide reasonable assurance about the achievement of an entity's goals, the entity must be aware of the risks it has to face and how to cope with them. The risk assessment should be an ongoing iterative process which implies identifying and analyzing relevant risks and determining adequate responses. This process plays a key role in the selection of the appropriate control activities to be undertaken.
3. Control activities. They include all the policies and procedures aimed at verifying if all necessary actions to achieve the entity's goals are effectively carried out. They occur throughout the organization, at all levels and in all functions, and include a range of activities as diverse as for example: authorization and approval procedures, reconciliations, reviews of operations, processes and activities, and reviews of operating performance. Risk assessment and control activities together constitute what is called the risk management process which is the overall process that starts with risk identification and terminates with the implementation of the necessary controls in order to reduce identified risks to an acceptable level.
4. Information and communication. They play a key role in ICSs as they produce reports, including operational, financial, and compliance-related information that allow public accountability obligations to be fulfilled. This objective can be achieved by developing and

maintaining reliable and relevant financial and nonfinancial information and communicating this information by means of a fair disclosure in timely reports. A precondition for reliable and relevant information is the prompt recording and proper classification of transactions and events. The management's ability to make appropriate decisions is affected by the quality of information that has to be appropriate, timely, current, accurate, and accessible. Information is the basis for communication which has to enable all personnel to carry out their control responsibilities effectively. Useful communication should occur in all directions, flowing down, across, and up the entity, throughout the entire structure.

5. Monitoring activities. They include all activities aimed at assessing the effectiveness of the ICS. Monitoring is accomplished through ordinary activities performed on a regular basis or separate evaluations carried out on the basis of ongoing activities' results. Internal control deficiencies detected through these monitoring activities should be reported upstream, and corrective actions should be taken to ensure continuous improvement of the system.
6. These five components of the ICS according to the INTOSAI also represent the basis against which an ICS can be evaluated. They are all necessary to achieve the four general objectives, and each component is relevant for each objective individually considered.

## Conclusions

As stated above, there is a variety of ways in which public internal controls are intended and implemented across different countries. Despite these differences, it is worth mentioning before concluding that common trends have been observed. A first convergence path has led many OECD countries to shift the emphasis of controls from ex-ante controls to ex-post ones leading to the strengthening of the same ICS. Furthermore, while traditionally internal controls were almost only financial controls, starting from the 1990s a number of different factors have led to a constant proliferation of other types of control that go beyond the mere financial perspective, although the former ones are still prevailing (Ruffner and Sevilla 2004, pp. 124, 130). Increased government complexity, technological advances, focus on performance are among the factors that have prompted these changes.

In the attempt to classify the different public internal control models, the European Commission (EC) distinguishes between centralized and decentralized systems (European Commission 2014). According to the EC's report, an internal control model is defined as centralized when it encompasses "*the entire control system within the public administration and the sum of all institutions involved in controlling public funds*" (European Commission 2014, p. 13). Italy and Spain are among the countries which adopt such a control model. On the contrary, the same report defines as decentralized those models which are consistent with the INTOSAI control model; Denmark, Sweden, and UK are among the countries adopting this latter type of model.

Despite the multiplicity of internal control models, it is possible to argue that the one developed adapting from and according to the COSO framework represents a state-of-the-art model for public internal controls. This is testified, on the one hand, by the relevance of the organizations sponsoring the COSO activity, for example, the American Accounting Association (AAA); the American Institute of Certified Public Accountants (AICPA); Financial Executives International (EIF); the Institute of Management Accountants (IMA); and the Institute of Internal Auditors (IIA). On the other hand, it is evidenced by the international recognition of the framework as a quality standard for internal controls. The COSO model is, in fact, the most widely used framework by listed companies in the USA to comply with Sarbanes-Oxley Act (SOX) on internal controls.

# International Development Agencies and Developing Countries

Komla Dzigbede and Rubayat Jesmin
Department of Public Administration,
Binghamton University, Binghamton, NY, USA

## Synonyms

International development aid; International development assistance; International development cooperation; International development intervention; International development partnership

## Definitions

International development is an active process of engagement between nations by which developed countries extend critical economic, financial, and technical resources to developing nations to reduce poverty and inequality and improve health, education, and employment opportunities in developing regions. International development agency refers to the coordinating department or unit in a developed country that oversees the country's international development program in developing countries.

## Introduction

International development agencies play an important role in reducing the wealth gap between developed and developing nations. They extend technical and financial resources from developed country governments to developing nations and work with civil society organizations and local communities in developing countries to provide resources in critical sectors and promote development at the micro-, meso-, and macro-levels. Developed countries distribute international development assistance through multilateral international organizations (e.g., the World Bank) and international development agencies (e.g., US Agency for International Development).

Among the top donors in international development assistance are the United States, the United Kingdom, Japan, Germany, France, and Canada. Between 2011 and 2015, these countries together contributed $102.5 billion in development funding, compared to 756.7 billion contributed by all donor countries. Additionally, the top five recipients of international development funding are Afghanistan, Syria, Vietnam, Ethiopia, and Egypt; these countries received development assistance amounting to $100.3 billion between 2012 and 2016, representing 13.3% of total funding to low- and middle-income countries (Organization for Economic Cooperation and Development 2019).

This essay explores the main priorities and achievements of international development agencies in developing countries. It also discusses critical challenges in international development and describes specific ways international development agencies can build effective partnerships

with developing nations to promote sustainable development. The discussion focuses on two international development agencies, namely the US Agency for International Development (USAID) and the United Kingdom Department for International Development (DFID).

## Major Priorities

USAID and DFID programs focus on key sectors such as agriculture, health, and education and extend to democracy and good governance, disaster relief, and trade and private sector development. Agency interventions consider that forward and backward linkages in specific sectors can enhance the impacts of programs on households, communities, and the macroeconomy in developing countries.

### USAID

The US government, under the Foreign Assistance Act of 1961, established USAID to administer international development and humanitarian efforts worldwide and promote America's good among foreign countries. USAID's major areas of focus in development assistance are agriculture and food security, democracy, human rights and governance, economic growth and trade, education, environment and climate change, gender equality and women's empowerment, health, water and sanitation, and crisis and conflict management. Table 1 shows the distribution of USAID funding among these program areas in 2017.

**International Development Agencies and Developing Countries, Table 1** USAID funding in priority sectors (2017)

| Program area | Amount (million dollars) | Share of total (%) |
|---|---|---|
| Economic growth (including agriculture) | 3781.8 | 29.0 |
| Humanitarian assistance | 3003.4 | 23.0 |
| Health | 1943.1 | 14.9 |
| Democracy, human rights, and governance | 1345.4 | 10.3 |
| Education and social services | 1327.9 | 10.2 |
| Program development and oversight | 1051.2 | 8.1 |
| Peace and security | 605.8 | 4.6 |

Source: USAID (2018)

### DFID

The United Kingdom established DFID in 1997 as a ministerial department to take the lead in the government's work of tackling the global challenges of poverty and disease, conflict and insecurity, and mass migration. The agency's mandate is supported by several legislations, including the International Development Act (2002) and the International Development Reporting and Transparency Act (2006). DFID's work in developing countries focuses on agriculture, education, environment, government and civil society, humanitarian aid, and industry. Table 2 lists the amount of funding to each program area in 2017.

**International Development Agencies and Developing Countries, Table 2** DFID funding in priority sectors (2017)

| Program area | Amount (million euros) | Share of total (%) |
|---|---|---|
| Humanitarian aid | 1,454 | 16.5 |
| Health | 1,293 | 14.7 |
| Government and civil society | 1,164 | 13.2 |
| Multisector or cross-cutting | 1,190 | 13.5 |
| Education | 785 | 8.9 |
| Economic infrastructure and services | 773 | 8.8 |
| Production sectors | 713 | 8.1 |
| Administrative costs of donors | 543 | 6.2 |
| Refugees in donor countries | 378 | 4.3 |
| Other social infrastructure and services | 236 | 2.7 |
| Water supply and sanitation | 177 | 2.0 |
| Miscellaneous | 98 | 1.1 |

## Recent Achievements

Agency records show that USAID contributed significantly toward the sustainable development goals of all 142 countries in its global outreach in 2017. It achieved impacts across many sectors, including agriculture, conflict, peace and security, disaster prevention, preparedness and response, education, health, infrastructure, and environment (USAID 2018). Agricultural sector programs produced tangible benefits for farmer households and communities. Under the Feed the Future global food security program, the area of land under improved technologies reached 6.2 million hectares, and the number of farmers who applied improved technologies or management practices totaled 10.9 million. Also, many communities benefitted from expanded markets and trade as the value of agricultural and rural loans grew to $623.7 million and smallholder incremental sales amounted to $906.1 million. Overall, 8.2 million households benefitted directly from the Feed the Future program.

In the health sector, USAID established 2743 health facilities with the capacity to manage acute undernutrition. It reached 27.6 million children under 5 years with nutrition programs and 4.9 million pregnant women with nutrition-specific interventions. Additionally, 1.6 million individuals gained access to safely managed sanitation services and 2.5 million people obtained access to basic drinking water services.

The educational sector achieved impacts at both the basic and post-secondary levels. USAID interventions resulted in 23 million learners enrolling in primary schools and equivalent non-school based settings, and 19 million learners received primary-level reading interventions. Children in primary grades that achieved improved reading skills as a result of primary education interventions totaled 828,000. Further, the agency built or repaired 354 primary or secondary classrooms, developed the capacity of 267 tertiary education institutions, and developed workforce development programs that resulted in 53,000 people receiving new or better employment.

Similarly, DFID reports show that the agency's programs in developing countries resulted in 28.7 million children immunized and 475,000 lives saved between 2015 and 2016. The number of children under the age of 5, women of childbearing age, and adolescent girls the agency reached with nutrition-related programs totaled 26.3 million. The agency also supported 27.2 million individuals to gain access to clean water and better sanitation services, and through its primary education intervention programs, a total of 7.1 million children gained decent education (DFID 2018).

Additionally, as part of its strategic priority to strengthen global peace, security and governance, DFID supported 30 countries to manage their public finances, including natural resources and extractives, more transparently. It supported freer and fairer elections in 13 countries and empowered 81.1 million people, including 31.0 million women, to have choice and control over their own development and hold decisionmakers accountable in governance. The agency also enabled ten million women to access justice through the courts as well as gain improved access to police and legal assistance in matters related to domestic violence and abuse, land ownership, and family inheritance.

DFID also strengthened resilience and response to crises worldwide as it reached 17 million individuals, including 7.3 million women and girls, with humanitarian assistance. It provided timely assistance to people dealing with the consequences of armed conflicts, famines, floods, and typhoons in countries like Afghanistan, Ethiopia, Malawi, Pakistan, Somalia, Syria, and Yemen. Also, it responded effectively, alongside other international development agencies, to contain the Ebola crisis in West Africa.

## Critical Challenges

Academic scholars and development practitioners alike have highlighted multiple challenges and concerns about the work of international development agencies in developing countries. These challenges span politics, economics, and public management.

### Politics

Donor allocation of resources is sometimes driven more by political considerations and at the expense of real need for funds in developing countries. It has been argued that national security and commercial interests of donor countries sometimes take priority in resource allocation, and with the growth in terrorism worldwide, some donors tend to channel resources mainly to poor nations that align with political and ideological interests of donors (Gill and Law 1989; Addison et al. 2015). Another concern is the use of international development assistance as a mechanism for gathering information about recipient countries, which undermines the strategic interests of recipient countries at the global level (Amsden 2007). Moreover, in many instances, bilateral assistance packages are delivered to developing countries without much political awareness that these countries are diverse in geography, history, culture, resources, government, population size, and economic structure and that what works in one country might not work in another jurisdiction.

### Economic and Institutional Problems

Corruption is a problem in international development. It is driven by both demand and supply side causes. At the demand side, most developing countries lack adequate regulatory and institutional control systems to ensure transparency of rules and contracts, enforce effective penalty systems, and ensure swift judicial processes (Mele 2014). These institutional weaknesses create incentives for local contractors and consultants to pay bribes to government officials for contracts, and in some instances, contractors inflate the costs of development projects and submit bills for substandard work (Quibria 2017).

Donors contribute to corruption from the supply side. When seeking lucrative procurement contracts, some big corporations in donor countries, operating under a vast network and camouflage of subsidiaries, affiliates, and advisers, engage in corrupt and unethical practices, including making questionable and illegal payments to government officials and political parties in developing countries, and compromise laws and international treaties (Sikka and Lehman 2015).

Aside from the problems of corruption, international development assistance often lacks supporting and coordinating investment in the public and private sectors, and this poses a severe economic challenge that hinders growth and development (Amsden 2007). Food monetization is also a problem. Donor countries' sale of food aid commodities in local markets to generate funds for international agricultural assistance harms local producers as it decreases prices and disrupts local markets (Barrett and Maxwell 2005).

### Program and Project Management

International development programs and projects sometimes lack proper alignment with the policy priorities of recipient countries. Advocates have argued for international agencies to synchronize better their programs and projects with local preferences and utilize longer commitment horizons that embed the longer-term development priorities in recipient countries (Rogerson 2005). Experts have also argued for programs and projects to have the national branding of recipient countries, which is an important expression of soft power and is needed to assert local norms and promote recipient countries as partners of choice (Pamment 2018).

Another challenge is that programs and projects make minimal use of country financial systems and local actors and, in most cases, the reach and effectiveness of projects could be improved. A recent study of USAID agricultural projects in Ethiopia, Ghana, Haiti, Senegal, and Tanzania finds that nonprofit organizations and for-profit corporations in the United States play the role of lead implementers and local organizations serve only as subcontractors to lead international actors; therefore there is limited use of local financial systems in delivering agricultural interventions (Tumusiime and Cohen 2017). Moreover, the impact of some of the agricultural technology

innovations (high-yield seeds) was limited because farmers lacked the cash or credit to purchase complementary inputs, including labor, to expand production.

## Building Effective Partnerships

International development partnership involves many stakeholders. Representative individuals, agencies, and departments of national and local governments, nongovernmental organizations, local communities and community-based organizations, private sector organizations, and international donor governments and their agencies are all important stakeholders (Brinkerhoff 2002). Each stakeholder contributes unique assets and skills toward sustainable development goals. National governments provide an enabling macroeconomic environment and legal and institutional framework as well as technical and financial resources. Local governments give support to program and project implementation at the micro-level, whereas nongovernmental organizations and community-based organizations mobilize local resources and support in local communities. As for international donors and agencies, they provide critical technical and financial resources, foster public-private sector partnerships, and stimulate action toward host country development goals and global sustainability priorities.

Partners in development often have divergent goals and motivations, but an effective partnership builds on trust, transparency, accountability, reciprocity, and respect and works to enhance cooperation and complementarity to achieve mutually agreed development goals (Schaaf 2015). In developing countries, national governments have an important role to play in achieving effective partnerships for sustainable development. One way is for national governments to provide an enabling macroeconomic environment and legal and institutional context that enhance development policy credibility. Research shows that a suitable mix of macroeconomic and institutional policies should combine fiscal discipline and leadership with monetary policy targeting low inflation and employment growth over time and anchor policy credibility in market expectations (Dzigbede 2016). Another way is for national governments to increase their political commitment toward mutually agreed sustainable development strategies. Roberts and Andrews (2005) describe how national and local budgets may not fully reflect mutually agreed development priorities, and especially during election years, government spending patterns may diverge from stated goals and create severe fiscal policy shocks that can constrain long-term economic development. It is also likely that the rhetoric of developing country governments in the international development space may not be backed by their operational support at the local government level.

International agencies must also play a significant role in building effective partnerships for development. A common challenge is the lack of adequate fit between international development assistance and the problem structure in developing countries. International agencies sometimes adopt a single set of solutions across developing countries, but more effective partnerships would require that international donors invest in tailored solutions that recognize macroeconomic and institutional setups, local administrative conditions, and political constituencies in specific countries and leverage the comparative advantages of all stakeholders to promote sustainable development in a country (Pattberg and Widerberg 2016). Additionally, a greater level of accountability, transparency, and trust is needed to allow host governments and international agencies to pool resources, disburse funds, and coordinate activities to achieve greater impacts on development.

Finally, the role of the private sector cannot be overemphasized. Public-private partnerships provide a unique way to achieve government goals of socioeconomic growth and redistribution together with business sector goals of managerial efficiency and global competitiveness (Houghton 2011). However, in the international development

landscape especially, the business sector emphasis on market efficiency and program performance must be weighed carefully such that it does not constrain long-term goals of social accountability, equity, and justice.

## Conclusion

This entry examined the main foci of international development agency programs in developing countries. It focused on USAID and DFID and tracked their achievements across priority sectors in developing countries. The entry discussed key challenges and concerns about international development effectiveness focusing on politics, institutions, and program management. The essay recommends that developing country governments, international development agencies, and private sector organizations all should strive toward making their partnerships more effective and aligned with sustainable development priorities in poor nations.

# International Financial Institutions: Lessons for Public Administrators

Thomas D. Willett[1] and Ravi K. Roy[2]
[1]Department of Economics, Claremont Institute for Economic Studies, Claremont Graduate University, Claremont, CA, USA
[2]Southern Utah University, Cedar City, UT, USA

International financial institutions (aka IFIs) play an essential role in overseeing the international financial system and the global economy. The international financial system embodies a complex mix of private sector agents institutional monetary and financial actors, and financial instruments. These include, for example, the

international banking system, portfolio equity and bond investments, foreign direct investment, as well as international remittances sent from workers abroad back to their home countries.

Sovereign countries attempt to take advantage of the benefits of globalization while mitigating the costs through various means. For example, they have the ability to manage exchange rates vis-a-vis other national currencies, exercise discretion over the degree of financial and trade openness, as well as make adjustments to their domestic monetary and fiscal policies. When national governments attempt to make policy adjustments to improve their country's own economic and financial positions, such activities can often have important implications for other countries. Consequently, there is need for national governments to cooperate in setting and agreeing to abide by certain international ground rules. Such ground rules, after all, help facilitate international trade and investment by tempering domestic pressures that promote economic nationalist policies that may harm other countries as well as help promote the harmonization of rules and regulations among them.

Governments and international institutions may work together in establishing, and when necessary enforcing, the ground rules under which the international monetary and financial systems operate. For example, they may provide financing for countries facing balance of payments difficulties, offer policy advice, provide development aid to low-income countries, as well as develop guidelines required to regulate the activities of large private financial institutions. Both the extent of international agreements, and the ability of international institutions to enforce them, can vary substantially from one issue area to another. For example, when addressing the question of how much international coordination is optimal, there is no one-size-fits-all answer. The answer depends on the size of the economies involved, the level of synchronization that exists among their domestic business cycles, and so forth.

International developments, such as war, terrorism, financial crises, and political revolutions, can heavily influence a country's financial stability and overall economic performance. In an interdependent global economy, the pursuit of economic policies that benefit one country can sometimes impose costs on others. Beggar-thy-neighbor trade and exchange rate policies adopted by a number of countries during the Great Depression of the 1930s, for example, proved highly destructive. Therefore, at the end of World War II the international community established three major international organizations to help promote greater stability and growth throughout the global economy. The General Agreements on Tariffs and Trade (which has evolved into the World Trade Organization), the International Bank for Reconstruction and Development (the World Bank), and the International Monetary Fund (IMF) were established to promote mutually agreed upon trade and financial rules and create a stable currency regime. Over time, these institutions have been supplemented by more specialized organizations such as the regional development banks and the Bank for International Settlements, which help oversee international banking regulations.

The effectiveness of various international financial institutions has varied greatly across organizations. The International Monetary Fund, in particular, has been one of the most effective of the IFIs in fulfilling its primary obligations. However, the IMF has not been able to avoid harsh (and often unfair) criticism. IMF policies, known as "conditionalities," which characteristically call for recipient countries to adopt monetary and fiscal austerity programs to help them fight inflation and stabilize their currencies, have tended to draw the most criticism. To be sure, austerity can be tough medicine to swallow for many of the governments and their peoples who must live under it. But while such measures can be painful in the short-term, they are part of a necessary regime to help countries get back on track economically.

In an economically interdependent world, national economic policies can be more effective if they are coordinated across countries (or by units within them). Such coordination, however, comes at a price. While tax policies or banking regulation, for example, tend to be more effective

when they are coordinated among countries, the imposition of common standards simultaneously limits the autonomy national governments may exercise when responding to unique domestic economic challenges and opportunities.

Not surprisingly, countries that have benefited from increased coordination tend to hold positive views of globalization, while countries that have been disadvantaged through such international agreements do not. There are some domestic groups that gain and others that lose from international engagements. Consequently, domestic actors often disagree over which national policies are optimal and which should be avoided.

Many countries have deliberately adopted international trade agreements that have been even more liberal than those advocated by the World Trade Organization while others have embraced more protectionist policies. A number of countries in Europe have chosen to surrender domestic autonomy over their national currencies to a regional central bank, while other countries, such as the Britain, have chosen to retain control over their domestic currencies. Common currency areas, such as the Euro, not only impose certain constraints on the national macroeconomic policies of participating countries but also potentially increase their exposure to economic crises originating from neighboring countries. Consequently, countries outside of the common currency area (like Britain) not only maintain greater discretionary control over their own macroeconomic policies (compared with those inside the Eurozone) but they are often more insulated from others' economic problems.

## Lessons for Public Administrators

Experiences with the operation of international economic and financial agreements and institutions have a number of important implications for public administration. For example, it is important to recognize that different individuals and groups tend to view the same events and developments from very different angles. Consequently, their perspectives tend to vary greatly. For example, evaluations offered by different individuals and groups of the IMF's performance are often heavily shaped by divergent cognitive lenses or mental models. To a certain extent, all theoretical lenses of the world engender certain flaws and weaknesses. That said, statistician George Box (1987, p. 424) once noted that "[e]ssentially all models [theories] are wrong, but some are useful." Therefore, public administrators must be ever-cognizant of how normative biases can seep into objective policy analysis.

While those on the political left (who operate with a critical lens of IFIs) often claim that the IMF enforces austerity measures that are excessive and not absolutely essential for restoring stability, some on the right (who adopt a more charitable view towards IFIs) have charged that the IMF has been too lenient in the way that it has enforced its structural adjustment programs throughout the developing world. In actuality, however, the IMF tends to be more strict in the way that it administers its financial programs to larger, geopolitically important and advanced countries and less rigid in the way that it administers its programs for smaller and less geopolitically important countries.

One must recognize that the various national economies that operate within the international financial system vary widely with respect to their economic and political strengths and weaknesses. Some countries, for example, have well-functioning governing structures in place, while others are not as well-developed. Some governments operate in a transparent manner, while the operations of others are opaque and, hence, less trustworthy. These complexities make the tasks and functions of those administrators working for these IFIs often messy and politically unpopular.

Another important point is that public administrators would do well to avoid the common mistake of conflating correlation with causation in their analysis of the IMF and other international agencies and institutions. Most evaluations that

assess the effectiveness of IMF programs are commonly tied to the economic performance of recipient countries, which, admittedly, is often disappointing, and in some cases heart-breaking. Consequently, most of the blame for poor economic performance experienced by a given country that has received IMF assistance is often squarely placed on the IMF. Responsibility is rarely placed on the recipient country. Such evaluations often overlook the fact that these recipient countries often possess weaker economies in the first place and do not petition the IMF until they fall into deep economic despair. While more detailed evidence confirms the fact that IMF programs often do result in poorer economic conditions in the short term, this evidence simultaneously confirms that these unfortunate conditions are often unavoidable. The overwhelming empirical economic evidence reveals, that in order to temper or halt run-away inflation, temporary recessions are needed to cool down the economy. Therefore, when conducting rigorous analysis, one must be careful to distinguish between the short-term and the longer-term effects of IMF policies and programs.

At the same time, some of the criticism of the IMF's seemingly single-minded approach to helping developing countries get on-track may carry some validity. In the past, much of the scholarly analysis on the IMF's role in overseeing the international monetary system was narrowly focused on economic efficiency. Little attention was paid to the political constraints embedded within the structures of different countries. In more recent times, however, the IMF has been adopting a more enlightened approach which places greater focus on studying and analyzing the unique domestic political and economic factors that shape a particular nation's financial profile. Rather than attempting to rigidly impose a single, one-size-fits-all model on all countries, the IMF has been adopting a more flexible approach that takes into account the domestic political realities of a country and its institutional capacity to successfully coordinate its policies with others. Historically speaking, the design of IMF programs aimed at assisting countries with balance of payments difficulties have tended to narrowly emphasize those that appear to be the most technically efficient. The failure of many IMF policies has been the result of strong domestic political opposition that has arisen in many of the home countries where these policies were being implemented. Such political opposition resulted in the abandonment (or only partial implementation) of key aspects of the programs. Consequently, the IMF has been emphasizing policies that are more realistic and have a good chance of being implemented successfully in the real world. Of course, one must conduct very careful political as well as technical analysis when making such decisions. This is a lesson that applies to almost all levels of public administration, be they local, national, or international.

# International Issues in Corruption Management

Leonard L. Lira
Political Science Department, San Jose State University, San Jose, CA, USA

## Synonyms

Corruption and Ethics; Corruption Perception Index; Transnational Governance; Transparency International

## Definitions

Corruption: An activity that misuses entrusted power for private gain by reducing the public value of a public good to compensate that private gain.

## Introduction

Researchers and experts view corruption, especially the international variety, as a crime of fraud and abuse of public office that generally occurs "over there" and not in their own backyards. However, recent media reports of widespread corruption at the international level, both in developing and developed nations, demonstrates that international corruption is at the same time both a local and global phenomenon. In fact, corruption on the international level reaches all countries and all facets of public life. It is evident in the highest offices of the capitals around the world, from the Ex-President of Brazil, who was recently sentenced to serve 15 years in prison for corruption charges, to a current sitting US President and his administration under investigation for conspiracy with a foreign power, and where several of his cabinet officials are under investigation or have resigned their posts due to ongoing corruption investigations.

Corruption on the international level undermines not only democratic institutions but also the institutions built to protect those democratic efforts domestically and abroad. For example, the New York Times reported that corruption degraded the capacity of Ukraine military to protect its governmental institutions. At the same time, the Wall Street Journal reported that NATO stood up a task force to root out corruption that its own military operations created in Afghanistan. Other media reports described how the pervasiveness of international corruption extends even to international tennis, soccer, and the Olympics committee.

With the large variety of examples of global corruption, researchers and practitioners should focus on identifying and dealing with the major issues presented by having to manage international corruption. These issues include understanding the multiple ways the international community defines corruption and the issues this creates, understanding the challenges of corruption to transnational governance, understanding the impact of international corruption on developing and developed nations, and knowing what the latest tools are used to deal with international corruption. Studying these issues from these perspectives will provide a comprehensive and up-to-date overview of main issues in managing international corruption.

## Issues with Defining Corruption

The definition of corruption most often cited in the research literature comes from the international organization, Transparency International (TI), and describes corruption as the misuse of entrusted power for private gain. The definition is both simplistic and elegant. It both distinguishes the context (entrusted power) and indicators (private gain), in one statement. This makes the allure of studying corruption all the more appealing as compared to the often ambiguous study of ethics. However, its simplicity is both an advantage and disadvantage when studying corruption at the international level of analysis.

Terms used to define corruption internationally include a spectrum of definitions like "petty" and "grand" or "low forms" and "high forms" (van

Schoor 2017, pp. 17–18). This highlights the main issue in defining international corruption. To define it at the international level of analysis, one has to define what corruption means in diverse contexts across various nations and cultures. TI's simple definition is susceptible to criticism that it emanates from a Western developed nations' contextualization of corruption. Thus, it has been disparaged as "monochromatic" and too focused on endogenous reasons for corruption in developing nations, such as poverty, disease, tribalism, and other ails of underdeveloped nations such as bureaucratic pathologies or the breakdown in the rule of law (de Maria 2008). It averts attention away from the exogenous causes of corruption stemming from international business centric causes and overweighs international business welfare above indigenous human rights welfare.

Further, the Corruption Perceptions Index (CPI), published by Transparency International and based on its definition of corruption, focuses attention on corruption from a political perspective that conduces to Western business interests and is nonsupportive of the home country's anti-corruption efforts. For example, the World Bank and Transparency International both assess China and South Korea poorly on the rule of law and control of corruption. However, Seoul Metropolitan Government can demonstrate high rates of online citizen participation (Holzer and Kim 2007). And the Guangzhou Municipal Government leads the region in government information disclosure rules, citizen participation law, and administrative regulations. Even in nations with less developed economies than South Korea or China, the common structural networks of law and democratic institutions may not exist that help makes the payment and delivery of government services as transparent as it does in more developed nations. Thus, what may appear as corruption from a Western viewpoint, may be a necessary process to governing for nations given their current level of development.

Consideration needs to be given for nations with under-developed economies that do not have the structures in place to exhibit or the capacity to demonstrate the levels of transparency expected in more developed nations. Just as the Western bureaucrat who receives personal compensation legally for delivery of public government service is legitimate, so too should the delivery of governmental services by tribal, or other organizational mechanisms, be viewed as legitimate as long as the greater value of the action contributes to the public good. Thus, researchers of international corruption should understand that the determination of the level of corruption should be based on what value the personal gain detracts from the public value of the activity in question, not merely on private gain or a lack of transparency alone.

## Challenges to Transnational Governance

International corruption represents a challenge to transnational governance. One reason is the distinction made in the international definition of private gain based on compensation for public good deliveries versus the public value gained based on societies payment for that private gain to exact the public good. Because the calculation of the personal gain versus public value is not easily derived, perpetrators of corruption at the international level can circumvent easy identification and disrupt preventative efforts across international borders. At the same time, private to public transactions executed in environments where weak institutions exist do not automatically lead to corruption. Whereas the definition of corruption as provided by TI implies strong institutional contexts, this is not always the case in all contexts at the international level where transactions occur transnationally.

Some achievement of basic governmental assumptions is necessary to operationalize the definition of corruption at an international level. To wit, Matten and Moon (2008) identify three underlying assumptions: a functioning political-economic market that allows for corporate discretion over responses to economic, social, or political factors; functioning governmental and institutions that guarantees, define, and administers the market and acts on behalf of the public good and interest; and finally, that these

governmental institutions are not captured by private interest for private gain. Thus, there is an inherent difference between how international business and donor transactions occur across international borders in the transnational socioeconomic spaces and how the international community describes its expectations for the transparency of such socioeconomic transactions.

As the number of social, economic, and political transactions occurring across national borders increases, the capacity of any one nation's government to administer such transactions decreases and the ability to ascribe accountability becomes harder. The authority to govern such transactions is more diffuse at the international level, precisely because of a lack of common contextual understanding of the cost and benefits of such transactions. Therefore, there exists a need to understand the meaningful differences of corruption in differing contexts and to research how these differences are diffused, adopted, and implemented in different international settings. Researchers should also study how international institutions, national and local governments, and relevant stakeholders play in this process. Understanding the impact of transnational corruption is essential so that the problem can be properly defined. The transnational characteristics of international corruption exemplify the challenges presented when trying to deal with it at the international level.

## Corruption's Impact at the International Level

Internationally, corruption affects the trade between and the prosperity of countries, the governance capacity of both developed and developing nations, and the level and quality of international security. Corruption has a statistically significant and negative relationship on a country's Gross Domestic Product and significantly impacts the corporate liquidity of both international and national firms (Chen 2011). For example, the Christian Science Monitor reports that corruption takes up one third of Russia's GDP, approximately $318 US dollars. Additionally, Egypt's level of international trade could be much higher if the international perception of corruption in Egypt was more on par with developed nations (Shirazi 2011, p. 442). However, beyond the impacts to the public and private domains, international corruption is not the only factor impeding international trade. Nationalistic policies on tariffs, corporate tax rates, and capital control, as well as geographic location, labor costs, and transportation infrastructure are significant factors impacting international trade (Shirazi 2011). This is not to say that international corruption is not relevant or that the international community should not develop anti-corruption regimes. It does point out, however, that international corruption may not be the sole issue impeding international trade, and therefore should not be the sole focus. Especially, since it is so reliant on contextual interpretations that are susceptible to cultural biases. Still, the research indicates that reducing international corruption will have as much, if not more, of a favorable effect on stimulating international trade as trade laws, lower tax rates, and international currency control measures (Shirazi 2011).

Beyond economic impacts, international corruption severely constrains both the decisions of international donors and flexibility of developing nations to access the resources necessary to build the social, economic, and political structures of governance to combat corruption. The perception of corruption by donor states about developing states often dissuades donor states from investing in economic and social programs (Anna et al. 2013). This creates a donor-client dilemma scenario where the donor wants evidence of anti-corruption structures to be in place, so they can confirm to their constituents that their money will not be ill invested, and yet the client state first needs the capital resources that donor nations could provide to install the very protections that the donor states expect. This, in turn, causes developing nations to go to illicit markets to find the resources to establish anti-corruption governance regimes, which delegitimizes the effort of anti-corruption efforts of the international community, such as the USA's Millennium Challenge Account (Brazys 2016).

The conflict in Afghanistan provides examples of how this dilemma plays out in the international arena. In that conflict, international donors established requirements for broad goals of governance capacity building and institutional reform at the 2008 Paris Conference to resource international stability efforts in that country. By focusing solely on governance and institutional reform, the efforts of the international donors miss the political causes of corruption in the ravaged and the war-torn country (Forsberg and Sullivan 2016).

With the rise of globalization and the interconnectedness of cyberspace, international corruption has even more of a direct impact on the international system from a security perspective. For example, corruption facilitates international security threats derived from interdependent relationships between state government officials and transnational crime networks, or the facilitation of terrorist organizations (Chayes 2014). The complete lack of borders and specific international security regimes in cyberspace only compounds the problem.

In a domain, such as cyberspace, where there is little to no recognition of international borders, the lack of governance capacity only strengthens illicit actors and weakens legitimate state authority (Hughes and Miklaucic 2016). Thus, this creates an environment that is highly susceptible to all forms of corruption and serves to only increase the risks to international security. Moreover, while media coverage of potential cyber-attacks usually focuses on the risks posed by foreign governments, terrorist, and internet activists, the most likely source of security risk stems from corrupt public and private employees who abuse their place of trust and privileged access by selling information for personal gain.

Another area where corruption directly affects international security is within the military institutions that were built to provide the very protections against the destabilizing effects of corruption. Interestingly, while there has been much research on corruption in other international sectors, there has been relatively little done on the military and international security sector (Pyman 2017). However, the defense and security sectors are particularly vulnerable to corruption in five areas: political corruption issues, financial corruption issues, personnel corruption issues, operational issues, and procurement issues (Pyman 2017, p. 515). With regard to corruption reforms within the militaries of several countries, some cases of reform have proven successful more because of administrative rule changes that adjust career patterns and power structures of high-ranking military officials, than to changes in the rule of law to criminalize such activity (Pyman 2017, pp. 522–523).

## Tools to Deal with International Corruption

Efforts to root out corruption at the international level exist despite the lack of a coherent definition or understanding of the transnational and true impact of international corruption. This lack of a coherent definition and understanding of international corruption has led to some blunt tools such as the CPI, as established by Transparency International. However, three main efforts consist of the development of compliance-based measures of anti-corruption policies, technologic efforts, and the establishment of the international rule Law. Compliance-based measures consist of internal national initiatives such as civil-service reforms that protect against political influence over bureaucratic careers outside of the due processes of civil service administration (Nistotskaya and Cingolani 2016). While compliance-based measures are viewed in the literature as insufficient (Stevulak and Brown 2011), they are nonetheless a starting point for the establishment of a baseline of anti-corruption policies that transcend both national and international levels.

The emergence of several information-based technology tools is pushing forward an era of anti-corruption efforts that is predicated on revolutionized methods of corruption detection, prevention, and analysis. This technology includes systems for the accumulation of big data and the development of software to detect collusion and fraud in transnational activities. Fields such as public health, trade, and taxation are employing big data to root out corruption. While previously,

corruption could hide within massive amounts of data, like a needle in a haystack, new data management techniques developed to handle big data have reduced the inconspicuous nature of corruption hiding in plain sight. Accountability and oversight are being enhanced by new processes and tools of data mining. These processes are being incorporated at the international level into e-government and e-procurement activities to identify high-risk transactions for fraud and susceptibility to corruption. Lastly, with the ubiquitous availability of mobile devices, the development of mobile apps is occurring so that the public and governments can easily gather data, analyze it, and assess and detect corruption in electronic transactions. A specific example from media reports is the use of QR tags to assess the stage projects are at and provide specific information on the cost and timeline until completion.

Lastly, the most widely used tool to circumvent international corruption are the regimes of international laws that make up the conventions against corruption. Foremost among them is the United Nations Convention against Corruption. According to the UN, the convention against corruption is the only legally binding universal instrument available to counter international corruption. To do this, the convention addresses five areas surrounding corruption: preventive measures, criminalization and law enforcement, international cooperation, asset recovery, and technical assistance and information exchange. Signed by 140-member states, the convention is a unique tool in the fight against corruption, in that it outlines a policy for asset recovery and return to the rightful owners. Despite its expansive nature and legally binding articles, this convention also has been criticized as too vague in some aspects such as non-mandatory criminal prescriptions for domestic laws of signatory nations (Rose 2015).

## Conclusion

The lack of a truly international definition of corruption and an understanding of challenges due to its transnational nature leads to a North-South and East-West bias in the perception of what constitutes corruption. For instance, surveys of bribery, often used as an indicator of corruption, take into account the bribe taker in developing countries, but not the briber-giver. This misses both the causation and level of impact such corruption incurs. An endogenous perception of corruption is that it is due to a lack of institutional reforms needed by developing countries to enter into legitimate membership with developed nations. However, this perspective completely discounts the impact that exogenous factors of predatory international businesses exhibit in intentionally dampening the efforts of underdeveloped nations to instill such necessary institutions.

Thus, the true impact of international corruption is the sustainability of the status-quo that circumvents regulation simply because it can evade agreed upon definitions. The current research into this aspect of international corruption falls short of providing real empirical estimates of international corruption. This article contends that researchers and practitioners should define levels of corruption according to how much it detracts from the public good to serve private interests, instead of its contribution to or detraction from the international level of global productivity. Developing realistic models of impact, based on contextual definitions of corruption are important to developing international anti-corruption efforts. This will lead to a better understanding of corruption's true impact at the international level and the development of realistic tools that are necessary to combat it.

# International Local Cooperation

Kristoffer B. Berse
National College of Public Administration and Governance, University of the Philippines, Quezon City, Philippines

## Synonyms

City-to-city cooperation; Decentralized development cooperation; International municipal cooperation; Municipal international cooperation; Transnational municipal cooperation

## Definition

International local cooperation (ILC) is a form of public-public partnership that involves cities from two or more countries and is chiefly carried out with the active participation of local authorities.

## Introduction

As cities become deeply embedded in the global economy, they also usher in an era of intensive global networking. (In this article, the terms "municipality," "city," "local government," and "local authority" are used interchangeably.) By the turn of the twenty-first century, it has been estimated that as much as 70% of cities worldwide are connected to other cities in one way or another. This rise in "municipal internationalism" (Hewitt 1999) has been facilitated in large part by the growth of international networks involving local actors, as well as by rapid technological advances in telecommunications and transportation. Strategic changes in international development cooperation coupled with significant paradigm shifts in public administration and governance discourses in the last two decades of the twentieth century – which practically expanded the range of actors that donor agencies work with in the implementation of official

development assistance – also paved the way for this growth (Hafteck 2003).

Yet it must be noted that the linking of cities in the global arena is not entirely new. Urban historians would trace the initial seeds of international municipal cooperation to the establishment of the International Union of Local Authorities (IULA) in 1913. The organization, which survives up to this day, provided a platform for local actors at that time – most notably local officials and urban planners – to link up and exchange notes on various aspects of urban planning and management, eventually paving the way for the formal formation of "municipal connections" beyond the boundaries of the nation-state (Saunier 2002). This local interaction gained traction after the Second World War as more structured forms of local cooperation were forged in pursuit of long-lasting intercontinental peace. In the USA, the "sister cities" program was formally established in 1956 as part of the "citizen diplomacy" initiative of then President Eisenhower to heal the wounds of war through cultural and community-to-community exchanges (Zelinsky 1991). In Europe, earlier "town twinning" arrangements among French, German, and English cities were preoccupied not only with rebuilding war-torn localities but, more importantly, in preventing the escalation of another intra-European conflict. This twinning of towns signalled, in the words of Vion (2002: 623), the "first step taken by municipalities to define their interests on the international stage."

To date, cities from faraway lands have partnered together to tackle mutually shared agendas, from issues as big as climate change to concerns as mundane as street lighting. International local cooperation has since shifted from merely promoting the pacifist goals of the early sister or twin cities movement to supporting local development objectives. Subsequently, from a singular focus on cultural, people-to-people exchanges, the locus of cooperation is now more varied, encompassing a plethora of urban concerns such as housing, services, economic development, disaster risk management, climate change, urban design, road administration, and solid waste management, among others.

## International Cooperation Among Local Authorities

Cooperation involving local authorities is not an exclusive international affair. It can also take place among local actors within a municipality (intra-municipal cooperation) or between two or more local authorities from the same country (inter-municipal cooperation). Logically, domestic cooperation offers a good chance for success as the participating local authorities operate under the same legal and administrative structures and are familiar with historical and cultural issues at least at the macro-level. However, this has not been the case all the time. In the UK, for example, Kelly (2007: 319) observed that certain historical and policy factors "often encouraged (local) councils to compete, rather than to work collaboratively with each other." As a result, there has been limited horizontal cooperation among local authorities, while principal-agent relationship between higher and lower tiers of government continues to be the dominant partnership model.

On the other hand, there were also changes in how official development assistance was being rolled out since the 1980s. Hafteck (2003) noted that governmental reforms, innovations, and decentralization in many parts of the developing world, along with a realization of the limitations of nongovernment organizations as old development partners, ushered in the participation of a wider set of actors, most notably local authorities, in international development cooperation. On the side of cities, this was a welcome opportunity as they faced emerging complex challenges attendant to urbanization and devolution of certain governmental functions, which required new perspectives and approaches.

The limitations of domestic interlocal cooperation and significant shifts in international municipal relations and development cooperation thus opened the door for a third type of local partnership that involves the interaction of local authorities across national borders. International local cooperation (ILC) is used here as the overarching term to refer to a form of substantial public-public partnership that chiefly involves local authorities

from two or more countries. It is variably referred to as international municipal cooperation (IMC); municipal international cooperation (MIC); city-to-city cooperation (C2C); decentralized development cooperation (DC); and transnational municipal cooperation (TMC) in both academic and gray literature that span across urban studies, development cooperation, public administration, and international relations (Berse and Asami 2015). Regardless of nomenclature, ILC shares the following characteristics of decentralized cooperation as identified by Hafteck (2003: 336):

- Lead actors: essentially local governments (chiefly municipalities), but also regional governments, districts, etc. The issue of geographical territory and of areas of jurisdiction is implicit and in direct relation to the institutions involved.
- Broad purpose: development at the local level. It implies carrying out activities in one or several developing countries (i.e., the global South) or in countries in transition (i.e., the East).
- Means involved: exchange of people and know-how, monetary, or in-kind contributions (including advisory services, supplies, and training). It excludes superficial linkages with unclear objectives as many municipal twinnings tended to be in the past.
- Participation and contributions of other actors: civil society, nonprofit, and private sector. These "locally based actors" have been increasingly collaborating with local authorities in their localities on a range of subjects (c.f. public-private partnerships, public-community partnerships) and are also involved in international activities carried out by their local governments.

In this sense, ILC distinguishes itself from other forms of international municipal linking such as traditional sister or friendship city relationships and town twinning. Compared to sister or friendship city arrangements that are largely preoccupied with sociocultural community exchanges, ILC is more development-oriented and geared toward substantial collaborative relationships and mutual learning through peer-to-peer knowledge exchange and mentoring and joint problem-solving. As such, it has been seen as a viable mechanism to build local capacity, strengthen urban governance, and ultimately facilitate the appropriation of urban policies from one area to another, albeit not without debate as to how such policy transformations really take place or how much of the transferred capacities are absorbed by the recipient institution. How ILC differs with other modalities of international intercity cooperation is discussed further below.

## Modalities of Intercity Cooperation

Douglass (2002) observed that there are at least four types of intercity cooperation that may take place at both subnational and international levels. Internationally, the most common type involves information and cultural exchange among partner cities and is usually carried out as part of friendship, sister city, or town twinning agreements. To date, the US-based Sister Cities International (SCI) boasts a wide membership of nearly 500 communities with over 2,000 partnerships in more than 140 countries around the globe. Elsewhere in the world, "twin" and "friendship" cities have been formed in varying levels of intensity.

The second type of partnership involves co-sharing of resources in the provision of common infrastructure and services. At the international level, this is best exemplified by the International Association of Ports and Harbors (IAPH) which is composed of some 200 leading ports in 90 countries. The Organization of World Heritage Cities (OWHC) and the European Association of Historic Towns and Regions are other examples of this type of cooperation in the area of heritage conservation.

The third type of intercity cooperation is aimed at fostering economic integration among cities in the region. The so-called Sijori Triangle which involves the intentional linking of industries in Singapore, Johor Baru in Malaysia, and Riau in Indonesia to promote "complementation in production" illustrates this kind of

arrangement. The Busan-Fukuoka transborder economic partnership is another case, wherein the ties between local authorities have considerably expanded from its inception in 2009 to one that now includes the active involvement of quasi-public bodies such as economic associations and education institutions. The Beijing-Seoul-Tokyo (BESETO) corridor is another example of an attempt to integrate the capital cities in East Asia.

The fourth type involves political integration in the form of a "league of cities" with independent and legitimate decision-making powers. As noted by Douglass (2002), while amalgamation of municipalities has been attempted domestically as in the case of South Korea's "shi-kun" (urban-rural) initiative and Indonesia's "kawasan andalan" (regional clusters), this is usually difficult to achieve at the international level. National governments are still the preferred entry point for cooperation with traditional development agencies such as UN agencies and the World Bank, although intercity networks are now starting to go beyond mere information exchange, co-production of knowledge through research, and light diplomacy, as initially observed by Douglass (2002). Nowadays, intercity networks such as the C40 Cities have started to advance their own political agenda in pursuit of a common goal, independent of the activities of central governments.

ILC, as defined here, forms the fifth type of international intercity cooperation involving local authorities. It is essentially a hybrid arrangement combining the features of all other forms described by Douglass (2002) as it can take place within or outside the context of traditional twinning and often goes beyond economic promotion and political integration. The UN-Habitat describes such international municipal cooperative arrangements as a partnership that is carried out directly and exclusively by participating cities themselves through their local authorities, wherein a resource city directly extends technical assistance to a beneficiary city (Bontenbal 2009).

Within CITYNET, a long-standing association of local authorities in the Asia-Pacific, the C2C process is enriched by the participation of additional partners (Tjandradewi and Marcotullio 2009). Providing financial, managerial, administrative, or technical support, this third party can be a nongovernment organization, a private sector entity, an academic institution, a development organization, or an association of local authorities. In the case of Dutch-Peruvian municipal partnerships, the VNG International, the Dutch local government association, has been reported to be instrumental in the implementation of international partnerships (Bontenbal 2009).

Many ILCs have been forged under the auspices of a city network. In Asia, this arrangement is fairly common, with many local government organizations adopting interlocal cooperation as one of their programs to promote interaction and facilitate exchange, if not propagation, of best practices among their members. On the sustainability front, there are at least 24 city networks that promote intercity cooperation globally, such as ICLEI-Local Government for Sustainability, United Cities and Local Governments, Asian Cities Climate Change Resilience Network, and C40 Cities, among others.

## Why Do Municipalities Cooperate Internationally?

The practice of learning from abroad per se is not entirely a new phenomenon, but the overt practice of cities extending a helping hand to another city across borders, if not working together on a mutual issue, is fairly recent, becoming prominent only in the last quarter of the twentieth century. Cities have different reasons for engaging in ILC, but generally, these can be categorized into four distinct, albeit not mutually exclusive, paradigms, as discussed below.

### The Internationalization Paradigm

For many big cities, ILC is seen as an opportunity to boost the image of the city in the international milieu. For example, Yokohama's involvement in the C2C program of CITYNET is part and parcel of the city's internationalization agenda. By sharing its accumulated skills and know-how to other

cities in the region, its reputation as a leading city in many aspects of governance (e.g., water and sewage, waste disposal, disaster risk management, etc.) is strengthened, thereby bolstering its overall image to attract the interest of foreign visitors and investors. The transfer of a specific industrial technology is also part of this framework, as in the case of several city-to-city exchanges under the auspices of the erstwhile Kitakyushu Initiative for a Clean Environment.

This paradigm is in line with the rise of cities in the international stage as they become embedded in a network of local "internationals" (Alger 1999) – local authorities, local government associations, nongovernment organizations, churches, relief agencies, private corporations, and other community-based actors – interacting at varying degrees of intensity and commitment, in pursuit of goals as big as curbing global warming or as small as improving street lighting. For Douglass (2002), one of the reasons why cities cooperate is to leverage their competitive advantage, if not to foster economic integration, by co-sharing of resources such as in the provision of common infrastructure and services.

In this context, ILC becomes one of the many mechanisms to expand the reach of cities and bolster its international city brand, in the hope of advancing long-term economic and commercial ends. As such, this paradigm approximates Buis' (2009) economic motive for C2C cooperation and is tangential to Campbell's (2012) exposition on smart cities working in "clouds of trust."

### The Development Cooperation Paradigm

To many cities from the South, this is the main incentive for engaging in ILC. It serves as an additional source of resources that allow cities to carry out certain programs, projects, or activities that were otherwise beyond their internal capacity, whether financial, human, or technical. As a development cooperation strategy, it is in line with the recognition of local authorities as development partners by the United Nations, as recognized in the 2005 UN Summit that reviewed the progress of the MDGs. Their role as development partners has since been reaffirmed in recently adopted global development frameworks, such as the Sustainable Development Goals 2030 and the New Urban Agenda.

Historically, Hafteck (2003) attributed this infusion of "aid" to municipalities as a result of the disenchantment of the development aid community with NGO-driven initiatives at the close of the twentieth century. Indeed, ILC has been employed as a decentralized development cooperation strategy to address a wide plethora of urban concerns, including urban poor housing, urban planning and waste management, transportation, and microenterprise development. Closely related to what Buis (2009) considered to be the idealistic motive behind C2C cooperation, this is normally manifested in North-South partnerships, although there have been a growing body of practice involving South-South transfers.

In this framework, ILC is considered to be an important mechanism for local development. In the context of network-supported partnerships, CITYNET believed that certain good governance principles must be pursued in order for a best practice transfer to be effective, namely, participation, transparency, accountability, inclusion, financial feasibility, and sustainability. The UNDP further adds that C2C partnerships must be anchored on the principles of mutuality and equity. For Bontenbal (2009), ILC should be viewed not only from how it contributes to the effectiveness (local authority as "service provider") and responsiveness (local authority as "community developer") of the city partner but also how it adds value to the capacity of civil society partners.

### The Capacity-Building Paradigm

International local cooperation has also attracted the interest of many cities by virtue of its potential to improve the capacity of the partnering cities. It is important to note that this particular aspect – the acquisition of new knowledge, know-how, and skills – does not only redound to the beneficiary city but to the resource city as well (Table 1). In UN-Habitat's view, ILC is particularly targeted at building the capacity of local authorities in such

**International Local Cooperation, Table 1** Mutuality of benefits in international municipal cooperation

| Elements of cooperation | Resource partner | Beneficiary partner |
|---|---|---|
| Technology transfer[a] | No | Yes |
| Skills transfer | Yes | Yes |
| Knowledge transfer | Yes | Yes |
| Know-how transfer | Yes | Yes |
| Financial aid | No | Yes |
| Cultural understanding | Yes | Yes |

[a]Technology refers liberally to include "soft" technologies such as programs, processes, and systems

areas as information and technical expertise, policy development and decision-making, policy implementation, institutional strengthening, and managing change and using external support.

While the benefits to the Southern partner (i.e., beneficiary city) are clear in ILC, there have been some questions as to how it contributes to the Northern partner (i.e., resource city). Studies have shown, however, that resource cities do get something in return such as the acquisition of "new angles" in doing or viewing certain urban issues (Johnson and Wilson 2009; Evans 2009).

ILC has been used to promote capacity building at three levels, namely, human resource development, organizational strengthening, and institutional reform targets. As a capacity-building strategy, it also falls under a particular niche in comparative public policy that zeroes in on lesson-drawing. In Buis' (2009) categorization, this particular paradigm aligns with the cities' idealistic motive for cooperation.

### The Community Cohesion Paradigm

ILC has also gained particular relevance among cities with a large migrant community where multiple identities have led to debates about concepts of citizenship. As an example, Evans (2009) cited how international municipal linking between the London Borough of Southwark and Sierra Leone had improved social cohesion in the former where there is a strong contingent of immigrants from Sierra Leone. He further noted other experiences in the UK where ILC linking has been utilized to improve social cohesion in multiethnic communities, including the partnerships between the London Borough of Tower Hamlets and Sylhet City Corporation (Bangladesh) and between Bradford Metropolitan District Council and the District Council of Mirpur (Pakistan). Meanwhile, Ewijk and Baud (2009) talked from a knowledge perspective about how Dutch municipalities have worked to integrate migrant citizens by linking with municipalities in their countries of origin (e.g., Turkey, Suriname, Morocco). ILCs of this type are often part of sister city or twinning relationships and viewed from the lens of transnational urbanism.

In other cases, ILC has been linked to consolidating political position and support on international issues such as nuclear proliferation and racial segregation (Alger 1999), hence giving rise to such terms as "subnational paradiplomacy" and "perforated sovereignty." Internally, it has also been applied to improve local government-civil society relations, promote citizens' participation, and strengthen urban governance in post-conflict localities and new democracies. This particular aspect of ILC traverses between the idealistic and political motives for cooperation in Buis' (2009) typology.

## The Road Ahead

International local cooperation is a product of the necessity to seek for external solutions and support in the face of growing urbanization pressures and of opportunities brought about by international development cooperation and the rise of transnational city networks and city mayors with global "catalytic influence" (Acuto 2013). Cities have never been more connected than today with the rapid advancements in communication and transportation technologies.

However, while prevalent in practice, scholastic research on the subject is fairly recent and relatively scant, although gaining steady interest among scholars in recent years. Much remains to be done in order to understand it better as a development mechanism, especially in the context of multilateral partnerships and transnational networks.

# International Monetary System and the International Monetary Fund, The

Graham Bird
Claremont McKenna College, Claremont, CA, USA

In brief, the international monetary system is the system through which countries settle debts with one another. It is needed for much the same reason as monetary systems are needed at the national level. Specialization requires things to be exchanged, and there has to be something that acts as a medium of exchange. This is the basic function of money. Specialization at the global level, or so-called globalization, requires an international medium of exchange. The world needs a system whereby people in one country using one national currency can buy and sell goods, services, and financial assets denominated in other currencies; this system is the international monetary system.

Any international monetary system comprises a number of elements. First, where countries encounter disequilibria in their balance of payments, there needs to be a mechanism through which such disequilibria can be corrected. This is the adjustment mechanism. Second, there has to be a way in which adjustment can be cushioned and spread over an extended period of time. Countries need to be able to finance balance of payments deficits, at least for some period of time. They may finance them by running down their holdings of international reserves or by international borrowing. This is the financing mechanism. Third, since many transactions are international in nature, there needs to be a mechanism for exchanging currencies, and there also has to be one that allows countries to hold on to a stock of international purchasing power. As a consequence of this, there has to be agreement on what are generally acceptable international reserve assets. The nature of reserve assets is a fourth element in the system. Next, if there are to be rules and responsibilities involved in

undertaking balance of payments transactions, there needs to be an international financial institution that sets these rules and oversees the operation of the international monetary system to try and make sure that the rules and responsibilities are met. The institutional arrangements that underpin its operation constitute the fifth element of any international monetary system. Finally, in a world where there is a high degree of international economic integration, institutional arrangements are also needed to try and ensure that policies in individual countries are coordinated. In any society where the behavior of one individual has implications for others, there is a need to coordinate behavior through a set of rules, laws, conventions, and defined responsibilities. In the world economy, the policies and performance of individual countries are likely to have a bearing on economic performance in other countries, and the international monetary system requires a mechanism for taking these externalities into account in a way that benefits the global community.

Over the years, the world has seen a number of different international monetary systems. These may be compared and contrasted in terms of how they deal with the above elements. The gold standard of the 1800s and the first part of the 1900s in principle sought to correct balance of payments disequilibria by calling upon international debts to be settled by changing the ownership of gold. Countries in balance of payments deficit would lose gold and experience a fall in their domestic money supplies that would then lead to a fall in prices that would help reestablish international competitiveness. Countries in surplus and with a net outflow of goods and services would experience a net inflow of gold, an increase in their domestic money supplies, and an increase in prices, making them relatively less competitive. However, as things turned out, countries proved to be reluctant to play by the so-called rules of the gold standard game. For example, when faced with rising unemployment rather than falling prices, deficit countries tended to opt to break the link between gold flows and the domestic money supply. Following the abandonment of the gold standard, there was a period of international monetary anarchy in the 1930s as countries pursued beggar-thy-neighbor policies based on competitive currency devaluations and protectionist commercial policies. The lack of coordination had adverse consequences for the world economy and led to a commitment to design a better system for the postwar world. This was devised at the Bretton Woods conference in New Hampshire in 1944.

The Bretton Woods international monetary system that emerged from the conference comprised a number of characteristics. Member countries committed themselves to maintain the par values of their currencies in terms of the US dollar, which in turn had its value expressed in terms of gold. However, the system allowed them to adjust their currency pegs if they encountered a problem of "fundamental disequilibrium" where it became impossible to achieve both the internal target of low unemployment and sustained economic growth alongside the external target of a sustainable balance of payments. While adjusting the peg was therefore envisaged as a way of correcting imbalances where other policies had failed, the intention was for countries to initially place emphasis on manipulating domestic demand as a way of inducing adjustment, with demand compression reducing balance of payments deficits and demand expansion reducing surpluses. Defending the values of currencies was seen as a way of ensuring international policy coordination. The International Monetary Fund (IMF) was established to oversee the operation of the Bretton Woods system and to provide short-to-medium-term financial assistance (under "adequate safeguards") to countries with balance of payments deficits as they sought to restore sustainability.

Although superficially the Bretton Woods system seemed to work reasonably well during the 1950s and 1960s, this appearance was somewhat deceptive. In practice, the system had a number of shortcomings that taken together culminated in its collapse in the early 1970s. The adjustment mechanism built into the system did not work well. Adjustment was slow and often ineffective, and the system involved an asymmetric distribution of the adjustment burden with surplus countries and creditworthy deficit ones able largely to avoid

it. Changes in exchange rates tended to be delayed for too long, meaning that misalignments in currency values encouraged speculative attacks that culminated in crises. With an inefficient adjustment mechanism, the financing capacity of the system seemed to be inadequate, and there was perceived to be a shortage of international liquidity. On top of this, the accumulation of externally held dollar liabilities in relation to the amount of gold held by the USA gradually eroded confidence in the US dollar that was the pivot of the system. The "Triffin dilemma" pointed to fundamental inconsistencies in the design of the system that simultaneously required the US dollar to be both a "strong" and a "weak" currency.

Amidst a spate of foreign exchange crises at the beginning of the 1970s, an international effort was made to shore up the system by organizing a devaluation of the US dollar (increasing the dollar price of gold) relative to other currencies and introducing a constrained degree of additional flexibility into currency values (introducing wider bands around central values). The attempt failed, and in 1973, the world moved over to an international monetary system based on much more fully and freely flexible exchange rates. In principle, this meant that adjustment would be more quickly, effectively, and symmetrically brought about by market determined changes in exchange rates. There would therefore be less need for international liquidity. In any case, following the oil crisis in 1973/1974, private international capital markets, particularly in the form of bank lending, had taken over most of the role of financing balance of payments deficits. For a time, there was a retreat from a centrally organized and managed international monetary system. The system to all intents and purposes had become privatized. With the collapse of the Bretton Woods system, some observers argued that the IMF was no longer needed.

However, by the beginning of the 1980s, it was becoming clear that international financial markets could fail. The "third-world" debt crisis provided evidence that countries could overborrow and international creditors could overlend. At the same time, the widely acknowledged overvaluation of the US dollar demonstrated that free foreign exchange markets could not be relied upon to generate a set of fundamental equilibrium exchange rates. In this environment, the IMF once again appeared to be systemically important. Its importance was further reinforced by the problems encountered in Central and Eastern Europe as the former command economies transitioned to more market-based economic systems and as the East Asian crisis hit in 1997/1998.

When initially established, a crucial part of the IMF's underlying purpose had been to help avoid international financial crises. The irony was that, as things turned out in practice, the Fund seemed to be most needed precisely when such crises occurred. The more successful it was in helping to avoid crises, the less it seemed to be needed. In the relatively benign global conditions of the first half of the 2000s, questions were again raised as to whether the IMF had become obsolete. Relatively few countries had programs with it. Moreover, it seemed to be impotent in helping to correct the increasingly large global economic imbalances that were seen as threatening international financial stability. Then the global financial and economic crisis happened. In its aftermath, the Fund began to reoccupy center stage as the world's premier international financial institution, although now, and on some issues, institutional competition came from the G20 in terms of macroeconomic surveillance and coordination and the Bank for International Settlements and the Financial Stability Board in terms of the supervision and regulation of capital markets and domestic financial systems.

As the IMF moves forward, it encounters issues relating to both its legitimacy and its effectiveness. Although it has 189 members spanning all parts of the world, a number of its organizational arrangements place relatively large amounts of power in the hands of a small group of advanced economies. By tradition, the managing director is always a European and the first deputy managing director an American. Advanced economies enjoy a disproportionately high share of voting rights according to many criteria, and the USA alone has an effective veto over key decisions that require a super majority. As the economic significance of emerging

economies continues to grow, increasing tensions over the Fund's management structure as well as its basic legitimacy are likely to follow.

In terms of its effectiveness, issues relate to the IMF's systemic role of multilateral surveillance and its ability to bring about appropriate international monetary reform, as well its bilateral dealings with individual member countries under the auspices of IMF-supported adjustment programs and the design of IMF conditionality. The issues are far from straightforward.

The international coordination of macroeconomic policy has been an enduring problem for the world economy; it is difficult to exercise effective pressure on surplus countries and on economically powerful deficit ones to pursue policies other than those that they see as being in their own short-term best interests. Managing the balance of payments becomes more difficult when problems emerge not only from the current account but, in the case of many emerging economies, from the capital account that exhibits considerable volatility and a pattern of surges and sudden stops. The design of appropriate macroeconomic policy becomes more complicated when there are ongoing academic debates about the impact of fiscal and monetary policy as well as exchange rate policy. On top of this, the IMF's central position in discussions relating to international monetary reform has been moderated by the evolution of important regional groupings in various parts of the world as well as by other international financial institutions. The IMF's involvement in attempting to help resolve the crisis in the Eurozone has sharply illustrated the problems that arise when there are ambiguities in the allocation of institutional responsibilities.

Far-reaching and fundamental reform of the international monetary system seems unlikely to occur in a discrete fashion. The circumstances that allow this to happen are extreme. What is more likely is that modifications will continue to occur in a modest and piecemeal way. While reforms may be informed by advances in knowledge with respect to international financial issues, they will also no doubt continue to be importantly affected by domestic and international politics.

# International Public Sector Accounting Standards (IPSAS)

Gwenda R. Jensen
International Federation of Accountants, Toronto, ON, Canada

## Synonyms

International public sector financial reporting standards

## Definition

International Public Sector Accounting Standards are international accounting standards for application by public sector entities to prepare their general purpose financial reports.

## Introduction

This chapter describes International Public Sector Accounting Standards (IPSAS) and the International Public Sector Accounting Standards Board (IPSASB). This description includes the process applied to develop IPSAS, other pronouncements developed by the IPSASB, the IPSASB's history,

and its governance arrangements. This chapter also describes how IPSAS apply to public sector entities and the extent of IPSAS adoption.

## International Public Sector Accounting Standards

IPSAS are financial reporting standards for use by public sector entities. IPSAS are developed by the IPSASB. They are the public sector equivalent of International Financial Reporting Standards (IFRS), which apply to private sector companies and are developed by the International Accounting Standards Board (IASB). As of January 2016 the IPSASB had issued 39 IPSAS.

Thirty-eight of the 39 IPSAS apply to financial reporting on an accrual basis of accounting. These IPSAS are called "accrual-basis IPSAS." The IPSASB supports reporting on an accrual basis and considers that financial reports prepared under the cash basis of accounting do not adequately address the needs of report users. However, cash-basis reporting is still used by many governments. The IPSASB developed its cash-basis IPSAS, *Financial Reporting under the Cash Basis of Accounting*, to improve the quality of governments' cash-basis financial reporting. The IPSASB considers that governments should use the cash-basis IPSAS as a stepping stone towards adoption of accrual-basis IPSAS.

The majority of IPSAS addresses financial reporting topics already covered by IFRS and require essentially the same accounting treatment as in their equivalent IFRS or International Accounting Standard (IAS). These IPSAS are termed "IFRS-converged IPSAS." Each IFRS-converged standard includes an appendix, which lists differences between the IPSAS and its equivalent IFRS. Differences include terminology differences (for example, IPSAS use the term "entities" rather than "companies"), revisions to address public sector specific issues (for example, IPSAS 17, *Property, Plant, and Equipment*, has special requirements for heritage assets), and implementation guidance to address public sector specific situations.

Six of the accrual-basis IPSAS are public sector specific IPSAS. These IPSAS are not based on an equivalent IFRS. The six public sector specific standards are: IPSAS 21, *Impairment of Non-Cash-Generating Assets*; IPSAS 22, *Disclosure of Financial Information about the General Government Sector;* IPSAS 23, *Revenue from Non-Exchange Transactions (Taxes and Transfers);* IPSAS 24, *Presentation of Budget Information in Financial Statements;* IPSAS 32, *Service Concession Arrangements: Grantor;* and, IPSAS 33, *First-time Adoption of Accrual Basis IPSASs*.

Recently, the IPSASB has begun to issue Recommended Practice Guidelines (RPGs), which apply to information reported outside of the financial statements. RPGs provide guidelines for good practice, rather than requirements, although an entity can claim compliance with an RPG when it fully applies an RPG's guidelines. To date the IPSASB has approved and issued three RPGs; RPG 1, *Reporting on the Long-Term Sustainability of an Entity's Finances;* RPG 2, *Financial Statement Discussion and Analysis;* and RPG 3, *Reporting Service Performance Information*.

All IPSASB pronouncements are published annually in the IPSASB's *Handbook of International Public Sector Accounting Pronouncements* (the IPSASB Handbook), in English. The official text for any IPSASB pronouncement is its English text. The IPSASB Handbook is also available in 14 other languages, including Arabic, Chinese, French, Spanish, and Russian. Translated versions of the IPSASB Handbook may be several years behind the most recent English version.

## The IPSASB and Its Development of IPSAS

As previously stated IPSAS are developed by the IPSASB. Development of high quality IPSAS that support the public interest requires appropriate arrangements for:

(a) IPSASB membership;
(b) Governance over the IPSASB; and
(c) Due process for development of IPSASB pronouncements.

### IPSASB Membership

The IPSASB has 18 members, appointed by the International Federation of Accountants (IFAC) on the recommendation of the IFAC Nominating Committee. The selection process aims to identify the best person for the job, which means that the primary criteria are the individual qualities and abilities of the nominee in relation to the position for which they are nominated. The Nominating Committee also seeks a broad regional and professional representation, representations from countries with different levels of economic development and a gender balance. For example, in 2015 the IPSASB's 18 members reflected the following geographic representation and gender balance:

(a) Africa – 2; Asia and Australasia – 6; Europe – 5; the Americas – 5
(b) Males – 13; females – 5

Until recently the majority of IPSASB member nominations were restricted to nominations received from IFAC Member Bodies. Nominations are now open and can be made by any organization or any individual.

IPSASB appointments are for a 3 year term, renewable for a further 3 years. IPSASB members usually serve a total of 6 years. If a member is appointed to either the position of IPSASB chair or deputy chair this has the effect of extending their term on the IPSASB for a further 3 years.

IPSASB members sign a declaration that they will act in the public interest and with integrity in discharging their roles. While members bring knowledge of accounting issues from their particular national jurisdictions, which is important for IPSAS development, they are expected to promote good quality financial reporting rather than accounting treatments that benefit a particular jurisdiction or particular organization's interest.

The IPSASB meets four times each year, in March, June, September, and December, for four consecutive days each meeting. Meetings are open to the public, who must register to attend. Three of the meetings usually take place in Toronto, Canada, where the IPSASB's technical department is located. The location of the fourth, non-Toronto meeting is chosen based on invitations received to host the meeting; need for outreach to particular countries or regions; host organizations' willingness to contribute towards meeting costs; and ease of travel to the proposed location.

Most IPSASB members are supported by a technical advisor, who accompanies the member to meetings. The IPSASB as a whole is supported by a technical department. Technical staff are employed by IFAC. They manage IPSASB projects, research and draft meeting papers and develop draft pronouncements and other documents for the IPSASB's consideration.

The IPSASB's official observers are from the following institutions: Asian Development Bank, European Commission, European Investment Bank, Eurostat, International Accounting Standards Board, United Nations, United Nations Development Program, the Organization for Economic Cooperation and Development (OECD), the World Bank Group, the International Organization for Supreme Audit Institutions (INTOSAI), and the International Monetary Fund (IMF). IPSASB observers represent organizations that have a strong interest in financial reporting in the public sector, provide ongoing input to the work of the IPSASB, and endorse or otherwise support IPSAS. Observers have the right to speak at IPSASB meetings, although generally they observe rather than participate in discussions.

### Governance Over the IPSASB

The IPSASB's governance arrangements provide assurance that the board is independent, acts in the public interest, and develops standards that result from widespread and carefully considered comment from interested stakeholders around the world. Significant changes to the IPSASB governance have occurred during 2015–2016. The IPSASB Governance Review Group, chaired by the IMF, OECD, and World Bank, with members from the Financial Stability Board (FSB), International Organization of Securities Commissions (IOSCO), and INTOSAI, published its recommendations on IPSASB governance in March 2015, in *The Future Governance of the International Public Sector Accounting Standards Board*

*(IPSASB) IPSASB Governance Review Group – Recommendations*, published by the OECD. The report's two main recommendations were establishment of a Public Interest Committee (PIC) and a Consultative Advisory Group (CAG). These changes have been made.

The PIC was established in 2015. As of May 2016 it had met three times – in March and September 2015 and March 2016. The PIC's mandate is to ensure that the IPSASB's procedures, also called due process, are acceptable from a public interest perspective. The PIC advises on the procedures used to develop IPSAS, RPGs, and the IPSASB's strategy and work plan. It considers the transparency of the overall process applied and each subsection of that process.

Appointment of the inaugural Chair of the IPSASB CAG, Thomas Müller-Marqués Berger, was announced in December 2015. The CAG's inaugural meeting was held in June 2016. The CAG provides advice to the IPSASB on:

(a) The IPSASB's strategy and work plan;
(b) IPSASB's projects, including views on technical issues or matters that may impede adopting and implementation of IPSAS; and
(c) Other matters relevant to the IPSASB standard-setting activities.

CAG members represent public and private sector organizations and individuals who are interested in or affected by the IPSASB's work, including those engaged in the preparation, audit, or use of public sector entities general purpose financial reports.

### IPSASB Due Process for Development of Pronouncements

The IPSASB has established "due process" for developing IPSAS, other authoritative pronouncements, and its strategy and work plan. Due process is a set of formal procedures carried out regularly and in accordance with established rules and principles. The IPSASB due process is similar to that used by the IASB and other international standard-setting bodies such as the International Auditing and Assurance Standards Board.

The main due process provisions for developing IPSAS are as follows:

(a) IPSASB meetings are open to the public.
(b) The IPSASB consults on development of its strategy and work plan.
(c) For development of an IPSAS (or other pronouncement) the IPSASB:
    (i) Approves a project brief.
    (ii) Develops and then approves an exposure draft (ED) of a proposed IPSAS, which is then issued for comment.
    (iii) Ensures that all comments received on the ED are publicly posted after the end of the exposure period.
    (iv) Develops a revised version of the draft IPSAS, taking into account comments received on the ED, and then votes on approval of the final revised content of the IPSAS. (A two thirds vote in favor is required for document approval.)
    (v) Sets an effective date for the application of the final, IPSASB approved IPSAS.
    (vi) The IPSASB issues a basis for conclusions with each IPSAS.

The IPSASB discussions, decisions, and approvals in the development process set out above occur at IPSASB meetings, so that each critical step of the development process is open to public view.

As part of the IPSASB's new governance arrangements, these due process provisions are being codified and revised for review and approval by the IPSASB's PIC. The PIC is expected to formally approve the IPSASB's codified due process during 2016.

Codification will be more detailed than the description above. Codification will identify where and how the IPSASB (or its Chair and Technical Director) obtains the PIC's review of the actual process followed by the IPSASB. The PIC will be involved in the development and oversight of the IPSASB's strategy and work plan, including providing advice on the appropriateness and completeness of the strategy and work plan from a public interest perspective. For all IPSAS projects, the PIC will provide its view on

whether due process has been followed effectively. Codification will also establish the CAG's involvement with the IPSASB's processes. The IPSASB will consult with the CAG on strategy and work plan matters and on the development and finalization of an IPSAS.

During development of IPSAS the IPSASB applies *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (the Conceptual Framework). It also refers to its two internal policy papers – *Process for Reviewing and Modifying IASB Documents* and *Process for Considering GFS Reporting Guidelines during Development of IPSASs*.

The Conceptual Framework consists of a preface and eight chapters, which address the following topics:

- Chapters 1–4: General Purpose Financial Reports (GPFRs), the objectives of GPFRs, users of GPFRs and their needs, qualitative characteristics of information in GPFRs, constraints on information in GPFRs, and the reporting entity
- Chapters 5–6: Elements in Financial Statements
- Chapter 7: Measurement of Elements in Financial Statements
- Chapter 8: Presentation of Information in GPFRs

The Conceptual Framework guides how the IPSASB addresses financial reporting issues. For example, when considering whether an event or transaction results in an asset that should be recognized in the financial statements, the IPSASB begins by considering the Conceptual Framework's coverage of assets and their recognition.

The IPSASB's *Process for Reviewing and Modifying IASB Documents* sets out the process that the IPSASB follows when considering IASB documents for convergence, including determining whether public sector issues warrant departures from the IASB document. This internal IPSASB policy paper, issued in 2008, clarifies how the IPSASB applies its IFRS–convergence policy. It sets out criteria for when an accounting issue can be addressed through convergence with an IFRS and when an issue warrants either a public sector specific departure from an IFRS or development of a public sector specific IPSAS. During IPSASB discussions this paper has been referred to as "The Rules of the Road."

When developing IPSAS the IPSASB aims to avoid unnecessary differences between Government Finance Statistics (GFS) reporting guidelines and IPSAS. The IPSASB's internal policy paper *Process for Considering GFS Reporting Guidelines during Development of IPSASs* describes the process applied to reduce such differences.

The policy paper explains that there is considerable overlap between IPSAS and GFS reporting guidelines. Both reporting frameworks are concerned with financial, accrual-based information; a government's assets, liabilities, revenue, and expenses; and comprehensive information on cash flows. Because of this overlap, there is scope to reduce differences while remaining consistent with both the IPSASB's Conceptual Framework and its policy on IFRS convergence. The policy paper also notes that GFS reporting guidelines and IPSAS have different objectives, which can result in some fundamental differences on how, what, and where information is reported. In considering scope to reduce differences the IPSASB aims to remain true to the objectives of financial reporting, with the result that some differences will always remain.

The IPSASB regularly updates its IFRS-converged IPSASs for relatively minor revisions arising from similar changes made to the equivalent IFRS or IAS. These regular updates are called "improvements." An Improvements project results in an exposure draft and final pronouncement, which usually result in revisions to an existing IPSAS rather than a new IPSAS. Improvements projects occur, on average, once every 2 years.

## History of IPSAS and the IPSASB

In late 1996, the IFAC Board enacted its decision to transform IFAC's Public Sector Committee (PSC) into an international standard setter for

public sector accounting standards. Prior to this, the PSC had been a forum for discussion and information sharing about public sector accounting and the wider set of public sector financial management issues. It had issued studies on concepts central to public sector financial reporting, for example, the information needs of users of public sector general purpose financial reports and the elements of financial statements. The PSC began its new role as a standard setter in 1997 but retained its name until late 2004, when it became the IPSASB.

Ian Ball had been the Chair of the PSC prior to the 1996 change and continued as Chair during the PSC's first years as an accounting standard setter, from 1997 to the end of 1999. He had led the implementation of accruals accounting in the New Zealand Government and was a Professor of Accounting at Victoria University of Wellington. The PSC began work on the first stage of what was called its "Standards Project." The main objective of the Standards Project was development of a core set of IPSAS, based on the IASs on issue as of 31 August 1997, by the end of 2001. By the end of 1999, the first eight IPSAS had been issued. Six further IPSAS had been approved by the PSC, and these were issued in early 2000.

Ian Mackintosh, formerly Chair of the Australian Public Sector Accounting Standards Board, was PSC Chair from 2000 to 2003. Six further IPSAS were developed and issued, so that the planned core set of twenty accruals-basis IPSAS had been completed by the beginning of 2004. The PSC also issued Study 14, *Transition to the Accrual Basis of Accounting: Guidance for Public Sector Entities*, Study 11, *Governmental Financial Reporting: Accounting Issues and Practices*, and *Financial Reporting under the Cash Basis of Accounting*. A project to harmonize IPSAS with GFS reporting guidelines began in 2003.

Philippe Adhémar, Senior Advisor at France's Court of Auditors, was PSC Chair for the period 2004–2006. During this time, two public sector specific IPSAS were issued – IPSAS 23, *Revenue from Non-exchange Transactions (Taxes and Transfers)*, and IPSAS 24, *Presentation of Budget Information in Financial Statements*. A project on accounting for social benefits was started, which resulted in issuance of an ED. The social benefits ED proposed recognition of certain types of social benefit obligations. In late 2006 the IPSASB decided to refocus the social benefits project to instead develop guidelines on reporting information on fiscal sustainability. During this same period the PSC issued a research report, *International Public Sector Accounting Standards (IPSASs) and Statistical Bases of Financial Reporting: An Analysis of Differences and Recommendations for Convergence*, which systematically documented similarities and differences between the two reporting frameworks. IPSAS 22, *Disclosure of Financial Information about the General Government Sector*, was issued in 2006. Work began on projects to account for impairment of cash-generating assets (based on IAS 36, *Impairment*), employee benefits (based on IAS 19, *Employee Benefits*), and disclosure of information by recipients of external assistance.

Mike Hathorn, a partner in the audit firm Moore Stephens, was appointed IPSASB Chair for the period 2007–2009. During his chairmanship, the IPSASB focused primarily on development of IFRS–converged IPSAS, aiming to converge with a stable platform of IFRSs as at the end of 2008. IPSAS 25, *Employee Benefits*, and IPSAS 26, *Impairment of Cash-Generating Assets*, were issued in 2008. IPSAS equivalents were developed for five further IFRS; IPSAS 27, *Agriculture*, IPSAS 28, *Financial Instruments: Presentation*, IPSAS 29, *Financial Instruments: Recognition and Measurement*, IPSAS 30, *Financial Instruments: Disclosures*, and IPSAS 31, *Intangible Assets*. These standards were issued from 2008 through to early 2010. The IPSASB also initiated the first IPSAS Improvements project to ensure that IFRSs/IASs revisions would be made on a regular basis to the equivalent IPSAS. Work began on the Conceptual Framework and a project on reporting service concession arrangements from the grantor (the government entity) perspective, while progress on the fiscal sustainability project continued.

In 2010 Andreas Bergmann, Professor of Accounting at the Zurich University of Applied Sciences' School of Management and Law,

succeeded Mike Hathorn as IPSASB chair. Andreas Bergmann's 3 year tenure was extended, and he served as IPSASB Chair for 6 years, until the end of 2015. During this 6 year period the IPSASB completed its Conceptual Framework, which was issued in October 2014. IPSAS 32, *Service Concession Arrangements: Grantor*, IPSAS 33, *First-Time Adoption of Accrual Basis IPSASs*, and the IPSASB's first RPGs were approved and issued. IFRS convergence work also continued. A project to revise IPSASs 6–8 was approved in 2011 and resulted in issuance of five replacement standards (IPSAS 34–38) in January 2015. Improvements standards were issued in 2010, 2011, and 2014. A consultation paper, *IPSASs and GFS Reporting Guidelines*, was developed, which generated an appendix comparing the two reporting systems, in the IMF's *Government Finance Statistics Manual 2014*, and IPSASB approval of its internal policy document on reduction of unnecessary differences between IPSAS and GFS reporting guidelines. Other projects during this period aim to address accounting for public sector combinations: public sector specific financial instruments, social benefits, revenue, nonexchange expenses, involvement in emissions trading schemes, and heritage assets. A project on Government Business Enterprises (GBEs) (or the applicability of IPSAS) was also initiated.

Ian Carruthers became IPSASB Chair in January 2016, after serving as an IPSASB member from the beginning of 2010. He is the first remunerated IPSASB Chair, spending 75% of his time in that role, while continuing to work for the Chartered Institute of Public Finance and Accountancy's (CIPFA), where he is part-time Chair, CIPFA Standards.

## Application of IPSAS

IPSAS are designed to be applied by public sector entities that:

(a) Deliver services to benefit the public and/or to redistribute income and wealth;
(b) Mainly finance their activities by means of taxes and/or transfers from other levels of government, social contributions, debt, or fees and do not have capital providers that are seeking a return on their investment or a return of their investment; and
(c) Do not have a primary objective to make profits.

IPSAS can be applied by national governments and entities that make up a national government, for example, government departments and related entities; lower levels of government such as state, provincial, or city governments; and international organizations such as the United Nations and the European Commission.

IPSAS are not designed to apply to GBEs. IPSAS 1, *Presentation of Financial Statements*, defines a GBE and explains that GBEs are similar to private sector, for-profit companies. GBEs include government owned utilities (for example, telecommunications and power companies) and financial enterprises (for example, banks and insurance companies). In March 2016 the IPSASB approved changes to how it communicates which entities should apply IPSAS. The definition of a GBE in IPSAS 1 has been removed and replaced with a paragraph in the preface to the IPSASB Handbook. The paragraph describes the type of public sector entity that the IPSASB expects to apply IPSAS, when it develops these standards.

## Adoption of IPSAS

There is no legal requirement at the international level for national jurisdictions or individual public sector entities to apply IPSAS. Where a national jurisdiction chooses to adopt IPSAS, that decision is then given effect through legislation or regulation. In the case of international organizations IPSAS adoption is a decision of the relevant governing body. For example, in the case of the United Nations IPSAS adoption was a decision of the United Nations' General Assembly.

When adopting IPSAS national jurisdictions generally issue national standards that are based on IPSAS and very similar to IPSAS. The extent of similarity varies between jurisdictions.

International organizations generally aim for full IPSAS compliance.

The IPSASB considers that:

> The adoption of IPSASs by governments will improve both the quality and comparability of financial information reported by public sector entities around the world. The IPSASB recognizes the right of governments and national standard-setters to establish accounting standards and guidelines for financial reporting in their jurisdictions. The IPSASB encourages the adoption of IPSASs and the harmonization of national requirements with IPSASs. Financial statements should be described as complying with IPSASs only if they comply with all the requirements of each applicable IPSAS. [Page 1, *Handbook of International Public Sector Accounting Pronouncements*, 2015 Edition.]

There appears to be a worldwide trend towards IPSAS adoption by national governments and other public sector entities. A 2013 survey by PricewaterhouseCoopers (PWC), the *PWC Global Survey on Accounting and Reporting by Central Governments*, estimated that, by 2020, 71% of central governments would have either adopted IPSAS or be in the process of implementing IPSAS.

While many governments have announced that they are adopting IPSAS, the actual level of adoption is difficult to ascertain. Presentations by IPSASB representatives indicate that more than forty national jurisdictions have adopted accruals IPSAS. However, few governments claim full compliance with all IPSAS requirements, instead adapting them to allow for local needs. A 2012 Eurostat report, prepared by Ernst and Young, *Overview and Comparison of Public Accounting and Auditing Practices in the 27 EU Member States*, found that eight European Union member states – Estonia, France, Hungary, Malta, Poland, Spain, Sweden, and The United Kingdom – applied accounting standards that were 75% or more aligned with IPSAS for their central government public sector entities. Information provided by IFAC member bodies, which report to IFAC on their jurisdictions' compliance with IFAC supported standards, identifies other countries that have adopted IPSAS, including Austria, The Cayman Islands, Chile, Guatemala, Peru, and Switzerland, while at least 21 countries further have partially adopted IPSASs. Public sector entities in New Zealand have applied IPSAS since 2014. The majority of international organizations apply IPSAS, including the OECD, all United Nations system organizations, the European Commission, and the North Atlantic Treaty Organization. IPSAS are treated as the starting point for development of European Public Sector Accounting Standards (EPSASs), which are expected to support improvement and harmonization of public sector financial reporting within the European Union.

IFAC, the World Bank, IMF, and the European Commission's Eurostat support IPSAS adoption on the basis that it can improve the financial information reported by public sector entities, with likely improvements to entities' financial management and financial sustainability. Eurostat has promoted IPSAS adoption for consideration by European Union countries because of the benefits that are expected to arise from better quality financial information as a basis GFS reports. IPSAS delivers most benefits when an entity moves from either cash-basis accounting or partial accrual-basis accounting to accounting fully on an accruals basis. A national jurisdiction that is already applying high quality accruals-basis financial reporting standards receives fewer benefits from IPSAS adoption.

## Conclusion

In conclusion, IPSAS is a comprehensive set of international accounting standards for public sector entities including national governments. Governments' adoption of IPSAS is increasing, encouraged by organizations such as the World Bank and the IMF. The IPSASB develops IPSAS. The IPSASB's membership, due process, and governance structure support the goal of high quality accounting standards that are developed in the public interest.

College; Internationalization of tertiary education; Post secondary education; University

## Introduction

Higher education is considered as an essential instrument for dealing with various national issues from improving the well-being of citizens to eradicating poverty. In the recent decades, international education has advanced into a means for international collaborations that can boost university rankings and build regional identity (University of Oxford 2015). The growth in the international component of higher education has led to a trend known as internationalization, which involves increasing cross-border geographic spread of activities (Knight 2008b; Kreber 2009). The phenomenon is central to the academic enterprise today, particularly in terms of planning for the future by policymakers and institutional leaders. In recent years, there has been ample evidence of the higher education sector going international: prestigious foreign universities setting up local campuses, dual- or joint-degree programs being established to internationalize the curriculum, and faculties seeking opportunities for collaborations on research projects from various cultural and national perspectives (Childress 2010). Internationalization of higher education refers to "the process of integrating an international, intercultural, or global dimension into the purpose, functions or delivery of higher education" (Knight 2004, p. 9), which includes a

broad range of activities including transnational mobility of students and staff, internationalization of curricula and quality assurance, interinstitutional co-operation in education and research, and the establishment of international university consortia (Van Vught et al. 2002). According to Fok (2007), the increasing mobility of students and the growing importance of English in the world have given a new level of importance to the notion of internationalizing the higher education sector. Even the universities in non-English-speaking countries such as Sweden, Singapore, Hong Kong, and China are joining the battle in attracting foreign students.

According to Lee (2014), many changes have been observed in the higher education sector since the 1990s, when it witnessed the process of "massification" or the rapid expansion of higher education with a significant increase in the numbers of students and degree-awarding tertiary institutions. First, there has been ever-growing social expectation on education outcomes by admitting more students and by producing a larger pool of well-educated and skilled manpower for socio-economic needs because of a global shift from industry-based to knowledge-based economies (Lee 2014). This has been paired with growingly marketized and privatized strategies to create education opportunities to meet the persistent demand for higher education (Mok and Han 2015), with a significant increase in public financial inputs on higher education, student population, and more diversified academic disciplines offered to prospective students (Lee 2011). In addition, Asian economies including Hong Kong have become more affluent and have therefore become keener on expanding university education to meet growing socio-economic needs (Lee 2011). Motivated by the concerns of brain gain and income generation, higher education institutions (HEIs) in the Asia-Pacific region have been expanding their higher education services beyond their territorial boundaries (Ng 2010).

Similar to the neighboring jurisdictions, Hong Kong is not immune from the global trend of higher education reform which aims at improving education quality and maintaining its relevance to socio-economic needs in the globalization era when market forces and competitions remain the core values (Lee 2014). Considering Hong Kong's strategic position at the "interface between Asia (more specifically, China) and the rest of the world" (University Grants Committee [UGC] 2010, p. 13), and being an "international intermediary" between East and West (UGC 2010, p. 50), Hong Kong offers an important context for any discussion of internationalization in the higher education sector (Skidmore 2012). This study seeks to offer readers an all-rounded view of the trajectory of how internationalization has developed and progressed in Hong Kong, to examine the approaches adopted by the publicly funded institutions in Hong Kong, to discuss the challenges facing the higher education sector in the world including Hong Kong, and to offer recommendations for further development of internationalization.

This work is systematized in five sections. Section "Recent Global Trends in Internationalization of Higher Education" focuses on the recent trends characterizing the phenomenon of higher education internationalization in the world. Section "Internationalization of Higher Education in Hong Kong" explores the internationalization initiatives undertaken by the publicly funded institutions in Hong Kong. Section "Problems and Challenges of Internationalizing Higher Education" highlights the major challenges facing the higher education sector in the world including Hong Kong. Section "Solutions and Recommendations" presents the solutions to the challenges and the way forward, and section "Conclusion" concludes this study.

## Recent Global Trends in Internationalization of Higher Education

After several decades of intense development, internationalization has grown in scope, scale, and importance. The recent trends of internationalizing higher education around the world are mainly characterized by privatization, regional institutional agreements or network memberships, increasing student mobility,

establishment of collaborative programs, and university rankings.

### Privatization

Private higher education is one of the most dynamic and fastest-growing segments of post-secondary education at the turn of the twenty-first century (Altbach 1999). According to many public universities have started offering self-financing programs. In addition, distance education that incurs relatively high fees has grown fast, and barring exceptions and fee levels have also increased in public higher education. Thus, the cost of higher education is continually shifting from government to households, resulting in privatization of public institutions (Agarwal 2007). As a matter of fact, the market-oriented profit-seeking private higher education has grown in the recent past at a rapid rate in both developing and developed countries. By 2025, it is forecasted that the demand for international education will grow to 7.2 million students – a quantum leap from 1.2 million students in 2000 (Bohm et al. 2002). While some of this demand is being met by student mobility, the number of new providers delivering programs to students in their home countries is accelerating at an unprecedented rate (Knight 2009). Among the new institutional players, many of them are new private sector providers. Today, some 30% of global higher education enrolment is private. In the past, private higher education existed mainly in East Asia countries, and it formed a small part of higher education in most countries. However, private higher education institutions which are mostly for-profit or quasi-for-profit now represent the fastest-growing sector worldwide. A disproportionately larger number of students are enrolled in private universities in developing countries than in most advanced countries (Tilak 2008). Private higher education in South Asia, like other parts of the world, has been the main venue of expansion of higher education system over the past two decades (Agarwal 2014). The trend suggests that privatization encompasses the rise of private universities, privatization of public institutions, and the exponential growth of for-profit institutions (Tilak 2008).

### Strategic Alliances Through Institutional Agreements

Institutions worldwide have been establishing partnerships with institutions in other countries to offer degrees and academic programs, develop research projects, and collaborate by way of networks, consortia, associations, and partnerships with businesses, formal cooperative agreements, and local communities (Sutton and Obst 2011). Such kind of strategic partnership is a formal alliance between two or more higher education institutions developed through an intentional process, whereby the partners share resources and leverage complementary strengths to achieve defined or common objectives (Kudar 2014). With the liberalization of foreign markets, state regulatory environments, and systems of higher education, the globalization and internationalization of higher education is being perpetuated by institutional agreements between local, state, and transnational organizations (Altbach and Knight 2007). The number of bilateral or multilateral education agreements has increased exponentially in the past decade (Knight 2004). Twenty years ago, partnerships were almost exclusively about student exchange (Sutton and Obst 2011). At present, the goals of exchange partnerships have multiplied, their geographical span has widened, and they have been supplemented with other forms (Sutton and Obst 2011). Such inter-institutional partnerships often involve academic credit sharing or complete degree earning programs, internship opportunities, or research activity (Sherrie and Leavitt 2015).

However, Knight (2014) also notes that some institutions tend to enter into a great number of regional institutional agreements or network memberships to make themselves more prestigious and attractive to other institutions and students, but they end up being difficult and unproductive to manage because the agreements require a major investment of human and financial resources from individual faculty members, departments, and international offices. As a result, a more recent trend is the paring down of the number of agreements to 10 or 20 institution-wide priority partnerships, which will help lead to more comprehensive and sustainable

relationships among faculty members and researchers (Knight 2011b).

### Increasing Mobility in the Academia

Another prominent trend of internationalization is the increasing mobility of students, academic scholars, programs, and institutions in the academia. The mobility of students and scholars has been a characteristic of higher education since the middle ages, but it was only in the late 1990s that the number of students studying outside their home country grew exponentially (Davidovitch 2015). According to OECD (2013), there were 1.8 million international students in the world in 2000. This number increased to 2.8 million by 2007 and passed the 4.5 million mark in 2010. It is estimated that the number of international students will rise to 7 million by 2020 (Rumbley et al. 2012). Students' mobility also comes with a significant number of academic scholars who relocate for brief or extended periods to teach in institutions outside their home country (Pherali 2012). A large number of academic scholars are teaching overseas (Altbach et al. 2009; Bodycott and Walker 2000; Pherali 2012). Collaborations involving institutions, international scholarship, and fellowship programs increase the mobility of academic staff who teach and conduct research outside their home country (Davidovitch 2015). In some cases, institutions in better-off countries recruit teaching staff from poor and unstable countries and offer them superior conditions for research and teaching, resulting in a situation known as brain drain (Altbach et al. 2009). Apart from the mobility of students and scholars, mobility in the academia also involves programs and institutions. Since the 2000s, there has been a significant increase in the number of extensions of parent institutions from western countries that operate in countries such as Dubai, Qatar, Singapore, and China (Dirlik 2012). There is a broad range of interinstitutional cooperation agreements, for example, the agreement between the University of Nottingham in the United Kingdom (UK) and the Zhejiang Wanli Education Group University in China, enabling the operation of the Nottingham-Ningbo University in China (Davidovitch 2015). There are also isolated programs or focused study disciplines that institutions make available overseas, jointly by two or more collaborating institutions. The trend of developing joint or dual programs between institutions is to be discussed in greater details in the following section.

Knight (2003) theorizes the trend by stating that within the framework of international higher education, there are four categories of "who and what" moving across borders: people, providers, programs, and projects or services. "People" refers to the cross-border movement of people, whether they are students, professors, scholars, experts, or staff for education purposes. "Providers" refers to the institutions or providers that have physical or virtual presence in the receiving country. Examples include branch campuses, stand-alone foreign institutions, and franchising arrangements. As for "programs," they move across borders and are delivered through a linkage or interinstitutional partnerships that can be commercial or noncommercial in nature. In some cases, this could involve a joint or double degree. "Projects or services" could be undertaken as part of academic linkages and commercial contracts. The movement of projects or services can foster joint curriculum development, research, benchmarking, e-learning platforms, and other capacity-building initiatives. Hence, in the framework of international higher education, people (students, faculty, and researchers) are internationally mobile, and academic programs are being delivered across borders with providers (including opening branch campuses and teaching centers overseas, off-shore or distance academic programs, and education hubs) being established around the world particularly in the Middle East and East Asia to complement traditional initiatives (Knight 2014; University of Oxford 2015). The mobility and international flow of students is typically from Asia entering the major academic systems of North America, Western Europe, and Australia (Agarwal et al. 2007), while it is the opposite direction for academic extensions and collaborative alliances (Davidovitch 2015). Motivated by the desire to maintain economic competitiveness and realize financial gains by enrolling full fee-paying internationals, many

Western countries such as the United Kingdom, Australia, and Canada have relaxed visa and immigration requirements to attract foreign students. Moreover, most international students prefer to study in English-speaking countries, which is reflected in the fact that three English-speaking countries – the United States of America (USA), Australia, and the UK – control 36% of the market of international students (Davidovitch 2015). In response to this trend, some universities in non-English-speaking countries have established degree programs in English to attract students overseas.

### Establishment of Collaborative Programs

Another recent trend of internationalizing higher education has been the establishment of joint or dual programs between institutions in two (or more) countries that lead to double (or multiple) degrees, and in some cases, a joint degree (Knight 2008c). A number of foreign universities have been invited by local governments to establish branch campuses overseas, for example, the University of Nottingham's campus in Ningbo, China, and New York University's branch in Abu Dhabi, UAE (University of Oxford 2015). That trend has continued, with universities beginning to move into previously untried territories to establish branch campuses and teaching centers. For instance, Lancaster and Strathclyde universities both signed an agreement in May 2009 to establish campuses in Pakistan (University of Oxford 2015). The hosting countries pay most of the costs associated with these arrangements. Institutions establishing branches or joint programs are often motivated by a desire for additional revenue, although they are also engaged in raising their international profile and contributing to the internationalization of their home campuses as well. The motivations of the receiving countries are perhaps more complex and include a need for greater capacity at home and a desire to leverage the prestige and resources of a high-quality foreign institution (Rumbley et al. 2012). As for the programs being delivered, Kudar (2014) points out that joint or double degree programs enjoy high priority on internationalization agendas of tertiary institutions. A survey on collaborative degree programs conducted in 2011 shows that 91% of 245 participating tertiary institutions confirmed that joint or dual degree programs were part of the institutions' internationalization efforts and strategy.

### Institutional Partnerships

International academic partnerships or strategic alliances are being asked to do more now than previously required. Twenty years ago, partnerships were almost exclusively about student exchange, with only occasional occurrences of collaborative research, cooperative capacity-building, or community development. While exchange partnerships continue strong, their goals have multiplied, their geographical span has widened, and most importantly, they have been supplemented with other forms. Such academic partnerships also employ a wide range of methods and strategies to achieve their goals. Some develop short-term, deeply embedded study abroad programs that attract a wider range of students than those who study overseas for the whole year. Some use international faculty, laboratories, and internships to introduce international learning to curricula in the professions and STEM fields. Dual degrees and joint educational programs have emerged that foster blended cohorts of students from different nations. Information technology and social media are used to create globally interactive classrooms. International research teams compare perspectives and pool in resources to explore questions of mutual interest, while similar teams collaborate on community development and institutional capacity building, such as spreading the community college system and introducing innovative modes of English language instruction (Sutton and Obst 2011).

### University Rankings

Another prominent trend of internationalization of higher education is the greater attention being paid to rankings and institutional positioning. Sursock (2015) refers the 2015 Trends responses and remarks that the importance of ranking schemes and league tables is growing and that

this trend is expected to continue. As a matter of fact, international and regional rankings of universities have had a major impact on all stakeholders in the knowledge services industry (Marginson 2007). University rankings are measured according to a global scale and therefore introduce the notion of competition among university rankings as a new paradigm in most countries (Altbach 2006). Ranking lists focus not only on universities as a whole, but also on various arenas of activities such as research, teaching or executive education, and curriculum content. However, all ratings and rankings of institutions assume that there is a brand effect for the university as a whole. Moreover, despite the great debate about their validity and reliability, rankings have become relevant tools for institution policy makers. The classifications are used by individuals to compare places to study and increasingly by governments to make funding decisions. Indeed, the measurement of internationalization is conceived as the achievement of a specific position in one or more of the global rankings. Hence, university rankings play a key role in the current education market, the harmonization of educational standards, and high student and faculty mobility, among other aspects (OECD 2009).

## Internationalization of Higher Education in Hong Kong

Hong Kong has joined the competition for speeding up the process of internationalization of higher education since the colonial period, and the city is keen to sustain such a policy after handover. In fact, internationalization of higher education has become one of the key strategic plans for Hong Kong's publicly funded universities to enhance their global competitiveness. Internationalization has been embodied in the significant rise of the number of nonlocal or international staff and students in the eight publicly funded universities in Hong Kong. The number of nonlocal students had grown fourfold from 2003 to 2013 (Lee 2014). As many as 45% of the University of Hong Kong's (HKU) academic staff were drawn from overseas (Fok 2007). Besides, about 10% of the undergraduates at the Hong Kong University of Science and Technology (HKUST) are nonlocal students, and HKUST is planning to lift the admission rate of nonlocal students to 20% (Tam 2012). In addition, Hong Kong's universities offer scholarships and subsidies in order to recruit elite students. Another apparent activity to promote internationalization in the city is the setting up of joint university agreements. For instance, HKU was a founding member of Universitas 21 (U21), a strategic network of international research-led universities that works proactively to encourage academic exchanges, facilitating international collaboration between members, and focusing on opportunities for entrepreneurial activities (Fok 2007). Another aspect of internationalizing higher education in Hong Kong is the restructuring of the curriculum structures through the introduction of the credit-based system since 1998, and the introduction of the 4-year university system in 2012 (Fok 2007; Lee 2014). On top of these initiatives, the University Grants Committee (UGC) has set up a matching grant called "UGC Block Grant Student Activities Fund" to call for joint efforts among local institutions toward deepened and more effective internationalization to attract students worldwide. Once allocations are approved, institutions have a high degree of freedom in deciding how the available resources are best put to use.

These developments suggest that Hong Kong's higher education sector has undergone waves of changes including greatly increased diversity among students ("massification"), entrepreneurial management ("marketization"), and interpreting and assessing activities and results predominantly based on economic criteria ("commodification"). In the 1990s, several postsecondary institutions were upgraded to universities (Lo and Ng 2003). Since then, the Hong Kong Government has proactively sought to internationalize the higher education sector so as to develop the city into a regional education hub and Asia's world city (Fok 2007; Skidmore 2012). Following the internationalization of higher education trend, the former Chief Executive Tung Chee-hwa set a target

of increasing the participation rate of tertiary education to 60% by the 2010/2011 academic year and raising the number of nonlocal research students from one-fifth to one-third (Lo and Ng 2003). Tung's successor Tsang Yam-kuen continued the policy by taking educational services as one of the six pillar industries serving to boost Hong Kong's competitiveness (Lo and Ng 2003). Another report "Aspirations for the higher education system in Hong Kong" published by the UGC in 2010 identifies Hong Kong's position as a bridge between cultures (Skidmore 2012). The report further emphasized an integration of international students with local students at the campus level and maintenance of an international mix of the faculty in universities. Likewise, visa and enrolment restrictions have been relaxed to attract a greater number of international students. Such initiatives include allowing international students to work for one year post graduation and to undertake paid "summer" jobs and "on-campus" employment of up to 20 h per week (Hong Kong Immigration Department 2015). Aside from policy changes, international institutions have been encouraged to set up campuses in Hong Kong. One example is the Savannah College of Art and Design (SCAD), which began offering classes from the former North Kowloon Courthouse in 2010 (Clark 2011). In addition to the new SCAD campus, Upper Iowa University and Chicago's Booth School of Business opened a site in Hong Kong (Clark 2011; Lee 2014). Likewise, the Chinese University of Hong Kong (CUHK) set up its first branch campus in Shenzhen in September 2014, and HKU established the HKU-Shenzhen Institute of Research and Innovation in 2011 and HKU-Zhejiang Institute of Research and Innovation in 2012 to promote hi-tech research and development, knowledge transfer, and industry incubation. All these developments demonstrate a fundamental change of character of higher education in Hong Kong, which is not just a public good to be guaranteed by the government, but also a commodity for economic exchange (Lee 2014).

The eight publicly funded universities in Hong Kong are launching a number of initiatives to go international. Table 1 below classifies their internationalization efforts as inbound and outbound and highlights the features of such initiatives.

## Problems and Challenges of Internationalizing Higher Education

While internationalization has opened new opportunities, it has also reinforced and reproduced unequal divisions in the political economy of global education (Zelera 2012). In general, it has been said that internationalization has engendered intense pressures for institutional competition and collaboration, convergence, and fragmentation within and across national higher education systems (Bleiklie 2005; Powell and Solga 2008). Cross-border education also raises serious questions about quality control, the development and enforcement of quality assurance mechanisms, and transferability and recognition of qualifications. The most significant challenges are discussed in the following sections.

### Commercialization of Education

The rapid growth in private higher education in recent years is associated with a few major issues. Firstly, an issue is the significant shift from philanthropy to profits in setting up private institutions. The global trends suggest that private higher education characterized by philanthropy is mostly replaced by profit-seeking private higher education (Tilak 2008). Besides tuition fees, public institutions see income from research funds, income from the sale of institution-related products, consulting and research services, and institution-industry linkages. In some cases, such financial sources contribute to commercialization of higher education (Knight 2006; Rumbley et al. 2012). Capital and talent are attracted to wealthy countries and prestigious institutions, and citizens with the financial and academic capabilities leave weak countries in favor of strong countries. Considering the mostly unilateral direction of foreign students, internationalization of higher education undermines a more equitable distribution of resources in the world (Davidovitch

**Internationalization of Higher Education in Hong Kong: Policies, Development, and Emerging Trends, Table 1** Overview of Internationalization of Higher Education in Hong Kong

| Tertiary institution | Inbound and outbound internationalization initiatives and features |

Source: Official websites of the institutions; Shin and Kehm 2013

2015). A study conducted in 2004 revealed that 80% of all Chinese and Indian students who study abroad do not return to their home country immediately after they complete their degree (Altbach 2004). All in all, the rapid growth of private higher education and commercialization of higher education have resulted in the acceptance of the idea of higher education as a private good that benefits the students only, replacing the classical notion of higher education as a public good that benefits the whole society (Tilak 2008).

## Comparability of Qualifications

The comparability of educational qualifications has become a key issue in international discussions. In accordance with Knight (2015), the differences in national and university regulations, regulatory systems, and customs among countries have presented challenges for the design and implementation of international collaborative programs, with regulations preventing students from enrolling in more than one university at a time, laws requiring students to spend their last year or

semester at the home university, or practices mandating the recruitment and selection of students. Nonrecognition and limitations on the number of courses or credits taken at a partner university raise additional barriers. Dissimilar academic years can create problems for student mobility. Evaluation requirements and procedures often present obstacles to double-degree programs.

### Quality Assurance and Accreditation

With many new providers offering more options for higher education, it is sometimes difficult to distinguish legitimate institutions from diploma or degree mills that make credentials available for purchase (Rumbley et al. 2012). One of the most important challenges in cross-border education is how to ensure the quality of academics and to achieve the legitimacy of what qualifications are awarded and whether the institutions, companies, and organizations are recognized by the receiving country. According to Knight (2008a), there is an increase in low-quality providers who are not recognized by bona fide accreditation/licensing bodies in either the sending or the receiving countries. Furthermore, there are often simply web-based companies that are selling certificates based on "life experiences" and are not delivering any education programs. Therefore, the growing importance of internationalization of higher education calls for an assessment of the quality of internationalization at the program and the institutional levels and a system of certifications (De Wit 2010).

### Questionable Adaptions

Joint programs are intended to provide a rich international and comparative academic experience for students and to improve their opportunities for employment. However, one of the consequences is the potential for misuse or abuse of degree granting and recognition protocols, resulting in questionable adaptations. In accordance with Knight (2014), in some cases, "double degrees can be nothing more than double counting one set of course credits." While it may be very attractive for students to have two degrees from institutions in two different countries, the development is moving toward the thin edge of academic fraud if course requirements for two full degrees are not completed. It is particularly difficult to regulate new providers of higher education services if they are not subject to quality assurance schemes (Zelera 2012). Also, in many countries, national frameworks for quality assurance for cross-border higher education are not well developed and international cooperation between quality assurance agencies is limited. In many developing countries, regulatory systems are not sufficiently developed to ensure robust evaluation standards.

### Newness of International Partnerships and Other Challenges

There are many difficulties derived from the relative newness of international collaborations. Administrators, fiscal officers, and faculty need to be convinced of the value of this new form, avenues of support must be identified, and procedural and structural barriers must be addressed (Sutton and Obst 2011). Apart from the concept of international collaborations being new to academic staff, other challenges include funding difficulties, online delivery of degrees, the possible rise of a small set of dominant global universities, and significant differences in educational resources across nations (Sutton and Obst 2011). Those issues have intensified the tension between institutional advancement and collaborative advancement in international partnerships. Moreover, international partnerships that involve student exchange are often unbalanced, with fewer US students going out than their counterparts entering the country. Meanwhile, there have been a number of high profile closures of free-standing and primarily self-funded branch campuses because of economic and political uncertainties and loss of government support. In most cases, the reason for the closures has been related to economic and political changes or falling enrolment numbers, while others have been impacted by a changing government policy and the withdrawal of financial support by the host government (University of Oxford 2015). For instance, University College London withdrew from its Australian campus after economic and political challenges led to a change in Australian

government policy and a subsequent loss of support (University of Oxford 2015). In addition, some universities have faced domestic opposition from faculty members and administrators because of concern that focusing on developing campuses overseas would weaken the education provided at the home campus. For instance, Yale University and New York University faculty have expressed dissent at overseas expansion plans (University of Oxford 2015). Additionally, it is questionable whether internationalization can ensure successful academic experiences for international students (Guo and Chase 2011). Empirical research has found that international students tend to feel being isolated, alienated, or marginalized at times because they fail to integrate into the local academic environment (McClure 2007; Ryan and Viete 2009).

## Solutions and Recommendations

The United Nations Educational, Scientific and Cultural Organization (UNESCO) came up with a number of recommendations or guidelines in 2005, targeting six stakeholders including higher education institutions, student associations, quality assurance and accreditation agencies, recognition agencies, academic staff associations, professional bodies, the private sector, and other international organizations, to ensure provision of quality cross-border higher education (UNESCO 2005). Some of them are to be discussed under this section. They can be broadly categorized into national and institutional levels.

### National Level

On the national level, UNESCO takes the view that governments should establish, or encourage, the establishment of a comprehensive, fair, and transparent system of registration or licensing for cross-border higher education providers, and encourage the establishment of a comprehensive capacity for reliable quality assurance and accreditation of cross-border higher education provision. In addition, governments should provide accurate, reliable, and easily accessible information on the criteria and standards for registration, licensure, quality assurance, and accreditation of cross-border higher education. Where appropriate, bilateral or multilateral recognition agreements should be developed to facilitate the recognition of each country's qualifications based on the procedures included in mutual agreements.

### Institutional Level

On the institutional level, higher education institutions/providers delivering cross-border higher education should ensure that the programs they deliver across borders and in their home country are of comparable quality and that they also take into account the cultural and linguistic sensitivities of the receiving country. Furthermore, the current internal quality management systems should be developed, maintained, or reviewed so that they make full use of the competencies of stakeholders such as academic staff, administrators, students, and graduates and take full responsibility for delivering higher education qualifications comparable in standard in their home country and across borders. Good practices should be shared by participating in sector organizations and interinstitutional networks at national and international levels. Moreover, networks and partnerships should be developed and maintained to facilitate the process of recognition.

Considering the strategic and substantive importance to recognize the roles and responsibilities of all the players involved in accreditation and quality assurance, all stakeholders should contribute to ensuring the quality of cross-border education. As for rogue providers or fraudulent qualifications closely linked to cross-border education, it will be important to work in a collaborative and complementary fashion to build a system that ensures the quality and integrity of cross-border education and maintains the confidence of society in higher education (Knight 2008b). Several initiatives to develop tools and instruments for measuring internationalization have been taken in different countries over the past years. Broadly speaking, there are four major approaches: general accreditation, specialized or profession accreditation, audit or review, and quality assessment. Most of the instruments fall in the category of audits and reviews. Most

combine self-assessment with external peer reviews and some have an award incentive attached to it. Benchmarking is another instrument that is used in assessing the quality of internationalization. Comparison and identification of best practices are two additional elements that form key aspects of benchmarking exercises, and the exercise itself also focuses on improvement. Also for benchmarking, a list of measurable performance indicators are required. To promote competition among universities, performance-based funding mechanisms can be developed in the higher education sector, so that the allocation of public funding is linked to the adoption of quality assurance and performance indicators. The application of business principles and practices in university administration will encourage tertiary institutions to better themselves in order to stay competitive for revenues and resources. Locally, there are a few initiatives implemented based on such principles. One example is the General Research Fund under the Research Grants Council, which is part of the University Grants Committee (UGC), is a competitive funding scheme that enables academics to compete for research funds based on their track records and the originality, merit, contribution, and significance of their research projects. On the topic of academic frauds, UNESCO published the Guidelines for Quality Provision in Cross-border Higher Education, which seek to assist providers and recipients to overcome the challenges arisen from academic frauds.

## Conclusion

Since the 1990s, the Hong Kong Government has visibly emphasized on the policy and strategies on internationalization of higher education, which has led to be more entrepreneurial and business-like (Lee 2014). The publicly funded universities in Hong Kong have made efforts to internationalize their campuses and their curricula, by incorporating various approaches from restructuring of the curriculum through the introduction of the credit-based system to the introduction of the 4-year university system along with partnering with institutions overseas. Collaborative degree programs show that tertiary institutions having joint or dual degree programs were part of the institutions' internationalization efforts and strategy. As Clark (2004) remarks, the future of universities denotes the transformation towards the direction of "entrepreneurial universities," where "entrepreneurial" in the context of higher education refers to "the attitudes and procedures that most dependably lead to the modern self-reliant, self-steering university" (Clark 2004, p. 7). More so, internationalization has created intense pressures for institutional competition whether it is collaboration or convergence across national higher education systems which has indeed evidently brought in new challenges for sustainable quality.

# Internationalization of Higher Education Policies in IRAN

Ghasem Salimi and Mahboobe Mehrvarz
Faculty of Education, Shiraz University, Shiraz, Iran

## Synonyms

Internationalization of higher education; Iran; Policies; Strategies

## Definition

The internationalization of higher education is the process of integrating the international, intercultural, and global dimensions into goals, functions (teaching, research, and services), as well as the transfer and implementation of higher education, in a way that promotes respect for cultural differences and various traditions.

## Introduction

Today, universities are faced with a large number of requirements and challenges (Buchem et al. 2018) and have been increasing their international activities for the past two or three decades in order to become more competitive both domestically and globally (Altbach and Knight 2007). Because today, the internationalization of higher education is a strategy and selective policy for the proper exploitation of globalization processes (Knight 2007). Thus, internationalization is no longer a marginal or minor part of higher education. Rather, most higher education institutions use it as a part of their visions and strategies (Bruhn 2016; Knight and de Wit 2018; Mehrvarz et al. 2019).

The internationalization of the higher education system can result in a lot of positive consequences. For instance, this process can lead to the development of intercultural communication skills and education for the global citizenship

(Appiah-Kubi and Annan 2020). Furthermore, positive outcomes and results of the internationalization of higher education are as follows: transferring technology and strengthening diplomatic relations (Tremblay 2005); economic growth and development, income generation and expansion of labor market and higher education market (Idris et al. 2012); opportunities to attract foreign elites and brains, an increase in international cooperation, and improving research and scientific production (Knight 2007).

Internationalization can be associated with the phenomenon of brain drain and brain absorption (Valtins and Muracova 2019). This means that on the one hand internalization has brought about phenomenon of brain drain for poorer countries which are less stable. On the other hand, it has led to the phenomenon of brain absorption for more developed and industrialized countries. Consequently, the internationalization of higher education can attract talent and human capital and help facilitate and reinforce the more effective presence of students and faculty in various scientific, social, and economic fields. The question "why de higher education institutions seek internationalization?" has initiated structural attention to it, and it seems necessary to examine the various rationales for the internationalization of higher education, given that each rationale needs to examine its own context (Bradford 2015).

In recent years, governments have adopted various and mostly practical and successful policies and strategies in order to internationalize higher education. Because governments are aware of the importance of universities in supporting national and regional competitions. Iran is no exception. In order to be concurrent with progress and global scientific and research trends, this country requires the use of strategies and policies to internationalize higher education. In line with these goals, the present study aims at answering the following questions:

- What have the policies of the past decade been? And what is the current strategy for the internationalization of higher education in Iran?
- What are the problems facing the internationalization of higher education? And how can they be directed and managed?

## The Concept of Internationalization Policies of Higher Education

Reports and research studies on the goals of international higher education reveal that political systems, policy makers of higher education, and university management consider various goals and strategies of internationalization. Crăciun (2018) states that looking at the publication years of these studies shows that strategic thinking about the internationalization of higher education is a new phenomenon which should be considered more. Yet, 80% of countries around the world have no strategy or policy to internationalize their higher education. In fact, only 11% of countries, or in other words, 22 out of 195 countries have a formal strategy in this area.

De Wit (2011), Knight (2015), and Bradford (2015) highlighted that the goal or rationale of internationalization is selected according to the existing demands, needs and conditions, and these different rationales have different concepts and functions in internationalization. Therefore, initially the strategy and policy of internationalization of education system must be specified. A number of institutions may use the policy of collaborating with other countries and participating in global and regional networks in order to become international, while others may only consider the students and faculty members factors. Some pay attention to the establishment and development of their research and teaching centers in different parts of the world, whereas others pay attention to the intercultural dimensions of internationalization.

In order to be able to develop a comprehensive model for the internationalization of higher education based on its cultural, political, economic conditions, countries need to pay attention to their historical, cultural, and traditional backgrounds and roots. In other words, European countries with traditions and different higher education models will not have the same model as countries

such as the United Kingdom, the United States, Canada, and Australia (Wu and Naidoo 2016).

Therefore, cautious actions need to be taken in the path of internationalization. Each international program, while getting internationalized, must reflect the characteristics and expectations of indigenous society. Since following the process of internationalization and the ruling ideology without developing its own unique systems and respecting national traditions and cultures may easily make us involved in the decolonization process (Wu and Naidoo 2016). In general, the strategies or policies of universities and higher education institutions in internationalization can be divided into five sets of "economic," "educational- curriculum," "socio-cultural," "political" (Knight 2015), and "organizational" goals and motivations (Seeber et al. 2016).

## The Policy of Internationalization of Higher Education in Iran According to Strategic Documents

The law of the Sixth Five-Year Plan for Economic, Social and Cultural Development of the Islamic Republic of Iran (Horizon 2025) explicitly emphasizes the expansion of scientific relations with reputable international educational and research centers and institutions. It is explicitly stated in a part of the law that "The government is allowed to establish higher education units and branches with the participation of reputable international universities and institutes of higher education as well as Iran's universities, higher education institutions, research and vocational centers and the scientific-applied university in order to promote science and competition between the country's universities and international interactions during the implementation of the program law."

It is also stated in a part of this law that the government is obliged to participate in educational and research activities at the international level in order to have an effective presence of the country's higher education system in the production, development, and dissemination of science and technology. The following are some of the perspectives of these activities in 2020:

- Increasing the number of foreign students in universities
- Adjusting the ratio of students to full-time faculty members
- Increasing the number of Asia's top universities to 10
- Increasing the number of foreign branches of the country's universities
- Increasing the per capita number of internationally recognized articles to the number of faculty members
- Increasing the percentage of joint papers with foreign researchers to 35%
- Increasing the number of publications indexed in international science databases and having a high impact factor

In terms of approaches and goals of internationalization, Iran's top universities in recent years have allocated projects as their guide and policy in this field. One of these projects is called "Converting the top 5 universities and research centers in the country to the International level in the national program of knowledge-based economy," which started in 2016. In fact, this project has already formed to "promote international higher education in Iran" and generally supports the following goals and programs:

- Increasing the competitiveness and interactions of universities and institutions of higher education, research and technology at the international level
- Effective presence in international scientific, educational, and technological interactions and collaborations
- Establishment and empowerment of advanced and up-to-date research laboratories in selected universities and research institutes

This project has already been accompanied by serious and annual financial support as well as the guidance and supervision of a committee of experienced and capable scientists in the country, which seeks to create a serious monitoring structure based on global models and with the help of scientific associations of 2016. It provides the necessary mechanism in selected universities and

research institutes to compete in the global arena over the next 10 years until 2025 (Ministry of Science, Research and Technology 2018).

## Problems Facing the Internationalization of Higher Education in Iran

Various studies have discussed some of the problems and issues in the internationalization of higher education in Iran. The examination of the reports and related documents shows that considering educational and research activities and services as the international dimension has increased. Nikbin et al. (2017) mentioned in a research that international collaborations, joint international research projects, international communication and research skills development, sabbaticals or study opportunities and student exchange programs are the activities which have been most emphasized in the documents.

Moreover, some studies and reports show that the comprehensive policy and special strategic orientation have been adopted or implemented by neither the Ministry of Science, Research, and Technology nor by Iranian universities (Khorsandi taskoh 2015). It only mentions some components of Internationalization in policy plans without presenting a practical plan for its implementation (Nikbin et al. 2017). In addition, no national programs were devised to explain and clear the role and position of international higher education in the regional-national development (Hoseini Moghadam 2019). These issues and the lack of macro- and comprehensive policy-making have made Iran move towards the internationalization of higher education slowly.

Some researchers consider the lack of attention to the cultural dimension in the internationalization of higher education as another issue in the internationalization of higher education. According to Firoozjaeian and Khorsandi taskoh (2018), the lack of intercultural openness approach in the communication patterns of society, lack of attention to intercultural planning in the adoption of educational policy, and lack of attention to intercultural issues in the educational mission are considered as issues of internationalization of higher education in the country. Therefore, it is better to pay more attention to approaches to preserve the cultural identity of universities and also to create a suitable platform for the spread of rich Iranian-Islamic culture and prevent the occurrence of national identity crisis (Nikbin et al. 2017). Hoseini Moghadam (2019) argued that the dominance of the top-down governing in the country over the past decades is the main issue facing the internationalization of higher education, and Firoozjaeian and Khorsandi Taskoh (2018) consider the lack of financial and material infrastructure and appropriate facilities and convenient educational space as issues facing the higher education internationalization.

## Conclusion

The examination of reports related to internationalization policy-making in Iranian higher education shows that educational, research, and collaboration activities of universities as well as study opportunities and student exchange are among the items mostly emphasized by Iran's higher education (Ministry of Science, Research and Technology 2018). As one of the countries in the Middle East, with 18 top universities in the list of the Times Higher Ranking System, Iran has been ranked second in the region based on the number of top universities after Turkey having 22 universities. On the other hand, although Iran's top universities have performed well in education, research, and study opportunities for students, an overview of the performance of Iran's top universities indicates that an important challenge is the low presence of these universities in attracting international postdoctoral fellowships, establishing joint off-campus branches in addition to holding various joint university courses with international higher education institutions. Decentralization in the international affairs of universities and assigning more authority and freedom to the top universities can facilitate internationalization in the country's universities. On the other hand, regarding cultural and intercultural concerns in the internationalization of higher education can

accelerate the process of internationalization of higher education in Iran. Hence, the policy of internationalization of higher education must be considered as an important component of institutional culture. The path is clear and internationalization of higher education will provide valuable opportunities for Iranian universities.

# Internet Governance

Mauro Santaniello and Francesco Amoretti
Department of Political, Social and Communication Sciences, University of Salerno, Fisciano, SA, Italy

## Synonyms

Internet policy; Net governance; Network governance

## Definition

The concept of Internet Governance refers to a heterogeneous set of policy processes concerning the configuration, management, coordination, and development of the Internet.

## Introduction

The Internet is increasingly turning into a crucial asset of contemporary societies. A huge amount of political, economic, social, and cultural processes deeply rely on this global, multipurpose infrastructure. Trade, finance, commerce, banking, and logistics are now strictly depending on online transactions. Strategic facilities like water, oil, food, and power distribution are reliant on digital networks for their control and functioning, as well as flights, public transportation, health services, traffic lights, cars, security systems, and common electrical appliances. Social relations are more and more network mediated as around 40% of the world population use the Internet on a regular base and more than 25% have an active account on a single social network, Facebook.

Furthermore, institutional functions and political processes in all democratic countries are increasingly migrating online, urged on by e-government, digital democracy, and open government programs. Cultural artifacts such as books, music, cinema, TV, and radio programs regularly turn to digital environments for both their production and distribution, and knowledge is more and more transferred in digital form. The Internet deeply innervates contemporary societies, and these in turn have to face a number of urging questions: How is the Internet governed? Who does make decisions affecting the way the Internet works? What kind of decisions are made and through which kind of decision-making? Around these questions, a cluster of public issues emerges, activating a multidimensional field of policy within which a complex and heterogeneous set of agents – both human and nonhuman – interact, cooperate, coalesce, and struggle. Internet Governance is a new policy area constituted of a galaxy of interconnected arenas, deliberating on interconnected collective problems. Within these arenas, decision-making processes proceed at different speeds and scales, take on multiple forms, and involve public and private authorities, individuals, and organizations; local, international, and global institutions; and human and software agencies.

## State of the Art

Much of the scholarly on Internet Governance (IG) have focused on the historical evolution of the Internet, in order to highlight how governance models have varied over time. Researchers commonly agree on the identification of three distinct chronological stages of IG: the technical regime, the self-governance order, and the multistakeholder model (Hofmann 2007). A technical regime has emerged quite spontaneously in the making of the early Internet, approximately from the 1960s to the end of the 1980s. In their building of the Internet, the community of the founding fathers adopted an informal, pragmatic, horizontal, and open approach to the governance of networks (Castells 2001). Informality refers to the specific form of decision-making adopted by the early Internet community and, at a later time, by the first Internet institutions such as the Internet Engineering Task Force (IETF) and the Internet Assigned Numbers Authority (IANA). Within these contexts, decisions are made through informal discussions held on mailing lists and meetings and with no formal voting procedures. This arrangement is referred to as "rough consensus," and it is often presented together with another principle, "running code," which highlights the pragmatical orientation of decision-making toward technical issues and problem-solving (Clark 1992). Horizontality concerns the absence, or the limitation, of organizational hierarchies in contexts where personal reputation and expertise are much more appreciated than roles and formalized responsibilities. Finally, openness refers to the fact that these kinds of arenas typically envisage no formal membership nor membership requirements, and their deliberative processes are easily accessible both to members and

nonmembers. The functioning of this governance model is well exemplified by the Request for Comments (RFC), which consists of a technical public document used to propose Internet standard innovations and changes and which undergoes a peer-review process until consensus on the proposal is reached. It is worth noting that the emergence of a regime characterized by the abovementioned features was allowed by the concomitance of different historical conditions: the small number of people initially involved both in Internet development and its usage, the cultural and professional homogeneity of early technical communities, the abundance of economic resources mobilized by the US government in order to advance information and communication technologies, and the focus on technical issues in an experimental environment (Ziewitz and Brown 2013). During the 1990s the US government launched a vast program encompassing the commercialization of the Internet and the privatization of its governance, which deeply transformed the cultural, social, legal, and political context (Goldsmith and Wu 2006; DeNardis and Raymond 2013; DeNardis 2014). A private order was put in charge to guide the development of an international, mass Internet. Under the insignia of the "self-regulation," private corporations were appointed as the driving force of Internet development, allowing the US government to deal with juridical subjects more accountable to the US authorities than an informal group of computer scientists and engineers and, on the other hand, to prevent other national governments and intergovernmental organizations from aiming at being included within decision-making on Internet standards, protocols, codes, and interconnections. The newborn private order was embodied by a controversial Internet institution, the Internet Corporation for Assigned Names and Numbers (ICANN), established in 1998 in California. ICANN inherited the IANA's functions, previously performed by a single computer scientist, Jon Postel, namely, the assignment of top-level domain names (TLDs, such as .com, .org, and .net), the allocation of numeric addresses (IP addresses, such as 193.205.160.20), and the management of some centralized databases containing the correspondences between names and numbers (Domain Name System root servers). ICANN operated the IANA function under contract to the National Telecommunications and Information Administration (NTIA) of the US Department of Commerce. Beside this tie with the US government, ICANN has been subject to many international disputes also for its own internal governance structure, as well as for its performance in terms of transparency, inclusiveness, legitimacy, and accountability. The issue became the hot topic of the first World Summit on Information Society (WSIS), a UN-sponsored meeting held in Geneva in 2003 (Mueller 2010). Given the high level of conflict around IG, the UN Secretary-General decided to establish a Working Group on Internet Governance (WGIG) in order to develop a working definition of Internet Governance, to identify the set of public policy issues at stake, and to develop a common understanding of the respective roles of different stakeholders. Relying on the work of the WGIG, during the second phase of the summit, held in Tunis in 2005, a statement (the Tunis Agenda for the Information Society) was adopted by consensus, an ad hoc forum for global policy dialogue (the Internet Governance Forum, IGF) was established, and a common definition of Internet Governance was advanced. The Tunis Agenda stated that:

> The international management of the Internet should be multilateral, transparent and democratic, with the full involvement of governments, the private sector, civil society and international organizations. (WSIS 2005, art. 29)

Similarly, the IGF was conceived as a multistakeholder forum, meaning that all relevant stakeholders (governments, business, technical and academic communities, civil society) were entitled for participation. The same orientation toward a wider participation in IG processes was recalled by the working definition proposed by the WGIG and adopted by the WSIS:

> Internet governance is the development and application by governments, the private sector and civil society, in their respective roles, of shared principles, norms, rules, decision-making procedures, and programmes that shape the evolution and use of the Internet. (WSIS 2005, art. 34)

Multistakeholderism, with its expanded participation, is currently the dominant IG model, extensively referred to as the standard model of deliberation by many organizations dealing with Internet-related policy issues. For instance, it is the model embraced by the so-called IANA transition. Indeed, on 14 March 2014, NTIA announced its intent to end the US government oversight over ICANN, transitioning the stewardship of IANA functions to the "global multistakeholder community." After a long-lasting process of consultation, ICANN's proposal was accepted by NTIA and took effect from 1 October 2016, freeing ICANN itself by any tie with the US government. ICANN adopted a particular kind of multistakeholderism, where coordination and management of the Internet's unique identifiers are entrusted to the private sector and an advisory role is assigned to other stakeholders. The output of the IANA transition, as well as the purely informational status of the IGF, has fueled further contestation against the multistakeholder model (Brousseau and Marzouki 2015), often pointed at as a way of preventing an effective policy change and preserving a US-centered private order (Lewis 2014). At the international level, these controversies have led to several struggles, of which that triggered at the World Conference on International Telecommunications (WCIT) held in Dubai in 2012 is one of the main. As a result of the intergovernmental conference, a majority of 89 states followed a coalition led by the Russian and Chinese governments and signed the new International Telecommunication Regulations (ITRs) which went into force on 1 January 2015 and remained unsigned by the USA and Western countries (Chenou and Radu 2014).

## Main Issues and Actors

Historically, the management of the Critical Internet Resources (CIRs) has been the most debated IG issue. CIRs are commonly understood as the set of centralized resources – protocols, systems, data – which makes the Internet work as a voluntary-based network of networks. A narrow definition of CIRs involves domain name servers, IP addresses, and DNS root servers; a broader view includes also infrastructural resources such as information backbones and their interconnection points (Internet Exchange Points, IXPs). Besides the abovementioned controversies concerning DNS, new geopolitical, legal, and political disputes are increasingly emerging around Internet infrastructural resources, as they come to be manipulated by political and private actors to perform features which do not concern the good functioning of the Internet. This process, described by researchers as "the turn to infrastructure" or "governance by infrastructure" (DeNardis and Musiani 2016), is often aimed to the enforcement of national laws, to the enactment of security policies, to the protection of intellectual property rights. That of Intellectual Property Rights (IPRs) is another well-established IG issue. It has informed the early debate on domain names, in terms of trade mark protection against the so-called cybersquatting, a practice that involves the abusive domain name registration of a company name. Piracy, illegal download, and file sharing are other typical controversies around IPRs, often involving the liability of ISPs, platforms, and content providers. IPR limitations, such as the fair use of copyrighted works and the right to access to knowledge, are debated topics as well. Another important IG issue is privacy. The Internet, and more generally digital technologies, has provided national governments and private corporations with effective tools to track, collect, process, and use personal data of individuals. The involvement of Western governments in mass surveillance programs through the Internet has been disclosed by several leaks since the revelations of Edward Snowden in 2013. On the other hand, many IT corporations, including search engines, platforms, and social networks, have based their successful services on user surveillance and profiling. Similar questions have emerged for what concerns civil liberties (and above all freedom of expression) and human rights, which constitute another group of issues usually involved in Internet Governance. Cybersecurity is rapidly emerging as a crucial issue in IG, involving strategical questions which can be conceptually divided into three groups. The first one is related to the security

of the Internet, to its reliability, its protection from cyberattacks, malware, and resource abuse. A second set of questions concern users' security on the Internet, the protection of individuals and organizations from cybercrime, fraud, identity theft, etc. Finally, policy problems arise from the use of the Internet for security purposes. State-sponsored hacking is an increasing phenomenon both at the domestic level, for investigation or surveillance aims, and at the international level as a part of cyber-warfare and cyber-espionage operations. Cybersecurity is also the field which presents the fastest rate of institutionalization both at the national level, as testified by the growing number of dedicated public agencies all over the world, and at the international level, with conferences and treaty such as the Budapest Convention on Cybercrime. According to the kind of issue at stake from time to time, a variety of state and non-state actors are involved, and their decisions codetermine both what the Internet is and what it is possible to do with it in a given historical moment. Each actor presents specific regulative resources and is usually involved in multiple policy networks, in a variable geometry of central and marginal positions in different policy arenas. Among the most powerful actors in IG, there is a large group of corporations, including software houses, hardware manufacturers, telecommunication companies, network operators, content providers, Internet Service Providers (ISPs), search engines, platforms and social networks, which are able to condition the common experience of the Internet with their own policies and practices, their agreements and contracts, and licenses and terms of service and with their decisions about design, architecture, and market prices. Moreover, a growing tangle of public authorities continuously establish Internet-related laws, procedures, and public policies at local, national, and international level. This set includes local and national governments, parliaments and parties, intergovernmental organizations, international organizations, national and international courts, regulatory authorities and governmental agencies, the police, the army, and secrete services. An important role is exerted by epistemic communities, such as the technical community, usually operating within standard setting organizations and dealing with technical issues, and the academic community, likewise involved in Internet Governance processes by producing knowledge, advancing discourses and analyses, and setting meanings and definitions. Similarly, civil society representatives, such as NGOs, social movements, journalists, and unions, are able to exert an influence on agenda setting and policy debate, both by mobilizing public opinion and by participating into discursive exchanges with other stakeholders during world summits and global fora. Also users' preferences and online behaviors influence at some, albeit limited, extent decisions about the Internet, while software agencies (which autonomously make micro-decisions about access, traffic routing, data processing, etc.) can have a deep impact on how the Internet works. Even if these agents are designed by human agency, they often develop their own logic by combining different decisions, information, and procedures and, in some cases, by learning from past experience. As a consequence of the heterogeneity and interdependence of actors, agents, and issues which constitute its object of research, IG as a field of studies is inherently transdisciplinary, and holistic approaches are often advanced in much of literature.

## Future Trends

The fast pace of technological innovation makes the Internet an ever-changing environment. Several new policy issues are emerging nowadays, and their relevance for the whole society is going to swiftly increase. The dissemination of interconnected objects (the Internet of Things, IoT) and the digitalization of urban spaces (Smart Cities), as well as the widespread of drones and robots, are both enabling a huge data collection matrix (Big Data) and bringing into physical reality several actuators controlled through the Internet. Artificial intelligence (AI), self-driving cars, wired biomedical devices, and cryptocurrencies are rising significant policy issues concerning political rights and civil liberties, as well as labor, welfare, health, security,

and legal responsibility. The configuration, management, coordination, and development of these technologies, which are all reliant on the Internet, are expected to further stimulate the "Internet Governance ecosystem" (Levinson and Marzouki 2016), by producing new collective challenges, opportunities, cooperation, and conflicts.

# Interorganizational Networks in the Context of Arts and Culture

Alisa V. Moldavanova[1] and Isil Akbulut-Gok[2]
[1]Political Science Department, Wayne State University, Detroit, MI, USA
[2]Department of Government, Sacred Heart University, Fairfield, CT, USA

## Synonyms

Organizational connectedness; Organizational linkages; Organizational ties

## Definition

Interorganizational networks refer to any set of links between organizations formed to exchange resources, information, expertise, and human capital.

## Introduction

Organizational networking behavior is considered a viable organizational response to external pressures (Foster and Meinhard 2002; Guo and Acar 2005; MacIndoe and Sullivan 2014; Sowa 2008), since interorganizational relationships strengthen organizational capacity and resource base (MacIndoe and Sullivan 2014; Sowa 2008), foster innovation (Kapucu et al. 2010), enhance organizational legitimacy (Chen and Graddy 2010), and increase overall organizational and system resilience (Kapucu et al. 2010). Although the benefits of interorganizational relationships are numerous, we lack knowledge of how networks among organizations operate in stressed environments, how they are structured, and which organizational and environmental factors influence network formation (O'Toole 2015).

Organizational stress is typically conceived as either internal or external pressures that organizations and/or their populations face (Hannan and Freeman 2009). Such pressures can lead to minor organizational consequences and, in some cases, be considered as an opportunity to learn and innovate, or they could have detrimental effects on organizational capacity questioning the very prospects for organizational survival. Networks and other forms of collaborative relationships commonly emerge in the context of external stress that affects various organizational types. One common form of external stress that affects public, private, and nonprofit organizations is economic recession, the latest of which – the Great Recession of 2007–2008 – provides a fruitful setting for exploring how organizations may cope with external stress by acquiring various scarce resources via interorganizational networks.

The collaborative process under conditions of stress is characterized by various tensions. For example, coping with stress is both individual and collective enterprise, and organizations existing within the same ecology both collaborate and compete for the same pool of resources (Hannan and Freeman 2009). Moreover, competition for resources may inhibit the intensity and scope of collaboration (Berardo and Scholz 2010), erode the already-existing networks (Hannan and Freeman 2009), as well as create tensions for organizational autonomy (Foster and Meinhard 2002). In the context of arts and culture organizations, the collaborative process is complicated by the sector's distinctiveness (Toepler and Wyszomirski 2012) and its reliance on individualistic modes of expression (Moldavanova 2016). As some studies indicate, aspiring to become more resilient via partnering with others may actually conflict with maintaining organizational distinctiveness; both, however, are critical for the sustainability of arts organizations (Moldavanova 2016). Moreover, the lack of public funding and dependence on private support (Toepler and Wyszomirski 2012) disproportionally affect cultural organizations during recessions. Therefore, this sector presents a valuable context for exploring collaborative dynamics in organizations under stress.

The purpose of this entry is to provide a concise overview of what is known of the role of interorganizational networks as a resource acquisition mechanism in organizations that cope with external stress. It begins with the discussion of the two key theoretical perspectives – the resource dependency and network theories – that address the formation of interorganizational networks. It places the discussion in the context of arts and culture organizations and networks formed by such organizations in the aftermath of the Great Recession and provides an overview of network-specific resource acquisition strategies used in the context of the three typical types of collaborative relationships formed by the cultural sector organizations – information exchange, resource share, and project-based partnerships. The entry then discusses how external stress as well as a variety of organizational attributes may shape the structure and composition of interorganizational networks by enabling organizations to cope with

resource instability and insufficiency via interorganizational relationships. The entry concludes by discussing possible future research directions.

### Theoretical Perspectives

Scholars of interorganizational networks commonly rely on three theoretical lenses to explain how collaboration develops and what outcomes are achieved: network, resource dependency, and institutional theories (Guo and Acar 2005; MacIndoe and Sullivan 2014; Sowa 2008). While the institutional theory is appropriate for many collaboration studies (Guo and Acar 2005; Sowa 2008), it is primarily used in cross-sector collaboration literature, especially literature involving social and human service organizations. When it comes to arts and culture organizations, the context in which they operate is quite distinct from other types of public service organizations. Although most cultural organizations are nonprofits, creative expression in the United States has been historically considered as an "independent" domain with very little regulatory involvement from the government and relatively small allocations of public funds (Toepler and Wyszomirski 2012). While professional organizations, such as the American Alliance of Museums or the League of American Orchestras, are responsible for instilling ethical standards in the field, these organizations do not exert the same kinds of strong institutional pressures that exist in other fields, where compliance and certification pressures are more common. Foundations are perhaps the largest source of institutional pressure on the arts and culture organizations; however, foundations act via creating incentives rather than enforcing compliance. Therefore, this entry focuses on resource dependency and network theories, rather than institutional theory.

## Resource Dependency Theory

Resource dependency theory recognizes that organizations are dependent on their external environment and that their ability to effectively derive various resources from their environment is of key importance for survival (Pfeffer and Salancik 1978). The resource dependency perspective explains how organizations cope with resource deficiencies by making strategic choices that ultimately allow organizations to manage their resource dependency and increase their autonomy (Pfeffer and Salancik 1978). This perspective implies that organizations are capable of learning and adapting to changes in their environments.

The resource dependency theory is helpful for understanding interorganizational behavior, as other organizations – potential collaborators – are, in fact, important elements of the organizational environment. Moreover, the resources that one organization needs to ensure its survival are often possessed by other organizations. Therefore, even formally independent organizations may depend on each other for various resources. This creates powerful incentives for creating alliances, mergers, as well as smaller-scale partnerships (Guo and Acar 2005; Sowa 2008). These types of strategies are likely to be effective at times of crisis, such as fiscal recessions, that affect multiple funding streams at once. Many organizations suffer from reduced funding at times of recession, but this particularly affects arts and culture nonprofits that receive marginal governmental support and therefore lack the public funding safety net (Toepler and Wyszomirski 2012).

Interorganizational relationships perform several key functions when it comes to reducing environmental dependencies and regaining organizational autonomy (Pfeffer and Salancik 1978). First, organizational networks provide increased access to various kinds of resources, including information, technology, and opportunities to partner with others in order to increase service efficiency (Guo and Acar 2005; MacIndoe and Sullivan 2014; Sowa 2008). Second, interorganizational relationships enhance organizational legitimacy (Chen and Graddy 2010). Third, interorganizational networks present a viable context for organizational learning by facilitating the diffusion of innovation and ideas (Kapucu et al. 2010). Recognizing these benefits, both governments and foundations may

incentivize organizational partnerships by making it a condition of their grants.

In the aftermath of the Great Recession, interorganizational networks took a form of organizational social capital (Moldavanova and Goerdel 2018) developed by arts and culture institutions in order to enhance their ability to cope with, primarily financial, stress by obtaining access to critical resources (Pfeffer and Salancik 1978). In response to the financial stress induced by the Great Recession, many cultural organizations engaged in various cutback management strategies, such as downsizing their staff and programs. Arguably, however, forming collaborative ties with other organizations could be seen as a more viable way of coping with recession-imposed stress (MacIndoe and Sullivan 2014; Moldavanova and Goerdel 2018). While potential organizational partners may also suffer from financial losses, there are various other forms of resources that could be gained by networking.

Cultural organizations engage in various kinds of networking relationships inside and outside of their field, including bonding-type ties with other arts and culture organizations, as well as bridging-type ties with businesses, universities, social service nonprofits, faith-based organizations, and so forth (Moldavanova and Goerdel 2018). In the context of the Great Recession, relying on bonding and bridging ties could be seen as a viable resource acquisition strategy that is likely to lead to obtaining information, infrastructure, and financial and human resources.

There are three types of network-based resource acquisition strategies that are common in the arts and culture field – information exchange, resource share, and partnerships. While relying on these three types of relationships does not necessarily lead to immediate financial gains, it helps to compensate for organizational losses and improves organizational capacity in the long run. For example, by expanding their communication networks, cultural organizations gain access to useful information about grants and other funding opportunities, as well as events that they could participate in order to diversity their stakeholders. It is also common to share administrative staff, exhibition and performing infrastructure, and other types of resources. Finally, engaging in project-based partnerships with others helps to enhance mission effectiveness.

While organizations derive resources via forming ties with others, particular resource dependency patterns may also shape the choice of partners. For example, MacIndoe and Sullivan (2014) found that resource dependence on private funding increases within-sector collaboration of nonprofits with other nonprofits, while reliance on governmental funding increases the likelihood of cross-sector collaboration. Considering the substantial reliance of cultural organizations on private funding (Toepler and Wyszomirski 2012), many of their relationships are formed with other nonprofits or businesses, and they develop fewer connections with governmental institutions. Although educational institutions do not always provide financial resources to the arts and culture organizations, they appeal to future generations of patrons and supporters, thus enhancing prospects for the intergenerational sustainability of the arts and culture sector (Moldavanova 2016). Therefore, arts and culture organizations frequently partner with educational institutions, especially K-12 organizations.

## Network Theories

In public service contexts, networks are researched as either a dependent variable (Guo and Acar 2005) or as an independent variable (Kapucu et al. 2010; O'Toole 2015). Within the first stream of literature, scholars examine internal network dynamics, how and when networks are formed, and how external environmental and internal organizational factors influence the formation of networks. Within the second stream, scholars focus on researching the outcomes of networks for policy implementation and organizational effectiveness. This entry treats networks as a dependent variable and a form of social capital that helps organizations to cope with stress by gaining access to resources (Pfeffer and Salancik 1978).

While the concept of social capital has been defined in many ways, scholars distinguish among three common approaches to social capital: (1) individual social capital as access to resources, (2) structural social capital as a source of social cohesion, and (3) structural social capital as brokerage across structural holes in networks. The first approach follows the legacy of Bourdieu (1986), who linked individual possession of social capital to social class. The second approach is associated with Putnam (2000), who defines social capital as strong bonds between social actors embedded in networks and trust that results in mutual support and solidarity. The third tradition is associated with works by Granovetter (1973) and Burt (1992), who described how network structure affects individual and network outcomes. When it comes to organizations, two perspectives to social capital appear to be particularly useful – structural and social selection.

The structural perspective draws on studies of social capital to assess an actor's network position. The literature on structural properties of networks compares the benefits of dense connections versus sparse networks, providing mixed support for both positions (Berardo and Scholz 2010; Ryu 2015). Some scholars suggest that loosely coupled networks, which are rich in structural holes, are more beneficial for resource and information acquisition as they provide opportunities for brokerage (Ryu 2015). Others, however, argue that dense networks, which are generally represented by bonding ties, enhance trust and reduce transaction costs (Berardo and Scholz 2010). Consequently, bonding ties are believed to increase the probability of forming new ties and sustaining existing ones (Berardo and Scholz 2010). Moreover, at times of stress and uncertainty having denser, bonding-type, networks may serve as an effective coping mechanism (Ryu 2015). Bonding social ties may also be preferred in competitive environments (Berardo and Scholz 2010), where bridging social capital is costly to form.

The social selection perspective examines ties among actors according to attribute-based actor similarity (Lazarsfeld and Merton 1954) and geography-based homophily (Atouba and Shumate 2015). McPherson et al. (2001), for example, found that individuals tend to forge ties with similar others. Similarly, organizations tend to cooperate with other organizations that share similar organizational characteristics as homophily enhances trust (Atouba and Shumate 2015), which facilitates the creation of common norms and stimulates stronger and more durable ties (Lazarsfeld and Merton 1954).

Homophily based on organizational type is another way to approximate bonding versus bridging social capital. While bonding capital is formed in homogeneous networks, bridging capital is formed in heterogeneous networks among actors with dissimilar attributes (Coffé and Geys 2007; Ryu 2015).

A special case of homophily is the propinquity thesis advanced by Krackhardt (2003), who argued that the possibility of interaction between actors increases with geographic proximity. Being proximate is likely to increase opportunities for encounters, which in turn can facilitate the formation of new ties as well as enhance the maintenance of existing ones. Furthermore, organizations located in close proximity to each other are likely to be exposed to similar environmental stress and share common concerns and also more likely to develop collecting mechanisms for coping with external stress.

### Organizational Stress and Network-Based Resource Acquisition Strategies

Both structural approach (Burt 1992; Granovetter 1973) and social selection perspective (Krackhardt 2003; Lazarsfeld and Merton 1954) are useful for understanding the structure and composition of interorganizational networks in the context of arts and culture organizations. Networks of individual organizations will be farther referred to as ego networks. Ego networks comprise a focal actor, i.e., the *ego*, along with the actors that are connected to the ego, *alters*. In ego networks, connections among alters and the characteristics of alters are generally acquired from the ego.

## Effects of Stress on Ego Network Structure

In resource-constrained environments, the benefits of organizational connectedness are many. For example, higher number of connections allows organizations to enhance their overall social capital and gain access to key resources and information needed for organizational survival (Carnovale and Yeniyurt 2014). Moreover, increasing the number of partners could reduce organizational resource dependence on any particular partner, which is especially important in the arts and culture field that tends to over-rely on private contributions. Therefore, by expanding their networks, arts and culture organizations may gain opportunities to connect with more diverse potential donors.

Considering these benefits of larger networks, organizations under higher levels of stress may be interested in forming new ties to enhance their opportunities to acquire much needed resources along with skills and expertise related to their core tasks. For instance, by engaging in networking, managers of arts and culture organizations can learn from others about new methods to increase the efficiency of service delivery and different means of reducing expenditures. Therefore, arts and culture organizations under higher levels of stress are likely to engage in greater number of relationships in order to diversify their resource base and reduce their environmental dependency.

To be sure, simply increasing network size may not fully help the stressed organizations to acquire the needed resources, since at least some of their new connections would be formed with other resource-constrained partners. Therefore, other elements of network structure, such as the degree of network embeddedness expressed via network density and position centrality, are important as well. For instance, while being embedded in a dense network may improve an organization's ability to access resources, these resources may be redundant. In that sense, the extent of disconnectedness among its alters would benefit an ego by generating valuable bridging social capital (Burt 1992).

Furthermore, in times of stress, networks rich in structural holes may be preferred as they would enhance the flow of nonoverlapping information and diverse resources (Burt 1992). For example, rather than relying on their existing connections, arts and culture organizations may reach out to organizations that are not well integrated in their existing networks or have not previously engaged with the arts, including new institutional donors as well as individual supporters.

The next important structural property of a network is how centrally each organization is located with respect to its partners. A more central positioning of an organization within its network results in greater power and access to resources and information (Carnovale and Yeniyurt 2014). Therefore, in order to recover from the recession-induced stress, arts and culture organizations are likely to initiate new multi-actor partnerships and serve as brokers by connecting previously unconnected organizations. It should be noted that the centrality of an organization's positioning in the network is a by-product of an overall network configuration. However, organizations can still influence their own centrality if they possess information about the connections among their alters.

## Effects of Stress on Ego Network Composition

Homophily is the principle that network interaction between similar actors occurs at a higher rate than among dissimilar actors (McPherson et al. 2001). The first type of homophily is based on belonging to the same organizational field, in this case, forming ties with other arts and culture organizations. On the one hand, when stress is high, cultural organizations may be more likely to form bonding ties with organizations from their own field in order to reduce the transaction costs associated with the acquisition of unfamiliar connections (Atouba and Shumate 2015). On the other hand, it may be more beneficial for more stressed cultural organizations to form bridging ties with those outside of their own field, as such ties would likely improve organizations' access to

nonredundant information and resources (Ryu 2015). Forming bridging-type ties may also help arts organizations to diversify their stress-coping strategies by learning from other fields (e.g., schools, businesses, etc.), as well as avoid direct competition with their peers that peaked in the aftermath of the Great Recession.

The second common type of homophily is based on the geographic propinquity thesis (Krackhardt 2003). Previous studies found that organizations headquartered or located in the same geographic region are more likely to form networks, as physical proximity facilitates information flows and reduces the logistical costs of resource exchange (Atouba and Shumate 2015). For example, arts and culture organizations located in close proximity to each other may be more likely to consider space sharing and refer audience members to each other. Research also suggests that organizations located in closer proximity have similar mental models that motivate them to form collaborative ties (Atouba and Shumate 2015). Therefore, more stressed cultural organizations could be inclined to rely on ties with organizations from more proximate geographic areas.

## Organizational Types and Ego Network Structure and Composition

While the level of external stress may affect the formation of interorganizational networks, the structure and composition of networks may also be influenced by organizational attributes. Literature on interorganizational networks particularly emphasizes the role of organizational size and age. For example, Guo and Acar (2005) note that smaller organizations are more willing to develop ties with others, preferably larger organizations. This is not uncommon in the cultural field, as partnering with larger cultural institutions helps smaller organizations gain visibility and access to cultural patrons. On the other hand, given that large organizations with more financial and human resources are better able to mitigate the costs of interorganizational relationships, they may be more capable of expanding their network size and diversify their connections, as well as occupying more central positions that connect unlinked network partners.

In terms of age, studies show that younger organizations, with many competing priorities, are reluctant to engage in networks with others (Foster and Meinhard 2002), while older organizations may see such partnerships as an opportunity to attract more funding and other resources (Crittenden and Crittenden 2000). In a similar vein, older organizations may also assume the broker role by linking less connected organizations and thus solidifying their central roles within networks (Crittenden and Crittenden 2000).

Finally, organizational location may influence the structure and composition of networks as well (Atouba and Shumate 2015). In particular, due to their more central geographic positioning, urban organizations may be better positioned to develop larger and more diverse networks as compared to suburban organizations. A central positioning and access to strategic resources may also enable urban organizations to assume more central network roles.

## Conclusion

This entry provided an overview of the interorganizational networks and their role in coping with external stress in the context of arts and culture organizations. It first introduced the main theoretical perspectives that guide scholarly understanding of network-based resource acquisition strategies, focusing specifically the three common types of networks formed by arts and culture organizations – information exchange, resource share, and partnerships. It then discussed the effects of stress that organizations experienced in the aftermath of the Great Recession on both structure and composition of interorganizational networks as well as other organizational factors that may influence such networks.

The entry contributes to the literature on interorganizational networks and advances knowledge of the factors associated with such networks, as well as potential costs and barriers

of interorganizational relationships. As such, the research overview presented in this entry could serve as a basis for future research on the role of interorganizational networks as a stress-coping mechanism in the context of arts and culture organizations as well as other contexts.

The entry focused on the effects of stress on network structure and composition; however, in reality network structure and composition are not only shaped by stress, but they also shape organizational responses to such stress, thus creating more resilient organizations. Therefore, future studies would benefit from researching how different network structures and configurations affect the ability of organizations to cope with stress. Additionally, a potent direction for future research would be to explore the effects of networks as independent variables on organizational performance and other outcomes. Other potential avenues for future research include conducting both large-scale investigations and comparative case studies of interorganizational networks in order to gain in-depth insights about the importance of internal organizational dynamics that may affect the formation of networks.

# Interpersonal Trust in Brunei Public and Private Sector Employees

Lawrence Mundia
Psychological Studies and Human Development Academic Group,
Sultan Hassanal Bolkiah Institute of Education,
Universiti of Brunei Darussalam,
Bandar Seri Begawan, Brunei Darussalam

## Synonyms

Confidential relationships; Dependability; Trustworthiness

## Definition

Mutually beneficial relationship between individuals, individuals and an organization, several organizations, and countries.

## Introduction

Trust is a complex and multidimensional concept that is either interpersonal, institutional, or organizational in nature (Krot and Lewicka 2012). Krot and Lewicka (2012) expanded on this and pointed out that there were different dimensions of trust (e.g., competence, benevolence, and integrity) and several types of trust (e.g., horizontal or lateral trust between co-workers and vertical trust between employees and managers). Based on Krot and Lewicka (2012), trust was thus an important component of professional relationships between co-workers as well as between managers and employees. In their study, Krot and Lewicka (2012) found that integrity was the most important dimension of trust in relationships between co-workers, while benevolence was the most important dimension of trust in relationships between employees and managers. Ample empirical evidence suggests that positive trust-building practices between managers and workers lead to high productivity and organizational commitment in both public and private organizations (see Hassan et al. 2012). Matzler and Renzl (2006) argued that interpersonal trust in peers and management strongly influenced employee job satisfaction. In turn, employee satisfaction was an important driver of productivity, quality, and customer satisfaction (Matzler and Renzl 2006). Other researchers (e.g., Semerciöz et al. 2011) also found that trust between co-workers was positively associated with strategic innovativeness and that trust in general had a strong influence on a variety of organizational phenomena such as employee and team performance, reducing counterproductive behaviors, and increasing organizational revenue or profit. Stack (1978) suggested that interpersonal trust (IT) was a form of confidence, reliance, and faith in a person. Wrightsman (1991) implied that IT was reflective of the reliability (dependability) and validity (credibility) a person assumed in or expected from interactions and relationships with others.

## Objectives of the Study

The purpose of the present study was to investigate and determine for the first time the prevalence of interpersonal trust (IT) in Brunei public and private sector employees. A study similar to the current research has not been done before in Brunei. It is hoped the results will help reduce the existing literature and knowledge gaps on this issue.

## Methods

### Design

A quantitative field survey was preferred and used. This strategy enabled two trained research assistants to go out to government Ministries, Departments, and companies and directly collect the required data.

### Participants

The public sector had 137,300 labor force throughout Brunei who constituted the sampling frame (Department of Economic Planning and Development 2015). The total number of workers in the private sector was not known at the time of conducting the present study. Using the simple random sampling technique, 822 participants were recruited from the public sector. However, only 38 persons were recruited from the private sector due to potential participants' general lack of interest to volunteer for the study. The two selections gave a composite sample of 860. Employees who met the following 5-point inclusion/exclusion criteria were recruited: (1) persons of all genders, ethnicities, religions, and age; (2) full Brunei citizens and permanent residents; (3) employed in the public or private sector; (4) willingly volunteered to participate in the study; and (5) participants whose protocols were not heavily contaminated with common method bias, CMB (see Podsakoff et al. 2003). A sample of 860 was considered sufficient and acceptable to compute stable statistics at $p = 0.05$ or $p = 0.01$ (see Krejcie and Morgan (1970). The personal characteristics of the participants are presented in Table 1.

### Instruments

Study used two instruments. Part A was a 16-item demographic questionnaire constructed by the researcher (see Table 1). Part B consisted of 10 items from the Interpersonal Trust Scale, ITS (Rotter 1967) that measured the level of interpersonal trust. The items were rated on 5-point semantic differential scales (e.g., To what extent do you trust your co-workers or supervisor, or boss? Circle one number for your response: Do not trust at all 1 2 3 4 5 Trust completely).

The 10 items generated one exploratory factor analysis (EFA) factor, named interpersonal trust (eigen value >1; average item loading ≥0.400). The scale had adequate construct validity (common variance accounted = 67.234%). Based on the current study's sample data, the instrument's alpha reliability was 0.911 (Scale mean = 31.700; SEmean = 0.237; SD = 6.956; Median = 32.000; average nonspurious item-total correlation = 0.703). Low scorers on the interpersonal trust scale did not trust (distrusted) other people.

### Procedures

The present study was funded by the Brunei Research Council (BRC) in the Government of Brunei Darussalam through the University of Brunei Darussalam (UBD), a state tertiary institution. Written permission and approval to conduct the study were obtained from the University of Brunei Darussalam Ethics on behalf of the Brunei Research Council.

### Data Analysis

All the independent variables, IVs (socio-demographics) were categorical. The dependent variable DV (interpersonal trust total scores) was dichotomized at the median to facilitate the use of logistic regression. Low scorers on the DV were coded one (1), while higher scorers were coded zero (0). The quantitative data were then analyzed using descriptive statistics and hierarchical binary logistic regression analysis. To make decisions on the importance of the findings, two-tailed tests of statistical significance at both $p = 0.05$ and $p = 0.01$ levels and tests of statistical power such as effect sizes and model fit chi-square indices for binary logist regression analyses were used. All the statistical analyses were performed on the Statistical Package for the Social Sciences, SPSS (Version 22).

## Results

Compared to workers with a high education (reference group), employees with low education were far less likely to have high interpersonal trust for other people (B = −0.499, $p$ <0.01; Adjusted Odds Ratio, AOR = 0.607; 95% Confidence Interval, CI = 0.451–0.818). However, employees who sought help from family members when faced with problems were 1.3 times more likely to have high interpersonal trust in others compared to those who

**$p < 0.01$ (two-tailed)

consult the Ustad, religious leader (B = 0.400, $p$ <0.05; AOR = 1.491, 95% CI = 1.036–2.147). An employee who was the chief wage earner in the family was very likely to have high interpersonal trust in her/his interactions or relationships with other people than those who were not the main bread earners (B = 0.432, $p$ <0.01; AOR = 1.5, 95% CI = 1.153–1.058) (Table 2).

## Discussion

In this study, low and middle education were negatively related to interpersonal trust. Such behavior would not be helpful in many situations where employees are required to work collaboratively as a team. Previous research found out that positive trust-building practices between managers and workers lead to high productivity and organizational commitment in both public and private organizations (Hassan et al. 2012). In addition, interpersonal trust had a positive effect on strategic innovativeness as well as team performance (e.g., Semerciöz et al. 2011). Furthermore, Matzler and Renzl (2006) argued that interpersonal trust in peers and management strongly influenced employee job satisfaction. In turn, employee satisfaction was an important driver of productivity, quality, and customer satisfaction (Matzler and Renzl 2006).

However, scores for employees who sought help from family members when faced with problems, those who obtained help from the Ustad (religious teacher/leader) when in distress, and persons who were chief bread earners in the family were all correlated positively with interpersonal trust. In the absence of interviews with probes, it was not clear from the present study which dimensions of trust discussed by Krot and Lewicka (2012) were missing or involved in Brunei employees. It is important to know this information for two reasons. First, Krot and Lewicka (2012) found that integrity was the most important component of trust in relationships between co-workers while benevolence was the most important aspect of trust in relationships between employees and managers. The current study did not measure both integrity and benevolence. Second, once the types of trust that work and do not work are known, appropriate interventions could then be mounted to promote workplace interpersonal trust.

Based on the findings of the present study, attention and priority should be directed and accorded to Brunei employees with low and middle education when providing interpersonal trust interventions (both counseling and psychotherapy as well individual or group treatments). A number of independent variables (IVs) that correlated low and negatively with IT should also be targeted and included in interventions.

## Conclusion

One of the social consequences of any bureaucracy is lack of interpersonal trust (IT) among human resources. The present study aimed at determining the prevalence of IT in 860 randomly selected Brunei public and private sector employees of both genders. IT contributes to improved employee-management relations and reduction of industrial disputes. The field survey strategy was utilized to reach the participants, directly administer the instruments, and collect the completed protocols. Public and private sector workers with low education were far less likely to have high interpersonal trust compared to peers with high education. However, participants who sought help from family members and religious people when distressed were more likely to have interpersonal trust in other people than those who did not. In addition, the chief wage earner in the family household was also more likely to have trust in other people. Since trusting each other at workplaces is important, attention and priority should be directed at credible interventions that increase employees' IT. The findings have practical, religious, and cultural implications that need to be investigated by mixed-methods research using interview probes.

The present study had two main limitations. First, the study relied heavily on findings from quantitative survey data. A qualitative component with interview probes was required to triangulate the outcomes. Second, the number of private sector participants was too small ($n = 38$). Future research should address both of these concerns.

## Synonyms

Administrative state; Bureaucracy with autocratic history; Judicial-administrative relationship

## Definitions

The interplay between judiciary and administration in Taiwan is deeply affected by its autocratic history, which makes the judicial-administrative relationship in Taiwan a different story from that in the States.

## Introduction

The administrative development process in the United States is very different from that of most countries in the world. The US administration was developed through a "chinking in" process, which means it was developed incrementally as the need for administrative service in the society was created. Most countries in the world, such as those in Europe and Asia, developed their administrative system as empires. Taiwan, for example, inherited its administrative system from ancient China, whose legislative and judiciary power were both controlled by the administrative system. The system was maintained when Taiwan initiated a democratic transition in the 1980s. This article describes and analyzes how the judiciary system in Taiwan retrieved its constitutional power and how the bureaucratic system has progressively given up its privilege and deferred to court rulings. The article tries to find the answers from the

path of democratization in Taiwan and discusses how the path differences between Taiwan and the United States may make Taiwan's court-administrative relationship a different case from that of the United States.

## Judicial-Administrative Relationship in Ancient China

The judicial-administrative relationship in Taiwan can be defined by the role of bureaucracy in the autocratic age. Three features of the bureaucratic system in ancient China had a profound influence on the modern bureaucratic system in Taiwan. First, bureaucracy in ancient China was controlled by a group of social elites who were in turn controlled by the emperor. A highly centralized bureaucratic system had been in place since 221 B.C., and it allowed the emperor to control the bureaucracy and ensure the absolute authority of the emperor. Upper-level bureaucrats and those who were close to the royal family had the greatest power over resources and personnel. The hierarchical structure also resembled existing social classes; bureaucrats, as they served the emperor, were also regarded as one of the ruling classes who were superior to civilians. Second, bureaucracy controlled the administration and the judiciary as well. In ancient China, a law suit was brought to a local government where the mayor was also a judge. When an appeal was necessary, the suit was brought from a city government, for example, to a state government where the governor would be the judge. The emperor was the judge of the final court of appeals. These rulers controlled both the administration and the judiciary, and therefore, the judicial system was viewed as a tool for rulers to rule.

Third, the judicial-administrative relationship was not built on the basis of legality, but on hierarchical relationships as the source of authority in ancient Chinese bureaucracy was tradition. Ancient Chinese bureaucrats were usually seen as parents for civilians in the public field, and their authority was traditionally, not legally, defined. According to Max Weber (2009), traditional authority is grounded in tradition, which rests on an "established belief in the sanctity of immemorial traditions and the legitimacy of the status of those exercising authority under them." The traditional bureaucratic authority controlled both the administration and the judiciary; therefore, the key to the judicial-administrative relationship was whether bureaucrats could respect the law and have faith in justice and fairness. If not, as bureaucrats could use legal judgments to satisfy their superiors, laws were only tools for administrators. Thus, the administration was superior to the judiciary in these circumstances.

Another piece of evidence that the judicial-administrative relationship was not based on legality was the fact that civilians usually had little trust in the legal institution; they usually believed that laws were used to protect those who had power. Civilians with no political or economic power were at a disadvantage when dealing with the government. This was why civilians in ancient China usually prayed for a saint to be their governor, someone who would treat civilians as family. This phenomenon revealed that laws were easily manipulated by the administration.

Considering these three features of ancient Chinese bureaucracy, it was distinct from Weberian bureaucracy in three dimensions. First, the bureaucracy was made up of a social class who ruled the country but was controlled by the emperor and the royal family. Second, the bureaucracy controlled both the administration and the judiciary. Third, the judicial-administrative relationship was not defined by laws, but determined by whether the bureaucracy could respect laws or use laws as a tool to satisfy administrative needs. These features can still be found in the modern bureaucratic system in Taiwan.

## Before the Initiation of the Democratic Taiwan

The features of ancient Chinese bureaucracy remained even as the Republic of China evolved into a democratic country. The features of centralization, elite control, tradition, and a blended

administrative and judiciary system could be observed in the three stages of progressive democratization proposed by the nation's founding father, Dr. Sun Yat-sen's three-stage state-building plan: stratocracy, political tutelage, and constitutional government. At the stratocracy stage, the country was ruled by the military, which controlled both the administration and the judiciary. At that stage, the goal was to unify the country and promote the democratic constitution. All of the power was centralized in the hands of a military government. The second stage was a transition period for the country to become a democratic regime. According to the founding father, the Chinese people needed to be trained and educated to be their own masters to establish a democratic country because they had been used to autocracy and being submissive. The training started with the establishment of local governments to guide people to elect mayors, and this was followed by organizing congress. Establishing a democratic constitution was the terminal goal. However, ironically, the training process was still centralized in the hands of political elites led by the ruling party, the Kuomintang (KMT).

1947 was the end of political tutelage, and the Republic of China was about to begin moving into the stage of constitutional government. However, the beginning of the civil war between the KMT and the Chinese Communist Party (the CCP) ended the Constitution, and the Republic of China led by the KMT retreated to Taiwan in 1949. After retreating to Taiwan, although theoretically the government would have entered into the third stage, constitutional government, the Constitution was suspended because of the Temporary Provisions Effective During the Period of National Mobilization for Suppression of the Communist Rebellion (Temporary Provisions), which replaced the Constitution in war time. Due to the Temporary Provisions, the autocracy remained. Martial law was declared and the KMT kept holding all the power. The administration, legislation, and judiciary were all in the hand of KMT elites. In other words, before the Temporary Provisions were lifted, the features of traditional Chinese bureaucracy still dominated Taiwan's government. The Temporary Provisions were abolished in 1991; simultaneously, the Constitution went into effect, and the stage of constitutional democracy began.

Throughout the three stages of democratization, the autocracy remained even when the new republic was established. The bureaucratic system within the government was still under the control of political elites, who were better educated and holding advantageous positions in both political and economic arena. These elites were in charge of the central and local governments, established laws and rules and implemented them, and also served as the chief judges. They controlled the country by promoting the public duties of democratic education, social stability, and economic development that were on their shoulders. Thus, their new ruling status was full of bureaucratic characteristics from the past. First, as these elites were the main bureaucrats, the bureaucracy was seen as belonging to the ruling classes, which were superior to regular civilians. Second, elites controlled both the administration and the judiciary, resembling the ancient system where the administration and judiciary were both in the hands of the bureaucrats who were loyal to the emperor. Thus, although a democratic Taiwan had theoretically been founded, the logic behind most governing activities resembles those from autocratic past.

## Taiwan's Administration under Democratization

The real democratization of Taiwan began in the 1980s. In 1987, martial law was lifted; in 1991, the National Assembly held its first reelection since its establishment in 1948; and in 1992, the Legislative Yuan was reelected. In 1996, Taiwan had its first direct presidential election, and in 2000, Taiwan had its first political party rotation, which ended the 55-year governance of the KMT. In 2016, the Legislative Yuan had its first political party rotation, and the Democratic Progressive Party (DPP) became the majority in the congress for the first time. Democratization changed the way people thought about legitimacy in

governance and further transformed the system of administration and the judiciary in Taiwan.

Democratization changed the source of authority and the meaning of professionalism in Taiwanese bureaucracy. In ancient China, bureaucrats were social elites who passed a national examination to serve the empire; in the early stage of the establishment of the Republic of China, social elites kept occupying the critical posts in the bureaucratic system and served the government, which was led by the KMT. In other words, before democratization in the 1980s, these professional elites were loyal to the government, but not to the people or the nation. The authority of the bureaucracy was not based on legal professions; instead, the authority was still traditionally tied to the autocratic power. This is why bureaucrats were considered part of the ruling class at that time. Democratization, however, established the new target that bureaucracy had to be responsive to the people and to the country, instead of to the leader. Superficially, what bureaucrats had to do was simply shift from following orders to following the rule of law; however, serving the leaders and the people was essentially distinct (Chen 2012). The major difference was that bureaucracy in the democratic age would have to deal with multiple stakeholders, and therefore neutral competency became a critical skill for bureaucrats.

Neutral competency is the ability of bureaucrats to say "no" to the politicians in order to sustain the public interest and to adhere to the core democratic values without deviation (Helco 1975). Thus, knowledge of democracy and professional ability are extremely important for establishing a democratic bureaucracy. Only when they have sufficient knowledge of and ability in their work can bureaucrats provide evidence for proposed policies.

The history of autocracy made it difficult for bureaucrats in Taiwan to practice neutral competency, and this decreased bureaucratic professions when democratization began. The professional ethos of the bureaucracy was affected because it was a tool for political leaders. The bureaucratic profession was conditionally developed when the KMT ruled the country as an autocrat. The KMT led the bureaucracy in finishing fundamental developments of the country and therefore developed a group of highly professional but submissive bureaucrats, perfectly inheriting this feature of the age of empire. To prevent the party's leadership being threatened, the KMT established multiple public organizations with similar functions to make sure that no single bureau could become strong enough to be free from control (Wang 2017). The strong leadership of the party successfully coordinated the divided but overlapping bureaucratic organizations and ensured the bureaucracy's submissiveness. The strong and centralized leadership resulted in two major consequences. First, the bureaucracy was used to being submissive to the political leadership, so the bureaucracy lacked autonomy when entering the democratic age. Second, bureaucratic professionals were limited due to the fragmented and functionally overlapped bureaucracy (Wang 2017). These organizations had difficulties to build up connections and to deal with complicated policies after ruling party rotations. These factors lowered the bureaucracy's neutral competence.

The lack of neutral competence made it easier for the bureaucracy to be influenced by politics in the democratic process when political parties competed for elections. The term "pork barrel politics" may best describe the democratic process in Taiwan, where political parties only proposed policies for winning elections, instead of for developing the country (Luor and Chang 2008). This situation was especially true after the first ruling party rotated out of office. At that point, due to its lower degree of neutral competency and its submissive nature, the bureaucracy already lacked sufficient professions to provide constructive suggestions and fight against improvident pork barrel policies. These policies, such as establishing more colleges, giving old farmers allowance, and extending the limits of credit card applications, were quite similar in nature that bureaucracy could learn by copy and paste (Wang 2017). In other words, this policy type further limited the growth of the bureaucratic profession, which created a negative feedback loop for bureaucracy that lowered its professionalism and strengthened the influence of political control.

## The Judiciary under Democratization

The power of judicial review was formally written into the Constitution of the Republic of China (ROC) in Nanjing in the late 1940s. Soon after, the civil war began between the KMT and the Communists. The ROC government passed Temporary Provisions Effective During the Period of National Mobilization for Suppression of the Communist Rebellion and suspended the Constitution. The power was centered on the presidency until the Temporary Provisions were removed in 1991. Before the provisions were lifted, the Grand Justice Council mainly served as the government's legal counsel, and its interpretation of laws placed no constraints on the government (Weng 2004). As "bureaucracy" and "government" were interchangeable terms at that time, the judiciary also served the administrative elites. The Grand Justice Council only had a legal counseling function because the function and the influence of the judiciary were missing in the Constitution and other related laws, such as the Organic Act of Judicial Yuan. The missing part of the Constitution led to the consequence that the power of the Grand Justice Council was undefined. The role of the judiciary was chaotic until the 1980s.

The Grand Justice Council, from the first to the third terms, was viewed as a governing tool for the ruling party, the KMT. The political party greatly influenced judiciary rulings. An old saying best described the role of the judiciary at that time: "the KMT owns the courts." As the democratization process continued, the judiciary system experienced a democratic revolution from within. Institutional changes occurred in the judiciary system. In 1989, the Judicial Personnel Act granted personnel security for judges to protect them from political influence (Tang and Huang 2008). From 1991, pre-review of judges' rulings was prohibited; judges' autonomy was put into effect completely in 1993 (Tang and Huang 2008). The Judicial Yuan established a judiciary revolution committee to implement judges' evaluation and self-regulation to minimize influence from administrative departments.

The revolution in the judiciary system aimed to completely eliminate political and administrative influence. Two ministers of the Judicial Yuan, Qi-Yang Shi and Yueh-Sheng Weng, between 1994 and 2007 played crucial roles in this revolution. These two ministers tried very hard to cut the connection between politics and the judiciary, though even the minister of Judicial Yuan was politically appointed (C.-S. Wang 2008). Another critical development was the establishment of a judicial personnel review committee, which was organized by judges only (Wang 2008). The committee guaranteed that every personnel decision regarding judges would be free from intervention by people in power. In other words, the judicial system was so professionalized that it was "judicialized" with pure judicial values (Wang 2008). The advantage of this revolution was that it successfully reduced the intervention of politicians and the administration and increased the professionalism of the judicial system.

These institutional revolutions resulted in significant changes in judiciary judgments. For example, Grand Justice Ruling No. 185 claimed in 1984 that the Judicial Yuan has the authority to interpret the Constitution and to unify the interpretation of laws and rules. Its ruling constrains nationwide public agencies and people. Ruling No. 185 is considered to be a milestone in that the Grand Justice Council established its influence over the country. In the meantime, the Council was also growing more independent. From the fifth and sixth term of the Council, the Grand Justice Council started to claim unconstitutional laws or rules invalid and issued expiration dates. The number of dissenting or concurring opinions was growing dramatically as well (Ginsburg 2002). From 1997 to 2001, the ratio of rules determined illegal by the administrative courts over cases under review grew from 0% to 20% (Yeh and Chan 2002). Thus, the judiciary progressed in growing its influence over administration.

The growth of judicial influence was built upon judicialization, which means that the judicial system blocked the voices from politics and the

administration. Judicialization won people's trust for the judicial system for its presentation of professionalism and neutralization. However, the radical judicialization was a double-bladed sword. The drawback was its lack of responsiveness to public needs, and that is the reason why the judicial system was later criticized as knowing nothing about the real world (Wang 2008). Judges were called "dragon judges," which describes judges whose decisions were so restricted by laws that they showed no humanity.

## The Current Judicial-Administrative Relationship

The development of the judicial-administrative relationship in Taiwan is a dynamic process, changing along with the developments in the judiciary and the administration in the process of democratization. The administration was transformed from a traditional bureaucracy which served the autocracy, while the judiciary was detached from the administration and tried to become independent. In the process, the power of the bureaucracy was taken and shared with multiple stakeholders. The process reduced the bureaucracy's neutral competency and weakened the power of the administration. In contrast, the judiciary was never an independent department; thus, at the beginning of democratization, its goal was to earn autonomy and to rule out political control. The process increased the judiciary's neutral competency and strengthened the power of judicial review over the administration.

As neutral competency has been compromised in the administration and has grown in the judiciary over the years of democratization, the judicial-administrative relationship is gradually approaching balance. The change can be observed in the percentage of cases declaimed as illegal by the courts. For example, no cases about administrative rules were brought to the Supreme Court before 1980. In the 1980s, 17% cases of rulings issued by the Supreme Court were about administrative rules; the rate rose to 70% in the 2010s.

Two important events happened in the year 2000, which made the year a critical moment for the judicial-administrative relationship. First, the first ruling party rotation happened in this year, and this was when political influence got involved in the administrative process. The bureaucracy in Taiwan started to experience real democracy as multiple stakeholders intervened in the policy implementation process and organizational management. This represented a significant change for bureaucrats, who were used to having only one boss. Second, in 2000, the Supreme Administrative Court experienced an organizational revolution, which initiated judicial activism in judicial review. Before the revolution, the Supreme Administrative Court tended to give administrative rules an easy pass when doing judicial review. Before 2000, no administrative rules were determined to be illegal in the Supreme Administrative Court. In the first half of 2000, administrative rules were claimed illegal in 2 out of 26 cases (8%). Starting from July 1, 2000, the Administrative Court became the Supreme Administrative Court; after the revolution, 21% of cases were claimed illegal (Yeh and Chan 2002). After 2000, the administration had lost its advantage when facing judicial review.

In fact, the increasing influence of judicial review over the administration was beneficial for both the judiciary and the administration. The administration needs the judiciary to bring back legitimacy for the administration. In the age of autocracy, the legitimacy of the bureaucratic administration was tied to its political leaders. The democratization process detached the administration from politics, and therefore the administration needed another source to legitimize itself. Theoretically, the legitimacy of the administration could be self-evidenced through neutral competency because the bureaucracy could apply its discretion to making creative decisions that refined processes and services. By doing so, the performance of public agencies could improve and gain more trust from the public and from political or judicial reviewers, which would give the agencies a higher public reputation and more

bureaucratic autonomy (Carpenter 2001). The administrative legitimacy was challenged when bureaucracy's neutral competency declined with political interventions in the democratization process. Therefore, when the judiciary earned trust from the public through depoliticization, allying with the judiciary became the best strategy for the administration to show its respect to democracy.

Compared with the long-existing bureaucracy, the judiciary was only a juvenile who was seeking to prove its importance and learning how to not overdo it. The complete depoliticization of the judiciary has drawn unrealistic and excessive criticism of the judges. Public agencies have complained that the Supreme Court's rulings are not realistic because the grand judges do not consider practical problems in the administration (Lin 2009). These unrealistic judgments have made it difficult for public agencies to follow the instructions from the Supreme Court. Delays in and disobedience to rule amendments have frequently occurred (Lin 2009). Therefore, even though the judiciary has implemented a stricter review of the administration and made more illegal rulings on administrative rules, it needs more experience through trial and error to make its judgments closer to administrative practice (Fig. 1).

## Comparison between Taiwan and the United States

The development of the judicial-administrative relationship in Taiwan revealed the features of an autocratic country that has transformed gradually into a democratic one. For a long time, the destiny of Chinese bureaucracy was to serve the emperor. This history naturally made the Taiwanese bureaucracy turn to serve the ruling party after democracy was established. After democratization, the involvement of political influence confused the well-trained bureaucracy and lowered its neutral competency, which gave the judiciary an opportunity to intervene. The development of the judiciary has followed a totally different path. The judicial power was attached to administration and controlled by bureaucrats in ancient China; even at the initial stage of the Republic of China, the judiciary still served the ruling party and the bureaucracy. After democratization, because of self-awareness inside the judicial system, political intervention was completely ruled out of the judicial personnel system, which improved the professionalism of the judicial system and increased its neutral competency. Judicial review started to have influence on the administration.

**Interplay Between Judicial Review and Bureaucratic Discretion, Taiwan, Fig. 1** The dynamic interplay between the judiciary and the administration in Taiwan

These features make the judicial-administrative relationship in Taiwan stand out when compared with that in the Unites States. First, Taiwan had a powerful administrative system at the initial stage, while the administration in the States was developed through a "chinking in" process (Stillman 1999). The discussion of powerful "administrative states" (Waldo 1948) was raised 200 years after the country was founded. In contrast, the power of judicial review was written into the Constitution of the United States when the country was founded; that part of regulation was missing in the Constitution of Taiwan. The different paths taken by administrative and judicial apparatuses in Taiwan and in the States imply that the dynamic of power shifts between the administration and the judiciary is different in these two countries. Later on, the Taiwanese judiciary personnel became free from electoral accountability; however, in the States, judges' nominations and states' attorney elections are political activities. The differences in the linkage of the judiciary to politics also imply that the function of judicial review over the administration should be considered differently in these two countries.

Another point worth mentioning is that Taiwan applies a civil law system, not a common law system as in the United States. In a civil law system, the foundations of judicial review are written regulations, not legal precedents. The foundation sets boundaries for judicial review, so it is limited by written laws and results in greater discretion for the administration. In contrast, judicial review in the United States has a greater scope and can thus have influence on budgets and management of public agencies.

## Conclusion

Due to these differences (see Table 1) between Taiwan and the United States, the "partner" relationship between the judiciary and administration in the United State (O'Leary and Wise 1991) may not be applicable in Taiwan. Even though public agencies sometimes require judicial review to correct mistakes and increase administrative legitimacy, they may not treat the judiciary as a "partner" but rather as a "tool" that can be used for the good of the administration. The "tool" thinking puts the administration and the judiciary in unequal positions, which makes the judicial-administrative relationship in Taiwan a different story from that of the United States. More studies should be undertaken to analyze how different historical factors and developmental paths have

**Interplay Between Judicial Review and Bureaucratic Discretion, Taiwan, Table 1** Judiciary and administration comparison between Taiwan and the United States

| | Taiwan (now) | United States | Taiwan (before democratization) |
|---|---|---|---|
| Roles of judiciary | Defined by grand justice ruling no. 185 | Defined in the constitution | Not defined |
| Paths approaching "administrative state" | Constitutionally defined and historically inherited | "Chinking in" | Historically inherited |
| System of administrative laws | Civil law system | Common law system | Civil law system |
| Sources of administrative authority | Legal authority increasing; traditional authority fading | Legal | Traditional |
| Judicial relationship with politics | Personnel is free from electoral accountability | Political activities involved in judicial personnel | Ruling tools for KMT |
| Judicial-administration relationship | Judiciary is a tool for administration to increase legitimacy | Partnership | Judiciary was a tool for administration to rule |

shaped the judicial-administrative relationship in both countries.

## Synonyms

Internal migration; Interprovincial migration

## Definition

*Interregional migration* consists of movements of people between geographic regions within a country.

## Introduction

Interregional migration has long been an important component of population change within Canada. Relative to other countries, Canadians appear to be quite mobile; according to Bell et al. (2015), Canada has the sixth highest 5-year internal migration intensity among the 61 countries examined and the ninth highest 1-year internal migration intensity among 45 countries. With respect to 5-year migration intensities, only New Zealand, South Korea, the United States, Australia, and Fiji rank higher than Canada. Moreover, although Canada is known as a country of immigrants, internal migration is a substantial contributor to changes in provincial populations.

## The Nature of Interregional Migration Flows

The magnitude of interregional migration flows depends on the definition of the geographic units being considered. In Canada, only interprovincial migration flows are monitored on an annual basis,

**Interregional Migration in Canada, Table 1** Geographic profile of Canada

| Province | Land area (sq. km) | Population 1911 | Population 2011 | Population density 2011 |
|---|---|---|---|---|
| Newfoundland and Labrador[a] | 370,510.8 | | 514,536 | 1.39 |

[b]The original Northwest Territories were split into a new, smaller Northwest Territories and the new territory of Nunavut in 1999

even though the provinces differ considerably in geographic area and population density. Table 1 lists the ten provinces and three territories, along with their populations in 1911 and 2011, their land areas, and their population densities. The provinces differ greatly in terms of both land area and population density, with tiny Prince Edward Island (PEI) having the highest population density of 24.66 persons per square kilometer and the largest province, Quebec, having a population density of only 5.83 persons per square kilometer (as of the most recent census in 2011). Because the territories account for such a small proportion of the population (0.32% in 2011), they are usually excluded from discussions of internal migration in Canada.

Data on migration are most readily available at the provincial level. However, some information about *intraprovincial* migration can be gleaned from census data. Since 1961 Canadian censuses have included a broad question about individuals' place of residence five years earlier, with an additional question about place of residence one year earlier being added in 1991. From the responses to these questions, one can gain some idea of the relative importance of interprovincial and intraprovincial flows, with an intraprovincial move being defined as a move between two census divisions within the same province (Statistics Canada 2010: 54). Figure 1 shows that for each of the ten provinces of Canada, the proportion of the population that lived in another sub-provincial area in the same province one year earlier is considerably higher than the proportion that lived in another province a year earlier. Only the three territories attract more migrants from elsewhere in Canada than from within. When the time horizon is extended to 5 years, as in Fig. 2, the rates of both types of migration increase in magnitude by two to four times, but intraprovincial migration flows remain larger than interprovincial flows in the ten provinces.

At the provincial level, historical census data indicate that even as early as 1911, when Canada was less than 50 years old and attracting large numbers of immigrants, migration from other provinces was also an important component of provincial population growth. If one defines an internal migrant to a province as someone who was born in another province, then Fig. 3 shows

**Interregional Migration in Canada, Fig. 1** Intraprovincial versus interprovincial 1-year migration rates, 2006. (Data source: Statistics Canada (n.d.-a)

**Interregional Migration in Canada, Fig. 2** Intraprovincial versus interprovincial 5-year migration rates, 2006. (Data source: Statistics Canada (n.d.-a)

**Interregional Migration in Canada, Fig. 3** Share of provincial population born in another province. (Data sources: 1911 – Statistics Canada (1983), Series A2-A14 and Series A327-338; 2006 – Statistics Canada (2012))

that internal migrants from the other provinces of Canada accounted for over 20% of the population of the four rapidly growing western provinces in 1911; by 2006, when Canada was a more mature country, migrants from other provinces were even more important to provincial populations than in 1911 in all provinces except Manitoba and Saskatchewan.

In addition to collecting information on internal migration through the census, which is conducted every 5 years, Statistics Canada also publishes annual estimates of migration flows between provinces dating back to 1971/1972. These estimates measure flows between July 1st of the initial year and June 30th of the subsequent year. As Fig. 4 indicates, they suggest that the proportion of the Canadian population that moves between provinces each year has decreased steadily, from 1.77% in 1971/1972 to an estimated 0.79% in 2014/2015. Nonetheless, this relatively low value of 0.79% is higher than the 1-year rates of interstate migration in the United States shown in Molloy et al. (2011), although whether rates of interprovincial and interstate migration are directly comparable given the very different areas and population densities of Canadian provinces and US states is not clear.

Despite the decline in the overall rate of interprovincial migration in Canada, net migration flows to individual provinces are quite volatile. Beginning with the easternmost provinces, Fig. 5 shows that net migration to the four relatively small Atlantic provinces has tended to be negative in most years, with Newfoundland and Labrador in particular losing large numbers of people to other provinces. Figure 6 reveals that the province of Quebec has fared even worse than Newfoundland and Labrador, experiencing negative net migration flows in every one of the 43 years pictured. Figure 7 indicates that the Prairie provinces of Manitoba and Saskatchewan have also experienced a net loss of population throughout most of the period, although more recently

**Interregional Migration in Canada, Fig. 4** Interprovincial migration as a percentage of the Canadian population 1971/1972 to 2014/2015. (Data source: Statistics Canada (n.d.-b, n.d.-d)

Saskatchewan enjoyed positive net inflows from mid-2006 to mid-2013.

The preponderance of negative net migration flows in Figs. 5, 6, and 7 raises the question of where all these migrants have ended up. This question is answered by Fig. 8, which presents net migration flows for the three remaining provinces, the central province of Ontario and the two westernmost provinces of Alberta and British Columbia (BC). Together these three provinces appear to have been the primary beneficiaries of the net outflows from the other provinces, although not always at the same time. Figure 8 shows, among other things, that when net inflows to Ontario are positive, they tend to be negative to Alberta and/or BC, and vice versa. Of the three provinces, Alberta is the one that has most often experienced population gains through net migration, with the most prominent exception occurring during the 1980s. This is no doubt why Alberta is the province with the highest share of Canadian-born residents who were born in another province, at 28.2% in 2006, as shown in Fig. 3.

## Economic Opportunities and Internal Migration

Another question that arises after examining Canadian migration data is what factors have induced the swings in net migration flows that are illustrated in Figs. 5, 6, 7, and 8. These factors can be subdivided into two principal categories: factors related to economic opportunities and policy-related factors. Differences in economic opportunities can be measured by differences between provinces in incomes and unemployment rates. As Fig. 9a, b illustrate, disparities in real household per capita disposable (i.e., after taxes and transfers) incomes have been a feature of the Canadian economy for decades. More importantly, the relative positions of the different provinces about the Canadian mean have remained fairly stable since 1926. Since Newfoundland and Labrador joined Confederation in 1949, Ontario, Alberta, and BC have been the only three provinces in which real disposable household income per capita spent much time above the

**Interregional Migration in Canada, Fig. 5** Net migration to Atlantic provinces, 1971/1972 to 2014/2015. (Data source: Statistics Canada (n.d.-c)

average. In all other provinces, real disposable household income per capita has remained below the Canadian average throughout most of the period since 1926. Although the figures also show that these disparities have narrowed over time, they do suggest the existence of an incentive to move from the poorer provinces to the richer ones. In 2013 the real disposable income gap between the poorest province, PEI, and the richest one (largely a result of natural resource exploitation), Alberta, amounted to $10,734 constant 2002 dollars per person. Numerous econometric analyses of interprovincial migration in Canada have found that holding other factors constant, income/wage differentials do encourage individuals to move from low-income to high-income provinces (e.g., Grant and Vanderkamp 1976).

It is also interesting to note that despite the fact that the relative positions of the provinces with respect to real per capita household disposable income have been surprisingly stable over the 87-year period depicted in Fig. 9a, b, some important changes have occurred that appear to be correlated with changes in net migration patterns. For example, Fig. 8 shows that net migration to Canada's most populous province, Ontario, turned negative in 2003–2004 and has remained negative ever since. Net migration to Alberta was quite high during that period, with the exception of the year 2009–2010. It is likely not a coincidence that as shown in Fig. 9a, during this same period the per capita income differential between the two provinces widened considerably. Similarly, increases in net migration to Newfoundland beginning in 1999/2000 (see Fig. 5) coincided with a 28% increase in real per capita disposable income in that province between 1998 and 2013, which is visible in Fig. 9a.

Although time-series data on provincial unemployment rate differentials are not available for as long a time period as data on income differentials, statistical measures such as the coefficient of variation suggest that they are even larger. (The

**Interregional Migration in Canada, Fig. 6** Net migration to Quebec, 1971/1972 to 2014/2015. (Data source: Statistics Canada (n.d.-c)

coefficient of variation is equal to the standard deviation divided by the mean.) Figure 10a, b present provincial unemployment rates relative to the Canadian national unemployment rate during the period 1976–2015. The narrowing of provincial disparities that is apparent in Fig. 9a, b is not evident in Fig. 10a, b. However, disparities between provinces clearly do exist, and as in the case of real income differentials, the relative positions of the provinces change very little over time. For the most part, the pattern observed here is the reverse of that in Fig. 9a, b, in that Alberta and Ontario have had below-average unemployment rates throughout most of the period, signifying better employment opportunities, while the four Atlantic provinces and Quebec, the provinces that have experienced the greatest loss of population through net migration, have consistently had above-average unemployment rates. Holding all else constant, economic models of migration behavior predict that individuals will tend to move from high-unemployment to low-unemployment regions, and to a large extent net migration patterns in Canada are consistent with such behavior. Econometric studies of interprovincial migration have been somewhat less conclusive on this point, however, perhaps because low-unemployment provinces also tend to be high-wage provinces, causing the effects of these two economic drivers of migration flows to become confounded. In addition, as discussed below, certain government policies in place in Canada are directly linked to unemployment rates and may mute the effect of unemployment differentials.

No discussion of the effects of economic factors such as wages and unemployment rates on migration would be complete without a brief discussion of some of the factors underlying provincial differences in these economic variables. In the Canadian case, the allocation of natural resources across the country plays an important role, particularly in the case of oil and natural gas. Canada's

**Interregional Migration in Canada, Fig. 7** Net migration to Manitoba and Saskatchewan 1971/1972 to 2014/2015. (Data source: Statistics Canada (n.d.-c)

oil and gas reserves are found primarily in the province of Alberta, with more limited amounts of both oil and natural gas being produced in Saskatchewan and British Columbia. On the east coast, the development of offshore oil since the early 1990s has had an important positive impact on Newfoundland's economy in particular. Much of the reduction in Newfoundland's unemployment rate and increase in its real disposable household income per capita since 2006 can be attributed to the expansion of its oil industry. Similarly, the oil industry is responsible for much of the gap in per capita incomes and unemployment rates between Alberta and the other provinces since the early 1980s, and it is this industry in particular that has drawn many migrants to Alberta. The heavy reliance of these provinces on one particular industry, however, has left them vulnerable to fluctuations in the price of oil such as the sudden collapse of oil prices in late 2014. The economies of Alberta and Newfoundland have been particularly hard-hit by this collapse, leading to increases in unemployment rates in both provinces that are evident in Fig. 10a. The full effect of the decline in oil prices has yet to be observed in the net migration data in Figs. 5 and 8.

Another economic factor that influences interregional migration in Canada is the cost of moving. Although it is difficult to measure – a complete measure of moving costs would include both monetary and nonmonetary costs of moving – it is generally agreed that moving costs are positively related to the distance between origin and destination. A negative correlation between migration flows from one province to another and the distance between them, holding other possible determinants of migration constant, is one of the strongest and most consistent results found in econometric studies of interprovincial migration in Canada. Yet another non-policy factor that cannot be ignored in migration studies in Canada is

**Interregional Migration in Canada, Fig. 8** Net migration to Ontario, Alberta, and British Columbia 1971/1972 to 2014/2015. (Data source: Statistics Canada (n.d.-c)

language; Canada is an officially bilingual country with an uneven distribution of French and English speakers across the provinces. The predominance of the French language in Quebec and the English language elsewhere means that an inability to speak one of the two official languages serves as a potential barrier to migration into and out of Quebec.

Finally, one should consider the reasons for the downward trend in interprovincial migration rates illustrated in Fig. 4, from over 1.5% in 1971/1972 to less than 1% in 2013/2014. One hypothesis is that this downward trend is due to the aging of the Canadian population that has occurred steadily over this period. It is clear from migration studies on Canada and elsewhere that (ceteris paribus) older people do not move as often as younger adults. A second, not mutually exclusive, possibility is that the downward trend is due to the convergence of provincial per capita incomes that has occurred over the period illustrated in Fig. 9. These hypotheses have not yet been tested against each other.

## Interprovincial Migration and Public Policy

Tiebout (1956) was one of the first economists to draw attention to the possibility that public policies could influence migration decisions, arguing that individuals would "vote with their feet" by choosing the community that offered the tax and benefit package that they most preferred. Since then, the effect of public policy on interprovincial migration flows has been a subject of much debate among economists in Canada. Because provincial governments have considerable autonomy with respect to fiscal policy, there exist differences between provinces in terms of public services and taxation that could in principle influence migration flows. Provincial differences in sales

**Interregional Migration in Canada, Fig. 9** (**a**, **b**) Real household disposable income per capita relative to Canadian value, 1926–2013. (Data source: Statistics Canada (n.d.-f)

taxes and personal income taxes have been particularly marked. In particular, the government of Alberta has not collected a general sales tax since 1937. At the other extreme, the Harmonized Sales Tax (HST) rate in Nova Scotia in mid-2016 was 15%, of which 5% constituted the Canada-wide federal rate and the remaining 10% constituted the provincial rate (CRA 2016). Alberta has also for many years imposed the lowest provincial personal income tax rate in the country. In 2014,

**Interregional Migration in Canada, Fig. 10** (**a**, **b**) Provincial unemployment rates relative to Canadian rate 1976–2015. (Data source: Statistics Canada (n.d.-e)

for example, it imposed a flat rate of 10% on incomes earned within the province (Alberta 2016). In comparison, in Quebec provincial marginal personal income tax rates ranged from 16% on taxable incomes up to $41,495 to 25.75% on incomes above $100,970 (Revenu Quebec 2015). However, these differences are beginning to narrow, as the worldwide collapse in oil prices and resulting contraction of Alberta's oil industry has led to a loss of government revenue that prompted that province to introduce a progressive income tax in 2015, with the highest marginal tax rate rising to 15% in 2016 (Alberta 2016).

While there is no doubt that tax differences that affect households exist in Canada, it is harder to estimate their impact on interprovincial migration flows. Holding all else constant, one would expect that higher income or sales taxes in a province would provide individuals with a disincentive to move to that province. Some empirical studies of the determinants of migration use after-tax incomes or wages as their income measure – see, for example, Day and Winer (2012) – which implies that any income tax change that reduces after-tax incomes will reduce inflows of migrants into a province.

On the expenditure side, provincial governments may also attract migrants by offering better public services. Education and health care are two types of public services that may be of particular interest to migrants. Although in the health-care domain provinces are constrained somewhat by the Canada Health Act, there are no such constraints on the provision of public education (although the provinces do receive education-related transfer payments from the federal government). Despite the lack of national standards for education, educational systems are fairly similar in structure across Canada, with the primary exception being the province of Quebec, where students graduate from high school in Grade 11 and then usually spend one or two years at a CEGEP, or "Collège d'enseignement général et professionnel." (University-bound students in Quebec must attend 2 years of CEGEP after graduating from high school.) Education in public schools up till the completion of Grade 11 in Quebec and Grade 12 in the other provinces is free; tuition fees at CEGEPs are also nominal for Quebec residents. However, curricula and the quality of education may vary across provinces. Efforts to evaluate empirically the effects of provincial differences in the provision of public services on migration flows have been hampered by the fact that the only available data pertain to differences in per capita spending, not the quality of the services provided, although there exists some evidence that migrants are more likely to move to provinces that spend more per capita on public services, especially education and health care, holding all else equal.

Although the natural place to start when looking for policies that might influence interregional migration flows is at the regional government level, Canadian economists have long been concerned about the potential effects on interprovincial migration of two *federal* government policies: unemployment insurance and equalization payments (e.g., Courchene 1970). If unemployment insurance payments in Canada were based solely on the individual's level of income prior to becoming unemployed and the length of time the individual had been employed, there would be little reason to expect unemployment insurance to influence interregional migration decisions. However, since 1971 the Canadian unemployment insurance system has included what is known as a *regional extended benefit*, a provision that links the number of weeks of benefits to which an individual is entitled to the current local unemployment rate. Although all provinces have typically included some high-unemployment regions where individuals are entitled to more generous benefits, there tend to be more such regions in high-unemployment provinces. Thus, it has been argued that the regional extended benefit provides a disincentive to leave high-unemployment regions/provinces in order to seek jobs elsewhere.

In 1977 the correlation between unemployment insurance (UI) benefits and regional unemployment rates was further strengthened by the introduction of the *variable entrance requirement*, which linked the number of weeks of work required to qualify for benefits to the local unemployment rate. In regions with high

unemployment rates, fewer weeks of work were required to qualify for benefits. This provision too may provide a disincentive to migrate from high-unemployment regions, since it is harder to qualify for unemployment benefits in low-unemployment regions.

Although the Canadian unemployment insurance system has undergone many changes since 1977, including a change in name to "Employment Insurance" (EI) in 1996 and a reformulation of qualifying conditions in terms of hours of work rather than weeks of work, both the regional extended benefit and the variable entrance requirement (VER) remain prominent features of the Canadian EI system. As of July 2016, the number of weeks of regular benefits to which an individual with 700–734 h of work would be entitled ranged from 14 for individuals who lived in EI regions with unemployment rates below 6% to 36 weeks for individuals who lived in EI regions with unemployment rates above 16%. Moreover, under the VER an individual living in a region with an unemployment rate above 16% actually needs only 420 h of work to qualify for benefits and would be entitled to 32 weeks of regular benefits in that case; an individual living in a region with an unemployment rate below 6% would need to work at least 700 h to be entitled to any regular benefits at all and would receive no more than 14 weeks of benefits unless he/she had worked for more than 734 h (Canada 2016). While each individual's situation is different, the substantial size of these interregional differences in benefits explains why they have been the subject of some concern with respect to their potential impact on migration flows. Unfortunately, the strong correlation between UI/EI benefits and unemployment rates has made it extremely difficult to distinguish empirically their separate impacts on interprovincial migration in Canada. The question of their effect on interprovincial migration flows has not been conclusively resolved, but there is some evidence that if regional differences in UI do affect migration flows, the effect is smaller than that of interprovincial differences in wages and unemployment rates and is not large enough to substantially alter the state of regional labor markets (Day and Winer 2012).

The situation with respect to equalization payments in Canada is a little different from that of EI, since EI involves payments from the federal government to individuals but equalization payments are transfers between levels of government. Under Canada's equalization system, which was first introduced in 1957 and enshrined in the Constitution in 1982, "[p]arliament and the Government of Canada are committed to the principle of making equalization payments to ensure that provincial governments have sufficient revenues to provide reasonably comparable levels of public services and reasonably comparable levels of taxation" (Constitution Act, 1982, s 36). While the identities of "have" and "have-not" provinces have fluctuated somewhat over the years, the provinces receiving payments have tended to be those with relatively high unemployment rates and relatively low average incomes, leading to the concern that by providing poorer provincial governments with the means to provide more generous services per dollar of taxation than would otherwise have been the case, equalization payments have discouraged individuals from leaving high-unemployment, low-wage provinces.

Countering this pessimistic view of the effect of equalization payments on interprovincial migration flows is the argument put forward by Graham (1964) and Boadway and Flatters (1982). They argue that richer provinces might be attracting too many, not too few, migrants from the point of view of the economic efficiency of the country as a whole, precisely because their relative wealth allows them to provide more generous services at lower levels of taxation on individuals, thus divorcing earned incomes or marginal productivities from net incomes (after taxes and transfers). Boadway and Flatters' argument was motivated by the case of the oil-rich province of Alberta, which had access to revenues from oil and gas royalties not available to most other provinces, and thus was able to provide quite generous levels of public services while keeping taxes on individuals low (as has already been discussed).

Again, it is difficult to test empirically which of these competing arguments with respect to equalization payments predominates, because higher provincial government wealth, which tends to

reduce equalization grants, is correlated with better job opportunities. Also, it is not equalization grants paid by the federal government to the recipient provinces that matter in the end, but rather what the recipient governments do with the money. The existing, albeit limited, empirical evidence that per capita government spending on services such as health care and education, which are supported by equalization payments, is positively correlated with migration does provide an avenue through which these grants could influence migration flows. However, it is difficult to reliably quantify their impact.

Lastly, several large, discreet, and extraordinary policy shocks to the Canadian economy in the latter half of the twentieth century have demonstrated that while it is difficult to measure the effect of incremental changes in policy like adjustments to EI or changes in provincial tax rates, very large policy events do have a measurable effect on migration flows. One of these policy shocks was the sudden closure of the cod fishery off the coast of Newfoundland in July of 1992, which has been estimated to have put 30,000 people out of work (Higgins 2009). One empirical study finds that this sudden shock to the economy of Newfoundland and Labrador reduced net in-migration to the province by at least 18,000 people over the 1992–1996 period, after controlling for other factors that influence migration flows (Day and Winer 2012). The sudden drop in net migration to Newfoundland after the fishery shutdown is apparent in Fig. 5; net migration did not begin to increase again until 1998/1999.

The other two large policy events that have affected interprovincial migration flows in Canada involved the province of Quebec. First, in November 1969 the provincial government attempted to restrict access to English-language education through Bill 63, which raised considerable anxiety among the province's Anglophone population and immigrants to the province. Not quite a year later, the province was rocked by the kidnapping and execution of a provincial cabinet minister and the kidnapping of the British Trade Commissioner by members of the separatist Front de Libération du Québec (FLQ). Together these events led to a large increase in out-migration flows from Quebec. Second, the election of a separatist government in the province in 1976, followed by the passing of the restrictive language law Bill 101, stimulated yet more out-migration from the province. In fact, as Fig. 6 indicates, net migration to Quebec fell to its lowest levels ever in 1977/1978. Day and Winer (2012) estimate that these political events caused Quebec to experience a net loss of about 25,000 people during the 1969–1971 period and a further net loss of at least 26,000 people between 1976 and 1980, after controlling for other factors.

## Conclusions

Although annual interprovincial flows may appear to be small in magnitude, interregional migration plays an important role in determining the regional allocation of labor in the Canadian economy. This migration, in principle, contributes to the functioning of the Canadian labor market. By inducing workers to locate where their marginal productivity is relatively high, migration tends to lead to higher average earned incomes while at the same time equalizing incomes across the country as a whole.

It is clear from the empirical evidence that market wages and employment prospects are the main drivers of interregional migration in Canada, suggesting that the internal labor market functions reasonably well. However, the quantitative contribution of this migration to the level and distribution of earned incomes in the country is not actually known, nor is this a well-studied issue. It is not clear how important interregional migration is as a driver of economic prosperity as compared to, say, international immigration or technical change, although one study concluded that interprovincial migration was responsible for about 6% of the growth in labor productivity in Canada in 2006 (Sharpe et al. 2007).

Existing empirical evidence also indicates that extraordinary changes in public policy (such as the 1992 closing of the east coast cod fishery) have substantially altered interregional migration patterns, with other more regularized policies that can be measured, such as regionally differentiated

Employment Insurance benefits, probably having a more limited impact. One should note that there also exist many government regulations and laws that attempt to insulate regional labor markets from the competition that would occur if migration within the country was easier. These policies are harder to measure, and likely for this reason their effects on migration remain to be investigated. In view of the importance of federal grants to provincial public finances, it would also be desirable to quantify the extent to which the equalization system in Canada alters interregional migration patterns.

Both with respect to the role of the market and with respect to the role of public policy, substantial issues and problems concerning the determinants and consequences of interregional migration in Canada have yet to be fully explored.

# Involuntary "Members"

Brittany L. Peterson[1] and Kristen E. Okamoto[2]
[1]Ohio University, Athens, OH, USA
[2]Clemson University, Clemson, SC, USA

## Synonyms

Beneficiaries; Members without agency; Unplanned members; Unsolicited members

## Definition

Involuntary "members" are those individuals whose relationships with an organization, group, or community are without choice; rather they are mandatory, compulsory, and enforced against their will. Nonprofit and volunteer organizations often serve beneficiaries who are currently in or attempting to separate from these types of organizational relationships.

## Introduction

Historically, nonprofit organizations (NPOs) have been perceived as altruistic entities that exist for the betterment of society. They are typically understood to be voluntary organizations created to meet a public need where beneficiaries go to willingly receive services. And while this is true in part, this prevailing assumption has been challenged in recent years with the corporatization of the nonprofit industry. This shifting landscape of nonprofits has expanded our understanding of what it means to engage in nonprofit work. In particular, this shift has introduced acknowledgement of a type of nonprofit stakeholder known as an involuntary "member" or an involuntary "beneficiary."

The term "member" is often used to represent organizational relationships where people officially join and become members (e.g., gym memberships). This entry, however, does not specifically discuss membership in the context of nonprofit membership organizations such as associations or social clubs. Rather the term is used to analyze individual-organizational relationships more broadly with the focus on individuals who are considered to be the beneficiaries or receivers of services from the organization. It is in this vein that scholarship defines *involuntary* members as those individuals whose relationship with the organization is without choice or imposed upon them against their will (Peterson and McNamee 2016).

The entry begins by describing the concept of involuntary membership, which is rooted in scholarly conversations about stigma and total institutions in traditional for-profit or governmental organizations. Next, is a discussion of nonprofit and volunteer organizations that serve beneficiaries who are or have been involuntary "members" of other institutions. Examples of nonprofit clientele in this situation are those who struggle with at least one of three different challenges – health, displacement, and transition. The entry concludes with a discussion of the challenges and benefits of participating in this kind of work.

## Historical Roots

In the early 1960s, scholars began conversations about total institutions, such as prisons and asylums, which are organizations whose members or recipients of service are largely cut off from the

rest of society for extended periods of time (Foucault 1975; Goffman 1961, 1963). These institutions often house stigmatized individuals, or outcasts, who do not adhere to societal norms and expectations. The organizations were often physically set up to encourage the feeling of constant supervision, and consequently, compliance, a phenomenon known as panoptic control. In the example of a prison, a panoptic arrangement is one in which the watcher, a correctional officer in this case, can see all of the inmates but the inmates cannot see the watcher. This type of spatial arrangement gives the watcher a lot of control over the prison's inmates in so much as the inmates begin to act as if they are constantly being watched – even when they are not. This body of scholarship began to draw attention to the main service recipients in these kinds of institutions who have little, if any, control over their own daily lives. The kind of individuals housed in these institutions was later termed "involuntary members."

## Scholarship on Involuntary "Membership"

Typically, membership is thought of in categorical ways. For instance, the members of organizations could include. However, there are other ways to understand organizational membership. More specially, membership can be understood along a continuum from voluntary to involuntary, where involuntary membership indicates situations where individuals – including staff, employees, or beneficiaries – have very little control over their situations (Peterson and McNamee 2016). Scholarly work in this area suggests that people create their organizational experiences through their communication with superiors, subordinates, colleagues, covolunteers, and others. Through these interactions, they negotiate how much or how little control they have over the five different areas or facets of organizational experience, including their physical environment, mobility, relationships, body, and engagement. The greater control they have over each of the areas, the closer they will skew to the voluntary side of the "membership" continuum. The lesser control they have over these areas, the closer they will be to the involuntary side of the continuum.

The nature of membership – or one's relationship to an organization be that as a member or as a beneficiary – can be understood through one or more of the following five aspects of organizational experience: physical environment, mobility, relationships, body, and engagement. The physical environment relates to anything tangible that surrounds an individual in an organization, such as noises they hear, sights they see, possessions they have, or spaces they live in. For example, in the most extreme involuntary situations, individuals do not have control over the lighting in their rooms, the layout of the furniture, or the belongings in their space. The level of mobility speaks to an individual's freedom and capacity to move within, through, or around an organization. For instance, people in involuntary situations are often constrained in their ability to exit the organization that they are a part of without prior approval or permission. Another aspect is the extent to which individuals have autonomy over their relationships in an organization. For example, within involuntary organizations, living mates are often assigned and contact with outsiders, including family or friends, can be limited and/or monitored. Additionally, the aspect of body speaks to the corporeal experience of individuals and the degree to which they maintain control over their bodies. In some involuntary situations, individuals find that their body is frequently controlled, restrained, or abused by others. Finally, the organizational experience can be characterized according to engagement, which involves assessing the degree of voluntary participation in organizational activities or processes or the receipt of services from the organization. In the most involuntary of organizations, individuals might be forced to accept services or mandated to participate in activities by the organization.

## Types of Involuntary Nonprofit Beneficiaries

Overall, the continuum view of membership helps scholars and practitioners to characterize the different experiences that individuals might have with their respective organizations. Of particular interest to the present entry are beneficiaries

whose relationships with their respective nonprofit organizations are somewhat involuntary in nature. These individuals are often in circumstances that are outside of their control, they have little power, and they are dependent on NPOs to help them survive or to provide support, housing, or other basic needs. Accordingly, this section discusses three different types of involuntary beneficiaries who depend on NPO support: (1) individuals struggling with health conditions, such as developmental disabilities; (2) displaced individuals, such as individuals experiencing homelessness, and (3) individuals in transition, such as parolees. In each section, a type of involuntary beneficiary is identified and subsequently linked to one or more of the five aspects of membership to illustrate the ways in which they experience being involuntary members. Taken together, examination of these types of involuntary beneficiaries and their respective NPOs reveal unique commonalities when contrasted with traditional perspectives of nonprofit stakeholders.

## Involuntary Beneficiary: Individuals Struggling with Health Conditions

Within the context of the United States, many NPOs meet the needs of individuals struggling with various health conditions, including substance abuse and chronic disease. To begin, individuals living with substance abuse issues may receive services from various health providers. These individuals may be placed on the continuum of involuntary membership as they are generally subject to restricted mobility. That is, they are unable to physically exit or leave treatment facilities at will without prior permission from a medical professional. For instance, they may be placed into court-ordered counseling or treatment programs and may lose privileges that affect their mobility, such as losing a driver's license until they fulfill the conditions of the court order. In general, NPOs addressing substance abuse issues may be divided into self-help organizations, such as Alcoholics Anonymous, where individuals seek support for their own addiction, and support services, such as Al-Anon, an NPO that supports people who have a family member struggling with alcohol addiction. These organizations either organize to help those who are directly dealing with addiction issues, or family members who are living with individuals living with these issues. In sum, NPOs organized to address health issues tend to privilege the promotion of services, while still operating within current organizational and governmental structures and regulations.

Another particularly salient group of beneficiaries who receive services provided by NPOs are those living with chronic disease including Crohn's disease, fibromyalgia, and diabetes. These individuals are considered involuntary beneficiaries for a number of reasons. First, they are brought into and must maintain particular relationships with their doctors based on their unique health condition. Next, their physical surroundings are fixed, and often outside of their control as they are often surrounded by equipment like dialysis machines. Finally, individuals living with chronic health conditions often have little control over their bodies, as would be the case for a Crohn's patient living with a colostomy bag. One condition, in particular, has been given considerable attention: individuals living with HIV/AIDS. Between the 1980s and 1990s, nonprofit organizations in the United States received substantial governmental resources to address the growing epidemic. NPOs provide important medical service to individuals living with HIV/AIDS, including prophylactic measures such as screenings and pharmaceutical distribution. NPOs organized to address these issues may provide support to individuals, like the Center for Chronic Illness in Seattle, WA, or they may organize to raise funds for research, like the Global Alliance for Chronic Diseases in London.

## Involuntary Beneficiary: Individuals Struggling with Displacement

Organizations that aid in displacement issues also frequently serve involuntary beneficiaries particularly individuals experiencing homelessness, immigrant populations, and children within the foster care system. Collectively, these

individuals experience displacement, whether temporary or permanent. Each is discussed in turn below.

Individuals experiencing homelessness may be considered to be involuntary beneficiaries as many do not have much control over their physical environments or relationships. That is, many individuals experiencing homelessness live in homeless shelters and they live alongside coresidents selected by the shelter. There is a tacit assumption that persons without homes are homeless because of something that they have done or a life choice they have made – the so-called culture of poverty ideology. Although a select number of individuals experiencing homelessness might *choose* their living arrangements, most can be understood as involuntary in that they lack control over their "membership" in the emergent community for people without homes. Further, homelessness represents a complex constellation of issues, including physical and mental health, substance abuse, and familial diversity. Individuals experiencing homelessness depend on NPOs to provide essential services such as food, shelter, and clothing. Beyond these essential services, NPOs are an important resource for social capital as well. That is, NPOs aid in connecting the people experiencing homelessness with the larger surrounding community, fostering opportunities for employment, and tangible access to other resources.

Similar to NPOs organized to aid people struggling with homelessness, organizations designed to aid immigrant populations must also work to secure essential resources for individuals. Immigrants may be considered involuntary beneficiaries because of their lack of control over their physical environment. For example, immigrants are tethered or certain cities because they are known for being safe and welcoming to immigrants. Notably, it is imperative that NPOs serving the immigrant population remain responsive to its surrounding environment and sensitive to local needs. Further, survival of these organizations depends upon the length of time they have been established. Organizations that are less established are likely to be perceived by the community as less legitimate, and thus have a harder time receiving support.

It is imperative that organizations aiding displaced individuals respect and attend to the local communities in which they are embedded. These NP organizations are subject to both local and national level laws and regulations that mandate how, where, and when they operate. For instance, in the United States, homeless shelters are often expected to collect private information about their beneficiaries, like their social security numbers, before they can receive state funding. These kinds of mandates further exacerbate the involuntary nature of beneficiaries as they have little choice but to provide very private information in exchange for having a place to sleep at night. In addition, organizational reputation helps to raise funds, which assists the NPO in their ability to aid displaced individuals.

## Involuntary Beneficiary: Individuals Struggling with Transition

Transition NPOs meet the needs of individuals who are in some type of transition in their lives. For instance, formerly incarcerated individuals who work with NPOs in order to reintegrate into society are an example of this type of beneficiary. These kinds of NPOs look for ways to help people adjust to their new situations and adjust to their respective communities. Transition NPOs often help individuals struggling with two different kinds of need – basic life needs and addiction support.

First, some transition NPOs focus on meeting the basic needs of individuals in crisis. For instance, re-entry NPOs work with incarcerated individuals as they exit jail or prison and attempt to acclimate to society. Support comes in various forms including counseling, gas cards, resume and interview training, interview clothes, housing recommendations, job connections, and the like. Interestingly, one of the greatest needs of parolees transitioning out of a county jail system is communicative support (Koschmann and Peterson 2013). In other words, involuntary beneficiaries

need social connections to link them to resources available in their community. Parolees need advocates and mentors to help them make a successful transition back into their communities as law abiding citizens.

The second kind of transitional NPO meets the needs of involuntary beneficiaries in the addiction community. Nonprofit addiction support organizations, like Celebrate Recovery, may be faith-based in nature. Addiction NPOs are often affiliated with churches, and thus, may have their own perspective on the idea of individual agency. Generally, faith-based addiction NPOs help beneficiaries recognize that have no power over their addictions but that there is a power out there who is greater and who is able to forgive. The ultimate goal of many of these programs is to pray for God's will to guide their steps and continually free them from addiction. Research supports that spiritually might be consequential in an individual's degree of success when it comes to resisting substance use (Brown et al. 2013).

Together, these transition NPOs support individuals who are quite literally, in transit, between a former life and a life that has yet to be realized. The NPOs are the lynch pins that hold these worlds together for involuntary beneficiaries and who help them to regain agency over the facets of membership.

## Challenges and Benefits of Working with Involuntary Beneficiaries

NPOs who work with involuntary beneficiaries experience the challenges and enjoy the benefits of such work. To begin, serving communities of involuntary beneficiaries can be difficult and challenging for several reasons. First, employees and volunteers likely engage in emotional labor in their roles. Emotional labor involves aspects to work in which organizational team members are expected to put on or enact a certain type of emotion when interacting with clients, customers, or in this case, involuntary beneficiaries, in order to meet their role expectations (Hochschild 1983). In order to perform appropriately, employees and volunteers have to engage in both surface acting, which involves changing their facial, outward expressions, as well as deep acting, which involves attempting to change their own thoughts. If NPOs do not support volunteer and employees who struggle with the emotional labor expectations, burnout could result. Second, often involuntary beneficiaries do not seek out partnerships with the aforementioned organizations, but rather these "memberships" are imposed upon them by the court, by other agencies, or even by family or friends. Accordingly, some of them enter these NPOs as antagonistic or perhaps simply apathetic participants. From a practical stand point, unwilling "members" are often resistant to change and less likely to adopt some of the self-enhancement strategies and practices made available to them.

Still, with all of the challenges, NPOs who serve involuntary beneficiaries also impart various benefits to society that make the work worthwhile. First, and foremost, NPOs create a "third space" that connects communities to larger institutions. These NPOs act as lynch pins or bridges that connect micro and macro levels of society and enable beneficiaries to more robustly participate in democratic engagement. Second, these nonprofits equip their beneficiaries with strategies for negotiating, managing, or reframing the stigma that comes with their involuntary membership. For instance, many parts of the country are seeing the emergence of empowerment NPOs. These nonprofits aid involuntary beneficiaries in recasting and envisioning themselves as having a voice and, in doing so, help them to reframe their own identities and to see themselves in new ways.

## Conclusion

In sum, this entry discusses the concept of involuntary membership as a unique perspective on individual-organizational relationships. Organizations which address health, displacement, and transition often serve involuntary beneficiaries who have little to no control over their own entry or exit from the organization. This presents

an opportunity for nonprofit organizations to consider the complex nature of what it means to belong to an organization and the varying degree of power or agency ascribed to individual members. In doing so, it describes three different kinds of involuntary stakeholders who are aided by NPOs including: (1) individuals struggling with health conditions, (2) displaced individuals, and (3) individuals in transition. It also highlights some of the challenges to working with involuntary beneficiaries, including the difficult emotion work that many NPOs have to manage. Finally, it touches on the benefits of serving involuntary populations. Overall, the entry summarizes how the scholarly community has started to recognize involuntary beneficiaries and highlights the uniqueness that transcends NPOs who serve these special populations.

# Iranian Energy and Environmental Policy: Investigation of Governance Frameworks

Rouhollah Shahnazi
Department of Economics, Shiraz University, Shiraz, Iran

## Synonyms

Energy governance; Environmental governance; Market failure

## Definition

Energy and environmental policies are related to sustainable energy development and environmental protection. These policies include national or international laws and regulations to encourage investment in the energy resources and environment, reduce energy consumption by improving productivity, develop renewable energy, reduce climate loss, waste management, ecosystem management, conservation of biodiversity, and protection of natural resources through subsidies, taxes, and other public policy techniques.

## Introduction

Economic governance, as a decision-making and implementation process, includes legal structures and social institutions to support economic activities and exchanges. The market system fails in the four areas of allocation, distribution, stabilization, and internationalization (Musgrave and Musgrave 1989; Cullis et al. 2009). Therefore, as shown in Table 1, the governance is limited to these four parts.

Due to monopoly, externalities, public goods, and asymmetric information, the market fails in allocation and the governance seems necessary. Distributive governance is essential for reasons such as unequal distribution of income, wealth,

**Iranian Energy and Environmental Policy: Investigation of Governance Frameworks, Table 1** Market failures in general and failures in the energy and environment

| | Permanent poverty in some countries | – | – |
| | Coordination of macro policies | – | – |
| | Global environmental damage | Y | Y |

and opportunities, and a lack of minimal social security system in the market. Moreover, regarding stabilization, due to recession, inflation, and lack of development program, economic governance is necessary. Internationally, the market is failing, including in protecting the global environment. Market failures are generally summarized in the first and second columns of Table 1.

Extensive studies have been conducted on the topic of environmental governance (e.g., Levine et al. 1994; Van de Graaf and Colgan 2016). In the third column of Table 1, based on the theoretical foundations as well as literature, shown in terms of the environment, environmental governance is essential due to externality effects, public goods, lack of a clear plan for development, and global environmental damage.

There are also several studies on the energy governance (e.g., Sandmo and Agnar 2000; Lihua et al. 2020). According to the results of these studies, as shown in the fourth column of Table 1, the environmental governance is essential due to monopoly, externality effects, unequal distribution of opportunities, lack of a clear plan for development, and global environmental damage.

## Iran's Regulations Related to the Energy and Environment

As shown in Table 2, in Iran, many plans, laws, and regulations have been approved and implemented in the environment and energy governance, the most important of which is the environment and energy sectors in the Iranian development plans. Implementation of development plans in Iran began in 1948. Up to now, 11 plans were designed and implemented. These plans include five prerevolutionary (1979) development plans, with a 10-year hiatus, and six plans after the revolution of 1979.

There have been 1368 multilateral environment agreements (MEAs) and 2264 Bilateral environment agreements (BEAs) from 1850 to 2020 in the world. Iran participated in 320 cases of agreements as described in Table 3.

## Iranian Environmental Governance

Table 4 presents the most important dimension of environmental governance in Iran's development plans. The information shows that

between the 11th National Development Plan and the previous ones is that in this plan, the environment is one of the important axes of the plan. The Eleventh Plan pursues three important goals in the environmental governance, that is, reducing the emission, preventing environmental degradation and pollution, and preserving and restoring biodiversity. Regarding the reduction of pollutant emissions, four strategies are being pursued in the Eleventh Plan: development of a low-carbon economy, development of green technologies, improvement of climate quality, and control of greenhouse gas emissions. Seven policies related to reducing emissions in the Eleventh Development Plan are financial and monetary instruments to reduce greenhouse gas emissions, develop vegetation to absorb greenhouse gases, develop greenhouse gas absorption technologies, increase Iran's capacity to attract international financial aid, low-interest loans for green activities, and development of clean and nonpolluting technologies. Other solutions presented in the plan include facilitating greenhouse gas emission reduction technologies importation, controlling municipal waste disposal sites to reduce methane emissions, feasibility of injecting greenhouse gases deep into the earth, and imposing a greenhouse gas emission tax.

Currently, the most important infrastructure for the environmental governance in Iran is the general environmental policies. These policies include:

1. Comprehensive, coordinated, and systematic management of vital resources based on the strength and sustainability of ecosystem (stabilization – lack of clear plan for development)
2. Creating an integrated national environmental system (Stabilization – Lack of a clear plan for development)
3. Improving living conditions in order to provide society with a healthy environment and respect for intergenerational rights (distribution – unequal distribution of opportunities)
4. Preventing the spread of all kinds of unauthorized pollution and criminology of environmental degradation (allocation – internalization of external effects)
5. Continuous monitoring and control of sources of air, water, soil, and noise pollution (allocation – internalization of external effects)
6. Preparation of the country's ecosystem atlas and protection, restoration, improvement, and development of renewable natural resources (stabilization – lack of clear plan for development)
7. Management of climate change and response to environmental threats such as desertification, dust, drought, and microbial and radioactive contagious agents, and the development of foresight and knowledge of emerging environmental phenomena and its management (stabilization – lack of clear plan for development)
8. Development of green economy (allocation – internalization of external effects).
9. Groundwater protection (stabilization – lack of a clear plan for development).
10. Establishment of environmental auditing system (allocation – internalization of external effects)
11. Supporting and encouraging investments and environmentally friendly technologies by using appropriate tools such as green taxes (allocation – internalization of external effects)
12. Compilation of the Charter of Environmental Ethics and promotion and institutionalization of environmental ethics based on the Iranian-Islamic values (stabilization – lack of clear plan for development)
13. Promoting scientific research and benefiting from environmental technologies (allocation – public goods)
14. Expanding the awareness and knowledge about the environment (allocation – public goods)
15. Strengthening Environmental Diplomacy (International – Global Environmental Protection)

**Iranian Energy and Environmental Policy: Investigation of Governance Frameworks, Table 5** The most important aspects of energy governance in the postrevolutionary development plans

| | Articles | |
|---|---|---|
| Sixth Development Plan | Section 4–454–49 | Replacing natural gas with petroleum products and other energy fuels<br>Energy efficiency and energy saving policies |
| Seventh Development Plan | Articles 19, 82 | Energy saving<br>Revision of consumption pattern and reduction in fuel pollution<br>Changing consumption patterns, increasing energy efficiency and using clean energy |
| Eighth Development Plan | Articles 119 to 123 | Energy saving<br>Development of criteria and technical specifications related to energy consumption<br>Adhering to energy consumption standards |
| Ninth Development Plan | Articles 3, 7, 59 | Increasing energy efficiency<br>Providing necessary resources for the development of renewable energy<br>Energy consumption management |
| Tenth Development Plan | Articles 125, 129, 133, 134, 135, 139, 148, 168, 190 | Preparation of national energy strategy document and executive plan of comprehensive energy plan<br>Reducing energy intensity<br>Variety in energy<br>Guaranteed purchase of electricity from clean energy sources<br>Reducing energy losses<br>Preparing a plan for the use of nuclear energy and renewable energies<br>Modifying the energy consumption pattern and managing energy consumption |

## Iranian Energy Governance

Table 5 presents the most important aspects of the energy governance in the postrevolutionary development plans. In the recent Plan, more attention has been paid to the energy governance. In the Eleventh Development Plan, aspects such as energy management, energy intensity reduction, energy loss reduction, comprehensive energy planning, and development of nuclear and renewable energy have been considered.

Currently, the most important legal infrastructure for the energy governance in Iran is the National Energy Strategy Document. This document, approved by the Cabinet on 4/28/2017, is a comprehensive document for managing energy sector in the horizon of 2041. The strategies of the energy sector in this document and their relations with the energy governance sectors are approved as follows:

- Elimination of energy carrier subsidies (stabilization – lack of clear plan for development)
- Reduction of waste in production, transmission, distribution, and energy consumption up to the national standards (allocation – externalities)

**Iranian Energy and Environmental Policy: Investigation of Governance Frameworks, Table 6** Summary of energy and environmental policies in Iran

| dimensions | Minor dimensions | Plan |
|---|---|---|
| Allocation | Externality effects | The sixth, eighth, ninth, tenth and eleventh plans |
| | Public goods | The seventh, eighth, ninth, tenth and eleventh plans |
| Distribution | Unequal distribution of opportunities | – |
| Stabilization | Stagnation | – |
| | Lack of clear plan for development | The sixth, seventh, eighth, ninth, tenth and eleventh plans |
| International | Global environmental damage | Membership in 320 Global Agreements |

- Supporting the development of applied research, production of technical knowledge, and commercialization of new technologies (allocation – public goods)
- Commercialization of renewable and environmentally friendly energy technologies (allocation – externalities)
- Reducing greenhouse gas emissions and pollutants from the production, transmission, and consumption of energy carriers (allocation – external effects)
- Collection, processing, or conversion of maximum associated and burning gases with economic and environmental considerations (allocation – external effects)
- Increasing the share of renewable and clean energies in the electricity generation capacity (allocation – external effects)

## Conclusion and Discussion

An investigation of Iran's energy and environmental policies shows that, as shown in Table 6, appropriate policies have been implemented in Iran for reducing external impacts, public goods, presenting an energy and environmental plan, and paying attention to the Global environment.

On the other hand, according to the evidence, Iran is the sixth country with the highest energy intensity in the world after Ukraine, Russia, Venezuela, Taiwan, and South Africa. This shows the very low efficiency of energy consumption in Iran. In terms of $CO_2$ emissions in the world, Iran is the seventh country with the highest $CO_2$ emissions after South Africa, Kazakhstan, Taiwan, Russia, Ukraine, and Venezuela (https://yearbook.enerdata.net/). This, again, shows that the performance of environmental governance in Iran has been weak. Therefore, lack of implementation policies has caused Iran to be unsuccessful in the environmental and energy governance.

Studies showed that despite extensive and long-term policies in the environmental protection and energy, the most important environmental and energy challenges in Iran are still:

High losses in the production, conversion, and supply sectors of energy
Lack of appropriate market mechanisms in the energy supply
Restrictions on the access to international financial resources
Restrictions on the access to new technologies
Insufficient nongovernmental investments in the energy sector
Small share of renewable and clean energy
Lack of financial resources for the development of energy projects and environmental protection
Lack of an independent regulatory in the energy sector
High emissions of air pollutants
High-energy intensity

These challenges are related to the gap on the implementation of policies.

# Iraq's Pressing Need to Adopt Unified Conceptual and Procedural Models for Public Policy Making, Implementation, and Evaluation Processes

Kaa'ed A. Ali Al-Hashimi
Baghdad, Iraq

## Synonyms

Improvising in public policy making; Personal and political interests in public policy making; Public policy; Public policy making; Rational and productive public policy

## Definition

Public policy is whatever approaches a government and/or its branches adopt to address public issue(s).

## Introduction

In spite of the confusion that can be caused by the so many definitions in the literature, public policy can be simply defined as whatever approaches a government and/or its branches adopt to address public issue(s). In a logical chain of cause and effect, successful policies often produce successful solutions and, therefore, result in citizens' satisfaction. A major factor to influence whether a policy would succeed or fail is the way that that particular policy is made/formed. That way or methodology is often called public policy making process, and it is closely related to and influenced by the characteristics of the political ideology adopted by governing bodies (Buşoi 2010). Public policy making process in democratic countries, for instance, is often characterized by being participatory, whereas totalitarian governments tend to adopt more centralized process of policy making. In addition, to make public policies, governments tend to justifiably follow either specific models or cycles of policy making process, or they just let policy drafters and policy decision-makers adopt whatever methodologies they prefer. The latter approach often results in policies that serve individuals' or specific groups' interests and/or comply with the pressures under which those policy decision-makers run their offices such as in the cases of many undemocratic countries. Therefore, it's fairly axiomatic to say that following a proper public policy making model would result in proper approaches, alternatives, and solutions (policies), whereas improvisation by individuals would, on the other hand, result in improper policies.

A close look at the Iraqi legal framework shows that the accountability system in the public sector is entirely focused on combating corruption, whereas poor performance in managing public affairs is almost ignored. The absence of the

needed legal texts to hold Iraqi official decision-makers responsible for the effectiveness of the public policies they adopt can be easily noticed. In addition, findings of a specially customized needs assessment survey conducted in six Iraqi ministries by an international administrative reform project showed that Iraqi officials do not follow any specific model for public policy making process; instead, they just improvise, enjoying the unaccountability provided by the absence of any relevant legal text. However, a very simple pattern could be observed when analyzing various cases of real public policy making by Iraqi governmental organizations. After examining the observed pattern of public policy making in Iraq and comparing it to some of the well-established models adopted by various developed and underdeveloped nations, Iraq's federal and local governments are invited to adopt a specially customized model for this purpose. The suggested conceptual model holds some essential characteristics that match the constitutional, political, and legal mandates of the governments of Iraq. These characteristics include, but not limited to:

- Participatory that goes hand in hand with the democracy and transparency mandated by the constitution and law
- Thorough and comprehensive research for which substantial time and efforts are dedicated to analyze public issues
- Scientific evidence-based formulation of policies
- Objective and scientific evaluation of adopted policy's direct outcomes and long-term impacts where established indicators and indexes are used

As this conceptual model is recommended to be adopted as a general framework for public policy making process in Iraq, a procedural model that consists of specific practical steps is developed and recommended to be adopted as an interpretation of the conceptual one. These practical steps were designed based on a full understanding of the administrative and financial laws, regulations, and practices followed in Iraq's public sector. This claimed understanding of how Iraqi governments and their branches are functioning was established through many years of experience working in and close to governmental offices in this country.

## Public Policy Making in Iraq

### Legal Framework of Public Policy Making in Iraq

The legal framework through which Iraqi officials are performing their duties consists of 27,543 legal texts (Constitutional Articles, Laws, Diwany Decrees (Decrees by the Council of Ministers.), Regulations, etc. (Iraqi Legal Database/ILD was created by the UNDP Iraq in cooperation with the Supreme Judicial Council of Iraq and the Iraqi Ministry of Justice and can be browsed through http://www.iraq-ild.org)). Although some of these legal texts were designed to explicitly limit and clarify the financial authorities in different levels of the decision-making in Iraq governmental offices, none of them imposes or suggests any criterion as of what methodology should be adopted to address public issues. One could observe that the term "public policy" is mentioned in many of those texts, but phrases such as "good public policy making process should be…" or "the criteria of public policy making process are" never show up. For instance, some of the currently effective constitutional articles (78, 80, 110, 112, and 114) merely refer to the ownership of public policy making and implementation. In other words, they assign responsibilities of who should create policies in specific areas and who should implement them. Neither these articles nor any other legal texts discuss the nature or the characteristics of the approaches that the governmental offices should follow when drafting, adopting, or implementing public policies. Another example would be those legal texts that regulate public budget execution such as the amended Law #28 (1940). (Law 28/1940 of "the Principles of Public Accounting.")Those legal

texts explain and impose financial authority specific ceilings for all governmental offices to consider and limit their budgets within when implementing policies, but these legal texts, once again, never mention specific methodologies for formulating policies or specific instruments for implementing or evaluating them.

While assigning public policy responsibility and ownership is poorly addressed by only some of the texts of the Iraqi legal framework as mentioned, evaluating public policy's impact and effectiveness is not mentioned at all. It is strongly believed that ignoring this crucial aspect of public policy making process affects the overall accountability system negatively and, hence, encourages, if not causes, poor performance in public sectors (Atkinson et al. 2007; Fox and Butler 2004). Unfortunately, there is no reason to believe that Iraq's public sector is an exception for this rule of thumb. The findings of the needs assessment survey mentioned earlier showed that almost all the governmental organizations of Iraq have specific offices within their organizational structures to perform various monitoring tasks, but these tasks are merely for monitoring by which progress in projects and plans implementation is reported to make sure that original plans are strictly followed. Outcomes and effectiveness of plans are completely out of the scope of these monitoring offices spread all over Iraq's public sector.

## Actual and Current Life Cycle of Public Policy in Iraq

Although called here a cycle, it is actually never a cycle in Iraq because there isn't a recognized phase of policy evaluation at all. Once a policy reaches an implementation phase, it stays there. It's true that many policies (specifically legislations) have been revised and amended, but this happens only when interests of very powerful entities get in conflict with those specific policies.

To figure out the exact types of issues and where they lay within the public policy making process in Iraq, it is very necessary to understand the basic and standard stages that any Iraqi public policy would go through during its life cycle. Interestingly enough, regardless of the economic ideology and the political governing approach adopted by governments of Iraq, public policy normally passes through the basic phases described below:

- **Public Issue Occurrence or Higher Agenda Adoption**: Public issues are whatever concerns that affect or may affect the majority of the population of a community. These issues can be public problems such as an occurrence of an infectious disease among a population of a specific area with a good chance to be spread out all over. On the other hand, public issues can also be public opportunities such as discovering a vein of gold or an oil reserve of commercial amounts or an unexpected climate change where a substantial increase in rain occurs in a country that is used to have dry seasons. All these kinds of public issues normally require adopting public policies to address them. Another possible trigger for the public policy life cycle would be the adoption of a broader national policy on the level of the central or federal government. Ministries, provinces, and departments normally consider sectoral or local public policies to implement the national policies adopted by federal or central government offices.
- **Reporting the Public Issue and Agenda Setting**: A media report or an official memorandum from a concerned individual(s) or a public or private agency normally reports the occurrence of the public issue to authorities. Or, according to the other scenario, the central government office communicates the adopted national policy to its branches for implementation. An essential decision should normally be made in this phase to continue or to end up the public policy life cycle at this point. A policy advocate usually tries to emphasize the importance of a specific policy and to insert it into the agenda of responsible organization(s). Authorities decide on the importance of the issue, that is, whether to ignore it or to address it as an

important public issue. (This happens usually when authorities consider the emerging issue as a nonpublic issue, meaning that they decide that it doesn't belong to the public; rather it belongs to a specific group of people such as a corporate in the case of corporate issues and policies.) If authorities find the emerging public issue significant and important enough, some advisor(s) would be assigned to look at the situation and develop recommendations. This step is considered an official checkoff of the public policy making process. Another possibility – occurring in many real-life situations – is that nobody is assigned to study the situation and do this job. Instead, decision-makers simply leave doors open to any suggestions by anyone within the senior management of their organization.

- **Policy Formulation and Policy Decision-Making**: In this phase, one can easily observe the lack for most of the democratic, logical, and scientific practices applied by governments of developed nations that approved to emphasize good governance. Some advisor (s) is usually assigned, as mentioned, to study the situation, formulate alternatives, and recommend one of them as the best solution. After reviewing a huge number of policy proposals and memos, one can say that rarely any real consultation or a scientific research has been ever conducted by assigned policy drafters for this purpose. And hence, scientific evidences and numeric facts are not essential parts of these policy proposals. Sensitive issues, such as security, defense, and many others, and pertaining policies are usually centrally addressed and formulated by personnel in the highest authorities. The outcome of this phase is a set of alternatives with one as the most recommended. This could be presented though a white paper (policy proposal) attached to a policy memo, or even through one simple immature memo. This whole phase of policy formulation is sometimes severely shortened by a decision-maker deciding on what to do regarding an emerging public issue without any thorough thinking, analysis, or consultation. After submitting policy proposals, decision-makers make their minds. They either go for what is recommended, or they got inspired by the alternatives presented and come up with unlisted solutions (this includes the alternative of ignoring the public issue and keeping things as they are – the status quo).
- **Policy Implementation**: In this phase, adopted policy is to be implemented. It may be proposed to be drafted and passed as a law or an administrative decree first to legitimate policy implementation. A governmental entity(s) is usually assigned the responsibility of implementing the adopted policy with a given time framework. Depending on how broad is the policy, implementation may go through translating the adopted policy into programs and each program into projects. People of this country rarely heard a public organization's spokesman talking about a policy outputs, outcomes, and desired impact. Most of the organizations in the Iraqi governments implement whatever policies they are assigned just to comply with orders, and never showed deep understanding of policies' short- and long-term targets. This phase is normally the last one in public policy life cycle in Iraq because there isn't a recognized evaluation phase after it.

**Example Case 1: The Ministry of Electricity's Policy to Address the Shortage in Power Provision**

**Policy owner**: The Ministry of Electricity in Iraq

**Time frame**: 2004–2012

**Brief background**: The Gulf War of 1991, 1990s' economic sanction, and 2003 war have caused serious damages to the electric power supply system in Iraq. Whereas demand to power substantially increased as the population grew, power supply severely decreased due to wars, aging, and lack for proper maintenance. The Iraqi government/Ministry of Electricity had to deal with a huge shortage in power provision necessary for homes and industries.

In spite of all the calls to liberate this sector, the federal GoI decided to keep its full control on the national power system starting at production down to low voltage distribution, and not to allow private businesses to participate. And to address the power supply shortage in Iraq, the MoE fluctuated since 2004 from one approach to another without achieving the target. Most of the time, the focus was on the supply side (power production), completely neglecting the demand side (consumption). One time, the ministry focused its resources and allocations on gas turbine projects to increase the amount of electric power produced and supplied and therefore made what's called the MEGA DEAL with GE and SIEMENS in 2008 to provide a huge number of gas turbine units. Somewhere in the middle of the implementation of its policy, the ministry shifted its focus toward projects of diesel generators of the lower capacity but quickly installed units. The MEGA DEAL was frozen until 2011 when a newly appointed minister decided that the ministry should resume its original plan of the MEGA DEAL and to abandon the diesel generators ambitious plan. In mean time, the ministry awarded some contracts to provide and install steam turbine power plants as well. In addition, every now and then, the ministry of oil kept announcing its limited ability to secure the needed amounts of the needed types of fuel to operate those power plants. After spending $27 billion of its annual allocations in the Iraqi national budgets of the years between 2004 and 2012, the Ministry of Electricity failed to properly address this deteriorating public issue. (According to the Iraqi Minister of Finance, Dr. Rafi Al Essaw's announcement in 2012.) In summer 2012, the power provision rates barely reached 40% of the demand.

**Case Analysis**

For its huge influence over every single aspect in Iraqi citizen's life, this issue was almost always in the priority lists of the governments of Iraq. No team was specifically assigned to address this issue; instead, successive ministers of electricity kept discussion and suggestion doors open to their senior management personnel, and nobody else. Those senior officials, without any deep scientific analyses, formulated and suggested various alternatives, and the ministry was jumping from one to another. The ministry never consulted citizens, university specialized professors, specialized consultancy companies, or think tanks. Under the absence of any kind of policy evaluation systems that can hold decision-makers responsible for their decisions, personal interests and political influences played a great role in shaping the ministry's policy decisions. Influential personnel barely avoided clear and easy-to-be-caught corruption. The ministry has been implementing various alternatives since then without achieving its targets.

**Example Case 2: The Policy of Nineveh Province to Address the Issue of High Rates of Primary School Dropout in the Province**

**Policy owner**: The local government of Nineveh province, northwest Iraq

**Time frame:** 1996–2001

**Brief background**: In July 1996, a national daily newspaper carried a column about an official report belonging to the directorate of education in Nineveh province announcing unprecedented rates of primary school dropout in the province for the year 1995–1996. The dropout rate in that specific year reached 15% (overall – boys and girls, grade 1 throughout grade 6), whereas that same indicator used to fluctuate below 4% in the 1980s and between 7% and 11% in the early 1990s.

Under some pressure from the central government in Baghdad, the governor of Nineveh decided that the issue was an important public issue and deserved to be addressed. He assigned one of his assistants – who was a powerful politician but with modest educational qualifications – to study the situation and come back with suggestions. The governor's assistant had one phone call with the head of the directorate of education, read few pages from the official report, and had a brief discussion with some of his colleagues in Nineveh head quarter of the ruling political party. After

2 days from receiving his assignment, the governor's assistant submitted a two-page memo that repeated parts from the official report and offered only one alternative. That policy memo suggested reenforcing Law 118 (of year 1976) of the compulsory education by assigning the staff of the ruling party in the province (who used to serve as an additional security system in the whole country) to track down parents of the students who dropped out school. The governor adopted that suggested policy and sent a request in this regard to the Nineveh head quarter of the ruling party. In August 1996, the assigned political-security staff started a campaign of tracking down and following up parents and families of students who dropped out elementary school last year. The directorate of education recorded some increase in primary school re-enrolment rates for the period from the beginning of the academic year 1996–1997 to the midterm examination of the same year. The annual report issued in July 1997, however, reported even higher rates of dropout in the elementary school because the high pace of following up and tracking down families remained for only 3 months. As the ruling party took over the responsibility of every aspect in the country, nobody followed up the implementation of the adopted policy. The assigned political-security staff started to mellow in doing this job as more assignments were given to them every day. Reenforcing Law 118 was the officially adopted policy of the governor and his administration until he was replaced by another governor in 2001. Dropout rates in elementary schools in the province were reported between 16 and 19% in the following years up to 2001.

**Case Analysis**

This is another typical case of policy making in Iraq. One single individual was assigned, without considering his actual qualifications, to address a very important public issue. And typically, no really relevant research and/or consultation were conducted. Immature single alternative was developed and adopted in the absence of any scientific evidences or analyses. As no evaluation is requested by any regulations, nobody measured the direct results and impacts of the policy under implementation, thus the policy stayed in the implementation phase wasting public resources just for nothing.

## The First Relevant Survey: Its Findings and the Process Analysis

A customized survey was conducted during the 1st half of 2012 by an international development organization to assess the process of public policy making in Iraq. ("Iraqi Ministries' Needs Assessment – for Public Policy Bureaus " by TARABOT (a USAID Iraq Project.)) Sixty-seven official Iraqi decision-makers from six selected ministries participated in answering the survey's questionnaire. The questionnaire was composed of 103 open-ended and multi-choices questions distributed on three major parts:

1. *Part One*: **Elements of Public Policy Making Process**
   - Policy priority setting
   - Participation in the central annual planning for government's program
   - Preparations for policy proposals
   - Preparation for legal drafts
   - Intragovernmental consultations
   - Submission to government office
   - Review by government office
   - Review by ministerial committees
   - Decision by the cabinet
   - Parliamentary process and passage
   - Policy implementation
   - Policy evaluation
2. *Part Two*: **Thematic Issues**
   - Stakeholder consultation
   - Strategic communication
   - Evidence-based policy making
   - Administration and financial management of policy
   - Policy evaluation
3. *Part Three*: Participants' **Recommendations**

Although biased answers were extremely difficult to avoid due to specific political and cultural attitudes, the questionnaire findings generally

supported this paper's hypotheses regarding the deficits in the process of policy making in Iraq. These findings basically illustrated that the way public policy is currently made in Iraq obviously lacks for some elements that are crucially important for any rational policy making process to produce sound and practical alternatives to address public issues. These elements were:

- **Participation and Inclusiveness**

  It's found that Iraqi policy makers rarely consult other stakeholders while forming public policies. It's neither mandatory by laws nor a habit by nature for Iraqi policy drafters and decision-makers to consult anybody out of their much closed loops (if any) when running their businesses in the government. Putting aside the corruption that requires keeping control in hand, a number of recognized cultural and psychological factors are also encouraging the tendency of Iraqi officials toward severe individualism in performing their assignments. Political complexities are another worsening factor where officials tend not to trust opponent or differently affiliated officials. Corruption that requires keeping things under personal control is another one. Now, this is being said, and considering the absence of any legislation that imposes transparency and integrity in policy making by publicizing all relevant information, consulting other stakeholders, and/or reflecting as much opinions as possible on the formulated and recommended alternatives, a simple logical question emerges – *what would make any Iraqi official ask other stakeholders about their opinions?* The answer is simply "nothing."
- **Thorough and Comprehensive Research**

  If quite few Iraq policy makers would include some stakeholders from around their closed circles, almost none of them tend to conduct a thorough and comprehensive research while considering different alternatives to address public issues at hand. This was obvious and one of the major findings of the survey. As scientifically evidences-based formulation of policies could be the most time-/effort-consuming phase of the proper policy making process, and under the shade of the absence of any relevant accountability legislation, why should the Iraqi nation expect any Iraqi policy maker to take this burden?
- **Policy Post-implementation Impact Evaluation**

  None of the survey findings clearly referred to a formal and documented process of objective and scientific evaluation of the direct outcomes and long-term impacts of adopted policies for which established indicators and indexes are used. This is clearly related to the absence of any accountability legislations that usually impose such an evaluation. Although usually requires some resources to be conducted, such an "impact evaluation is the needed incentive to put more efforts in research and studying public issues" (Kovacic 2005) and hence is very crucial for a healthy policy making process. And with the absence of such evaluation, who of the Iraqi policy making entities and individuals would take the burden of revising their already adopted policies?

## Proposed Conceptual and Procedural Models

Since the emergence of public policy as an academic discipline that stands by its own, many public policy making models have been suggested to explain the process. Each model suggests following specific steps such as those of Cochran et al. and Palumbo et al. of the four basic stages – agenda formation, policy adoption, policy implementation, and policy review (Cochran et al. 1982; Palumbo et al. 1981). Another example would be the eight-step policy cycle suggested by Althaus et al. 2007 in their book titled *The Australian Policy Handbook*. This model includes issue identification, policy analysis, policy instrument development, consultation, coordination, decision, implementation, and evaluation. Although this suggests different steps and various life cycles, those models and almost all other models in the literature actually present similar

themes and basic concepts. Those themes typically include participatory approach that is driven by believing in democracy, emphasis on transparency, and result-oriented effort. Now, considering the political, cultural, administrative, and legal circumstances through which public policies are made in Iraq, a specially customized conceptual model is suggested to be adopted by Iraq's federal and local governments for their policy making process (see the Fig. 1). This model suggests specific stages to be considered by governments after the decision has been made to address a public issue, meaning that the model assumes that the public issue has occurred, it's already on the government agenda, and some advisor(s) has been assigned to develop a white paper to present available alternatives to address that public issue.

The various roles suggested by this model are supposed to be distributed among the policy drafters, policy decision-makers and legislators, policy-implementing organizations, and policy-evaluating independent parties to insure the integrity of each separate phase. According to this model, assigned policy drafters should first clearly identify public issues and then create a comprehensive understanding about their roots, dimensions, and possible solutions. An objective scientific research should be conducted for this purpose in this phase. Then, the drafters along with decision-makers should correctly identify all the stakeholders of each specific issue and start consulting them and collecting their perspectives. This step would ensure that nobody would be "taken aback" when a policy is announced. A health environment for the needed political support, moreover, can be established through the discussions that occur during consultations. Based on the understanding created so far, some alternative should be properly formulated and supported by a cost-benefit analysis. The ultimate result of this phase should be a well-written firm policy paper that provides all needed information about the public issue in addition to recommended solutions and alternatives.

The ball now is on the court of the decision-makers who have to decide on what to do regarding the public issues at their hands. Decision-making process, by its turn, has been widely studied by sociopolitical scientists. Several theories have been developed to explain how decision is made in public sector. There are, for instance, the rational-comprehensive theory, the incremental theory (Anderson 1999), and the mixed-scanning theory (Etzoni 1967), each with specific assumptions and results that are widely elaborated elsewhere. This phase produces a policy decision that chooses one of the recommended alternatives by the submitted white paper, or even to come up with a new alternative that is driven out from the original policy analysis. Before the implementation phase starts, the decision made is to be interpreted into a proposal of a law, decree, or any form of legally binding declaration.

The law or legislation to be suggested should articulate assigning implementation responsibility to some implementing organization. The implementation phase can be the most time- and resources-consuming phase. And implementation can be as complicated as creating programs and projects and can be as simple as just granting country access (visa) to the citizens of a friend nation. High-level plans – at least – for policy impact evaluation should be placed early in the public policy making process, and detailed action plans along with firm grounds for the evaluation phase should be set during the implementation phase. Normally, and regardless of the political forms of the governing regimes, any policy making process of any nation has some kind of implementation phase; what really makes a difference is the impact evaluation (for the adopted policy) and performance evaluation (for policy implementation). Although very significant for policy effectiveness and efficiency, the performance of implementing organizations should not be considered part of the policy making process; it's normally an important administrative aspect that has to do with another field of public administration, that is, organizational performance. On the other hand, policy impact evaluation is crucially important to enforce the integrity of all previous stages of policy making process.

Obviously, the suggested conceptual model provides broad titles and descriptions of the phases that public policy making process should pass through. Therefore, as official public policy

**Iraq's Pressing Need to Adopt Unified Conceptual and Procedural Models for Public Policy Making, Implementation, and Evaluation Processes, Fig. 1** Suggested conceptual model

**Iraq's Pressing Need to Adopt Unified Conceptual and Procedural Models for Public Policy Making, Implementation, and Evaluation Processes, Fig. 2** Suggested procedural model

drafters and decision-makers normally need more time-framed, specific, and detailed description of the steps they would be asked to follow, a detailed procedural model is suggested for practical application. Such a procedural model can be legislated to be a legally binding policy making process; otherwise, it is not guaranteed or even expected at all that Iraqi policy makers would collectively volunteer to adopt a completely different work style that they never adopted before. As concepts, in addition, are merely here for providing general layouts and guidance, presenting the conceptual model is not sufficient enough to enhance the policy making process in Iraq. The outline-providing conceptual model needs to be interpreted into the procedural model that can be clearly and effectively imposed by acting a low or any kind of legislations. Directly driven from the mother conceptual model, the procedural model is suggested to have the shape and content illustrated by the Fig. 2.

In addition, a standard checklist form that includes fields for detailed descriptions, justifications, and notes is suggested to avoid different interpretations, to simplify the implementation of the model, and to provide a measuring and evaluation criterion for accountability purposes. The first two pages of the suggested additional form are to provide information about policy drafters, sponsoring office, level and rank of the needed decision-making process, background description, legal references, etc. The following pages are to include itemized table fields to provide information regarding the standard steps that the procedural model suggests. This information should include dates at which each step was conducted, full description of the course of actions taken, and justifications for any variations provided.

## Definition

*Islam, Governance, and Political Culture in Bangladesh:* To examine the relations between Islam, governance, and political culture in Bangladesh, this entry portraits the contextual framework of governance and political history of Bangladesh and how it has correlations with Islam. This is done by observing the nature, relations, and processes of the historical development of Islam and politics in Bangladesh with the characteristics of Islam and democratic political culture in Bangladesh; in doing so, this entry, finally, aims to examine the convergence and contradiction of Islam in the political sphere of Bangladesh and how Islam, governance, and politics are inextricably interconnected and knotted in the political history of Bangladesh.

## Introduction

Islam, a religion of peace, has deep roots in the nature, functions, and performance of the governance and political culture in Bangladesh. Islam, by nature, absorbed and reflects the general norms of the peoples of Bangladesh, which predominantly covers the social, political groups' activities, and "state's behaviors" (Nyadera and Islam 2020a) directly or indirectly. In the domain of politics, Islam, as a religion, significantly influenced the governance and political culture of Bangladesh which arguably is considered as "secular" in state level (though in the constitution, Islam is the state religion in Bangladesh) but religious (Believer) in "personal/individual" level mostly. Islam, through its huge stimulus, has always been linked with a multi-colored inextricably sociopolitical impact on Bangladesh, in its cultural, social, economic, political, and democratic transition and crisis. From grassroots politics to state politics, from top to bottom policymaking level, indistinguishably, Islam was able to make a new image and has a vast contribution to the historical evolution of Bangladesh. Additionally, Islam, in its culturally comprehended roots, has a great influence on the mystical spiritual legacy and history of the political culture of Bangladesh in a constructive and viable process.

As a tool of political back up, Islam has played an important role in Bangladesh since its inception in 1971. This has occurred through its role in different political frameworks including the secular, socialist, and the nationalist, whether in the regime of the democratic, autocratic, or military. It has also had its impact on the democratic

transition process in Bangladesh, and exists as a vital instrument in the political process, scope, and struggle for the influence of the masses of Bangladesh to achieve the interests of the political parties. Ultimately, it is integral to the role model for their political goals where pursuit of power is the central objective.

Nevertheless, Ahmed (2010) well defined the meaning of "Islam," as he highlighted that Islam refers to peace by one's submission to Allah; similarly, Stevenson (2010) defined "Islam" in Oxford Dictionary of English as "the religion of the Muslims, a monotheistic faith regarded as revealed through Mohammad as the Prophet of Allah" (p. 926). It is well-established that "Islam," as a "Deen" (religion), came to the land of Bengal by the Turkish conqueror Ikhtiyar Uddin Muhammad bin Bakhtiyar Khilji in the beginning of the thirteenth century (Islam 2017b). Rahim (1963) and Khan (2013) assert that Islam came to the land of Bengal through the "Sufis, Saints, and Merchants". Although Nazrul Islam and Saidul Islam (2018) have argued that Islam and political triumph assist the Muslims in spreading their religion in the land of Bengal, Karim (1959) on the other hand highlighted how Mosques, Madrasas, and Khanqas of Sufis and Saints played foremost efforts regarding spread of the actual phenomena of Islam in the sociopolitical scenario of Bengal and current Bangladesh.

Historical-based literature and scholars on "Islamization in Bengal" like Arnold (1913), Habibullah (1945), Karim (1959), Qureshi (1962), Rahim (1963), Ahmad (1964), Tarafdar (1965), Nizami (1966), Mujeeb (1967), Rashid (1969), and Haq (1975) argued that people in Bengal embraced the religion of Islam over Hinduism and Buddhism (especially the lower-caste Hindus) because they want freedom and social liberation, which came through the Sufis, Muslim traders, and saints of Islam. Accordingly, they captured the Bengal people's heart and mind; however, some scholars including Muir (1963), Chatterji (1963), and Majumdar (1973) stressed that the process of "Islamization in the land of Bengal" is through the way of power, sword, what they argued as the "forced conversion theory" in the case of Islam as the religion in Bengal area.

This study, therefore, seeks to examine the relations between Islam, governance, and political culture in Bangladesh in general. It aims to highlight how relations between Islam and politics might influence the politicians in Bangladesh to formulate and implement the political party's interests in any sphere for political goals. It identifies that Islam, as a religion, may have profound impacts on politicians, policymakers, and mass people in general but may have different challenges, convergence, and contradictions in the political sphere and landscapes on the political culture of Bangladesh. As Nyadera and Islam (2020b) argued, "significant changes experienced at the domestic and international levels have compelled scholars and practitioners to rethink the different dimensions in theoretical and practical application."

## Contextual Framework: Islam, Governance, and Political Culture in Bangladesh

### History of Islam and Politics in Bangladesh

Islam arrived in the land of Bangladesh through peaceful means, mainly through merchants and preachers, and flourished over time to include a significant part of the population. Long before the setting of Muslim empires in the region at the beginning of the thirteenth century, Islam was spreading among the population rapidly through means of proselytization from as early as the eighth or ninth century.

One can look at several ways in which Islam began to be spread in the region now known as Bangladesh (Bengal region). Arab merchants are known to have preached Islam in the Bengal region from early on. In Bengal, the main hub for merchants and their trade activities was the port of Chittagong. Alongside that, the port also functioned as a prime spot for trade with the

eastern regions such as Indonesia, Thailand, Malaysia, and China. As a result, traders often used to run their businesses to and from mainland China through the port of Chittagong. Arab merchants were known for their economic activities through this route since pre-Islamic times. After the rise of Islam in Arabia, the Arab merchants played an important role in preaching Islam in the Bengal region. Furthermore, some of these Arab Muslims settled in communities in the coastal regions of Chittagong, which gradually became centers for disseminating the message of the new faith.

One can also find related historical accounts of rulers working towards preaching Islam, some peacefully and others through conquest. The Chera king Cheraman Perumal, who was the ruler of one of the coastal kingdoms in Kerala, is said to have converted to Islam during the lifetime of Prophet Mohammad. As a result, his kingdom became a point from where Islamic preachers went about proselytizing, with Bengal being one of the target regions for these preachers. Current historians, however, have contested the claim revolving around Cheraman Perumal and attributed his story more as being part of folklore than historical reality (Parthasarathi 2016). In the early eighth century, the conquest of Sindh by the Umayyad general Mohammad Bin Quasem also heralded a new era for expansion of Islam into the region, as many Muslim preachers travelled to Bengal to preach Islam.

The Muslim conquest of Bengal by Bakhtiyar Khilji heralded the arrival of political Islam into the region at the beginning of the thirteenth century. Khilji established his kingdom at Nadia, with its capital as Lakhnauti. This development opened up Bengal, both in terms of political terrain and society, for Muslim rule. It led to the arrival of a large number of immigrants from Muslim lands such as Arabia, Central Asia, and Persia to Bengal, many of them mystics and preachers (Karim 2007, p. 48). The Muslim political presence continued nearly unabated through several ruling families till 1757, when forces led by the British East India Company defeated the last independent Nawab of Bengal Siraj-ud-Daulah through a combination of treachery and cunning. This defeat led to the onset of two centuries of colonial rule in Bengal, which was synonymous with not only economic exploitation but also social displacement of former mostly Muslim elites.

Nevertheless, to understand the rise of political Islam and political culture in Bengal and Bengali Muslim identity, obviously, the flow of the incidents must be discussed through the three major historical events and initiatives during the colonial period (Islam and Islam 2018): *firstly*, the *Fara'idi movement* led by Haji Shari'at Allah in the 1820s (1781–1840); *secondly*, the *Basherkella movement* led by Mir Nisar Ali alias Titu Mir (1782–1831); and *thirdly*, the major initiative led by *Deoband and Bengali Ulema* against the British colony to preserve the Ottoman Empire, historically, which was introduced as the *Khilafat movement* between the late 1910s and early 1920s (1918–1924). These were the primary factual movements for identifying the Bengali Muslim identity, Islam and its vast and deep impacts on the sociopolitical and cultural aspects of Bengal, and current Bangladeshi Muslim society. "The challenges that confront politicians and policymakers, as well as the general public, are mostly due to negative legacies that may have roots in the colonial past" of Bengal and current Bangladesh (Islam 2017a, c). Despite an end to Muslim political rule, seeds of Muslim identity remained buried in Bengal, coming to the fore with the establishment of a Muslim political movement in Dhaka in the early decade of the twentieth century. The movement gradually turned into a movement calling for an independent homeland for Muslims, leading to the formation of Pakistan in 1947. Although designated as a homeland for Muslims, discontentment arose in the eastern part of Pakistan over economic and social policies which were seen to be favoring the western part. East Pakistan became independent from Pakistan after a 9-month bloody war which led to the formation of Bangladesh in 1971.

### Historical Development and Challenges of Political Culture in Bangladesh

After the independence from Pakistan in 1971, Bangladeshi politics has evolved, and the country's politics tend to take regime histories as their point of departure. Historically, several interlocking themes characterize the political culture in the country. Dependence on totalitarianism in times of catastrophe and promise of political differences through extra-parliamentary way are consistently conveyed by appeals to contradictions in nationalist ideology and the representation of political balk as anti-patriotic. Along with the extraordinary partisanship that informs the politico-cultural landscape under all regimes, patronage politics tends to predominate whether governments are elected or military. Ironically, both ordinary citizens and opposition parties often find that the only effectual mode of political engagement open to them is mobilizing on the streets. The most lasting sites of contestation rotate on the question of national uniqueness and the place of religion in defining Bengali/Bangladeshi nationalism and the historically constructed Bengali/Muslim dichotomy. As we shall see, efforts over narration and reminiscence have confidentially formed the construction of political oratory and practice. To put it differently, the setbacks of statecraft and of record script have been profoundly knotted. Highly charged ideological debates about nationalism frequently eclipse conversations on other critical issues, such as distributive justice. Moreover, constant "culture wars" have permitted a deepening division of the political scene; the general upshot is a progressive hollowing out of political philosophy and performance (Siddiqi 2010, p. 8).

### Historical Measurements Towards Promoting Islam and Democracy in Bangladesh

In order to understand the impact and presence of Islam in the Bangladeshi public sphere today, one needs to look at various historical developments towards this effect in post-independent Bangladesh to understand the state's current and future interests (Islam 2020b), because in Bangladesh, different political regimes have implied different roles (Islam 2017a, b, c). In the period between 1975 and 1990, several important measures were taken to introduce and promote Islamic values in Bangladesh, which can be discussed as follows (Hasan 2011, p. 8):

1. Secularism was put forward as one of the four state principles in the 1972 constitution. This was changed by General Zia through the Fifth Amendment in 1979. Among a host of changes, he incorporated "absolute faith and trust in the Almighty Allah" in place of the previous principle of secularism by putting "Bismillahirrahmanir rahim" (In the name of Allah, the Merciful, and the Compassionate) into the Constitution of the People's Republic of Bangladesh. It is mentionable that this change was later annulled by the Fifteenth Amendment adopted by the Bangladeshi government in 2011.
2. Another marker was initiatives for posters in government offices and public places with the quotations from the Holy Quran and sayings of the Prophet Mohammad. Moreover, the display festoons apart from flying national flags for celebrating religious festivals such as Eid and the wishes from public officials highlighted the importance of the administration attached to Islamic teachings.
3. Regular Islamic acts of worship such as the offering of Munajat (prayers) on special occasions and the performance of Namaz (worship ritual) and call of Azan (call to prayer) five times in a day continued without hindrance, unlike countries such as Turkey, where the call to prayer was modified and restricted, or India, where anti-Muslim attitudes and activities sometimes limit the ability of Muslims to freely express their religion.
4. Other administrative measures such as the foundation of a separate division of Religious Affairs led by a minister, the constitution of the Islamic Foundation and the extension of its research facilities, a Zakat (charity) fund, set up of an Islamic university, and the establishment of the Madrasah Board followed by

education policies encouraging Arabic and religious education in primary schools indicate the willingness of the state to promote Islamic values and teachings.

The Fifth Amendment to the Bangladeshi constitution in 1979 led to the re-emergence of Islamist parties such as the Jamaat-e-Islami in the political scenario. Following this, the Eight Amendment Act passed by the Ershad military government in 1988 declared, among others, in article 2A that Islam would be the state religion in Bangladesh. This was seen as a major step towards acknowledging the efforts of Islamization under the Ershad regime. Up until today, there were seven Islamic political parties registered in the Election Commission in Bangladesh, including Bangladesh Jamaat-e-Islami (BJI), Zaker Party, Khilafat Andolon, Muslim League, Jamiat Ulema-e-Islam Bangladesh, Islamic Front Bangladesh, and Islamic Oikko Jot (IOJ). At the zenith of their political presence, BJI and IOJ achieved several parliamentary seats among these seven parties in the 2001 general election. The BJI and IOJ assisted the BNP informing the central government during this time, and two ministerial portfolios were given to BJI candidates in the BNP-led government which lasted until 2006.

## Characteristics of Political Culture in Bangladeshi State from Socialism to Neo-liberalism

The political culture of Bangladesh underwent significant changes since its inception in 1971. The four guiding principles of the state adopted by the 1972 constitution included nationalism, democracy, secularism, and socialism (Riaz 1994, p. 116). Not only were these principles shaped by sociopolitical contexts of the time, but they were also conditioned by Sheikh Mujibur Rahman and Awami League's understanding of them. It is important to note that secularism as pertaining to the Bengali word *dhormoniro-pekkhota* is a form of commitment to non-communalism rather than separation of the functions of the state and the religious establishment as connoted in Western notions of the secular and *laicite*. Moreover, socialism was seen as freedom from exploitation rather than a function of communism, as expressed by Mujib himself in his memoirs (Rahman 2012, p. 237). However, despite such lofty ideals, less than 3 years into his rule, Sheikh Mujibur Rahman (1972–1975) pushed through the Fourth Amendment to the constitution, which replaced parliamentary democracy with a one-party rule.

The government of General Ziaur Rahman (1975–1981), which came in the aftermath of the assassination of Sheikh Mujibur Rahman, enacted the Fifth Amendment to the Bangladeshi constitution in 1979. The amendment brought about major changes such as the abandonment of socialist ideology and secularism of the BAKSAL era. The reinstatement of multiparty politics meant that Islamist parties such as Jamaat-e-Islami got the prospect to enter in Bangladesh political system. Moreover, the Bangladesh Nationalist Party (BNP) founded by Major Zia in 1978 embraced an explicit Muslim Bangladeshi identity different from the avowedly secular nature of Bengali identity promoted by the Awami League.

Following the assassination of Zia, his successor General Ershad usurped power and limited the expression of democracy throughout the length of his 9-year dictatorial regime. Through what many consider a popular move, Ershad further undermined the secular roots of Bangladesh by declaring Islam as the state religion through the Eighth Amendment. Alongside their attempts at strengthening the non-secular face of Bangladesh, both Zia and Ershad also challenged the earlier socialist policies of Sheikh Mujibur Rahman. Coupled with state-led initiatives for growth such as major investments in communications and infrastructure, their economic policies were large of a neoliberal nature. They worked towards withdrawing state subsidies and promoting a regime of trade liberalization and export promotion (Siddiqi 2010).

## Islam in the Political Sphere: Convergence and Contradiction

The contemporary presence of Islam and discourse surrounding Islam in the Bangladeshi

political sphere is an area with multiple points of convergence and contradiction. In the aftermath of the events at Shahbag in 2013, the rise of the Hefazat-e-Islam (HI), a movement of Islamic scholars and students from the thousands of madrasahs or religious seminaries in Bangladesh, has changed the discourse on how Islam is perceived in the political sphere. Originally an apolitical faction of scholars led by Allama Shafi, the HI came to the fore in 2013 with very political demands of punishment of atheist bloggers and the implementation of laws to punish blasphemy against the Prophet Mohammad or Islamic teachings. (See 13 point demand of Hefazote Islam (2013). Available at https://www.bbc.com/news/world-asia-22424708.) The movement blended into a general call for the downfall of the Awami League government on the basis that it was against Islamic sentiments of the general populace, a development which aligned with the goal of the opposition BNP and BJI. Although the movement was suppressed by force, it ultimately changed conversations around Islam in the political sphere in Bangladesh.

The Fifteenth Amendment to the constitution under the Awami League government is a classic example of contradiction and convergence surrounding discussions on Islam in the country. While it reverted the constitution to the 1972 founding principles of secularism, nationalism, socialism, and democracy, it still retains the caption of "Bismillahirrahmanir rahim" and the declaration that Islam is the religion of the state. As a result, while the current constitution professes may display contradictory affinity to both secularism and religion, the point of convergence lies in the acknowledgment of Islam as the religion of the majority of the people (Bhuiyan 2017). In addition to the above stance by the Awami League, it also has made alliances with six faith-based registered political parties including the HI, a major portion of which is currently allied with the Awami League. While such alliances converge on the point of Islam and Muslim identity, they are markedly unique in the sense that they oppose "militarism" and "terrorism" in the name of Islam and support Awami League's role in the war of independence.

The opposition, consisting of BNP and the BJI, also argues for a strong role of Islam in the political process but from the perspective of a need to protect democratic ideals and increase the accountability of the state towards its citizens. As such, although there seems to be a convergence in the BNP-BJI and AL-led blocs in their emphasis on the place of Islam and Islamic identity, the difference lies in the professed political culture of the two blocs, whether pro-democratic or pro-authoritarian. Thus, despite their convergence on Islam, the secular Awami League-led bloc has an authoritarian political culture, while the pro-Islam political bloc of the BNP-BJI has a democratic political culture (Fair and Patel 2020, p. 2).

## Conclusion

In every context, to find out relations is the best way to arrive at an unparalleled solution (Islam 2020a). Previous studies on the relations between Islam, governance, and political culture in Bangladesh relate and influence each other predominantly focusing on established theory. The nature of such relations in the case of nexus between Islam, historical governance, and political culture of Bangladesh has often been ignored. Yet the interaction between these entities is increasingly becoming an important aspect in understanding why Islam has a profound impact on the political culture of Bangladesh. Similarly, the link between Islam, governance, and political culture in Bangladesh helps us in putting emphasis on political and sociocultural trends in the country, and understanding how this shapes and impacts Bangladeshi Muslim identity. While the study has given a general analysis, it provides a basis for future research on comparative studies between secular identify and Bengali Muslim or national identity, how Islam played a peaceful impression on the political culture and "political strategy" (Islam 2019) of Bangladesh, why Islam might be the best option and central point for the political crisis in Bangladesh, and how Islam, as a "complete code of life", may help the current political parties of Bangladesh to develop its

unique model that can "ensure the people's rights, freedom, sovereignty, participation, equality, and social justice" (Islam et al. 2020).

# Islamic Governance

Md. Rafiqul Islam
Department of Peace and Conflict Studies, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Islamic administration; Islamic government; Islamic jurisdiction; Islamic management; Islamic rule

## Definition

Islamic governance can be defined as Islamic systems for governing Islamic countries and managing individuals and organizations within those Islamic countries in light of the fundamental principles of Islam. Islamic governance can also be defined as a system of administration, management, rule, or government based on the basic tenets of Islam.

## Introduction

From the perspective of modern Islamic movements, Islam is called "din wa dawla," which combines both "religion and state." Many Muslim and non-Muslim scholars believe that Islam is a comprehensive way of life (Esposito and Voll 1996; Goldschmidt 1988; Haneef 1982) that encompasses the social, cultural, political, economic, and religious spheres of Muslim Ummah. Although the concept of governance has gained popularity in modern times, it is as old as human civilization. Governance as a concept has existed as long as human organization has existed. Indeed, governance and government are often used interchangeably (Kjaer 2004). Islamic governance is system governance exercised in light of the basic principles of Islam. The glory of Islamic governance reached its zenith during the rule of Prophet Muhammad and pious caliphs. However, most of the Muslim countries of the modern time are lacking the basic characteristics/principles of Islamic governance.

This entry is divided into two main sections. The first section of the entry begins with a brief discussion on the conceptual meaning of governance, followed by an analysis of the key features of governance. The final section of the entry provides a brief discussion on the conceptual meaning of Islamic governance and a historical background of the system of governance in Islam, followed by a brief analysis of the key features of Islamic governance.

## Conceptual Meaning of Governance

The word "governance" is an amorphous concept which purports different meanings to different people. According to *Cambridge Advanced Learner's Dictionary*, governance is defined as "the way that organizations or countries are managed at the highest level." Governance entails the systems for managing the organizations and countries at highest level with an aim to promote and maintain the highest standards. The Oxford English dictionary defines governance as the action and manner of governing. According to Merriam Webster Dictionary, governance is interchangeably used as administration, authority, rule, government, jurisdiction, regime, domination, direction, management, regulation, and so on. The *Webster's Encyclopedic Unabridged Dictionary of English Language* defines governance as a method or system of government or management. As a value-laden normative concept, governance can be defined as "how well governments govern or serve the people" (Maheshwari 2007).

According to the World Bank Group, "Governance is defined as the rule of the rulers, typically within a given set of rules. Governance is also viewed as a process by which authority is conferred on rulers, by which they make the rules and by which those rules are enforced and modified. The understanding of governance signals an identification of both the rulers and the rules, as well and the numerous processed they are selected, defined, and linked together with the society in general (World Bank 2013).

There are divergent views on governance. Governance is sometimes viewed as a narrowly defined phenomenon in the form of activities of only the executive branch of the state, although it is broadly defined as the functions or activities of all the three branches of the state or government, such as the executive, legislative, and judicial branches. The concept of governance also entails the undertaking of activities, management of resources, organization of men and women by groups of people, communities, local government bodies, business organizations, and the government organs through social, political, administrative, and economic arrangements that fulfill the daily needs of people (Hye 2000). Governance is envisioned as an aggregate of numerous ways individuals and institutions, both public and private, manage their common affairs. Governance is an ongoing process through which conflicting or diverse interests are accommodated or cooperative actions are taken. Governance also involves formal institutions and regimes with the authority or power to enforce compliance, as well as informal arrangements that people and institutions either agree or believe to be in their interests (Lyon 2000). According to the Institute of Governance, "Governance determines who has power, who makes decisions, how other players make their voice heard and how account is rendered."

Kaufmann et al. (1999) define governance as "the traditions and institutions by which authority in a country is exercised." The World Bank's PRSP Handbook has defined governance as the way "power is exercised through a country's economic, political and social institutions" (World Bank 2013). According to the United Nations Development Programme (UNDP), "Governance is defined as the exercise of economic, political and administrative authority to manage a country's affairs at all levels. It includes mechanisms, processes and institutions through which citizens and groups articulate their interests, exercise their legal rights, meet their obligations, and mediate their differences" (UNDP 1997).

## Features of Governance

Different scholars have identified different aspects, dimensions, or features of governance. Kaufmann et al. (1999) have viewed graft, rule of law, and government effectiveness as three main aspects or components of governance. Other important features of governance identified by Kaufmann et al. (1999) are voice and accountability, political instability and violence, and regulatory burden. Aras and Crowther (2009) have identified eight principles/indicators or features of governance. These features of governance include transparency, rule of law, participation,

responsiveness, equity, efficiency and effectiveness, sustainability, and accountability. Many scholars view most of these components of governance as the common features of sound or good governance. However, the common features of governance are briefly discussed as follows.

### Transparency

The dictionary meaning of transparency is the quality or state of being transparent. Transparent means something clear or obvious that can be easily seen, detected, or readily understood. As a key feature or indicator of governance, transparency requires that information is freely available and directly accessible to those people who are affected by both decision-making and its implementation or enforcement (Aras and Crowther 2009). In legal terms, transparency means that information on matters of public concern is made open to the citizens or those who will be directly affected by the making or execution of the decisions. It also means that transactions involving public interests must be fully disclosed and made accessible to the public. Again, if the making of decisions and its enforcement are based on rules and regulations, the system of governance will be transparent. If not, then the system of governance will be unsound and/or corrupt.

### Rule of Law

As an important feature or indicator of governance, rule of law requires that government acts within the limits of powers and functions set by the laws of the nation. Democratic governance or good governance requires that those who govern must follow the rule of law and will not act arbitrarily or at will. Absence of rule of law brings about disorder and anarchy that help increase corruption, because rule of law promotes peace, order, and justice and reduces disorder, anarchy, or corruption.

### Participation

The type or nature of governance is envisioned in terms of the degree of participation. Participation connotes active involvement of all the stakeholders in the decision-making process who affect or are affected by decision. Participation embraces the involvement of everyone, especially all adults, including males and females. Based on the size or structure of the organization, participation can range from direct to indirect, especially through intermediate institutions or representatives (Aras and Crowther 2009).

### Responsiveness

Responsiveness means answerability or the state or quality of being quick to react properly or sympathetically. Responsiveness implies that governance regulations enable institutions and processes of governance within a reasonable time frame. In democratic governance, responsiveness means that actors and structures of organizations easily provide actual expression to the will and desire of the people. In actuality, the interests of all the people need to be well protected in a prompt and proper manner.

### Equity and Justice

The principle of equity purports that all members of the society, especially the minorities, most vulnerable, or the people at the grassroot levels, must be taken into account in the decision-making process. The equity principle of governance implies that no one will be discriminated because of his/her race, ethnicity, color, religion, gender, nationality, and so on. The equity principle requires the mechanisms to make sure that all stakeholder groups will have the opportunity to maintain or promote their well-beings or improve their overall socioeconomic, political, and cultural conditions. Social equity is also thought to be a kind of justice that provides more opportunities to the underprivileged people. Therefore, establishing social justice cannot be expected without promoting the norms of equity in the society.

### Efficiency and Effectiveness

The words “efficiency” and “effectiveness” are often used interchangeably. Etymologically, efficiency means the quality or state of being

efficient, while effectiveness implies capability of producing result or outcome. Efficiency can be defined as the capacity or capability of minimization of transaction cost, while effectiveness is explained in terms of achievement of desired goals. Making the best use of resources, organizational effectiveness can be ensured by producing results through the processes and institutions (Aras and Crowther 2009). Indeed, the principle of efficiency and effectiveness requires the improvement and standardization of the quality of service delivery. Efficient and effective governance requires the increase of capacities and elimination of redundancies or overlaps in functions and operations.

### Sustainability

The principle of sustainability emphasizes a long-term perspective for sustainable human development and the process of attaining the goals of such development. Sustainability can be explained from different perspectives. Broadly speaking, sustainability is concerned with the effect which action taken in the present has upon the options available in the future. Sustainability means that society must use no more of a resource than can be reproduced (Aras and Crowther 2009).

### Accountability

Accountability implies the state or quality of being accountable. Accountability involves an obligation or willingness to accept responsibility or to account for one's actions. Accountability is based on the principle that every person or group is responsible for his/its actions if those actions are illegitimate/wrong or if those actions hamper public interests. The accountability principle of governance holds that those who are involved in the process of governance have the responsibilities or obligations to explain or answer for the consequences of their decisions on behalf of their communities they serve. Based on the nature of governance, accountability can be of different types: political, social, administrative and/or managerial, hierarchical, and so on. In democratic governance, it is more convenient to ensure accountability, while in autocratic or dictatorial form of governance, it is difficult to ensure accountability.

## Meaning of Islamic Governance

Given the aforementioned discussion, Islamic governance refers to Islamic systems for governing Islamic countries and managing organizations within those Islamic countries in light of the fundamental principles of Islam. Islamic governance is a system of administration, management, rule, or government in accordance with the basic tenets of Islam. Islamic governance involves the rule by the Muslim rulers who follow the principles of Islamic laws or Shariah in ruling the Islamic states. Islamic governance also embraces the performance of activities, management of men and resources, and organization of people or Muslim Ummah by Islamic communities, business organizations, and numerous governmental departments in accordance with Islamic laws and/or principles.

In short, governance in Islam encompasses the processes and functions through which the governments or regimes as well as the formal institutions of Muslim countries are empowered to make decisions or enforce compliance in light of Islamic laws, values, norms, or principles as mentioned in Quran and Sunnah. Islamic governance also embraces Islamic traditions and institution through which authority in an Islamic country is exercised. Islamic system of governance lays the foundation of functional or operational framework within which Muslim organizations are expected to function. Islamic system of governance provides the guiding principles that necessitate the accomplishment of the objectives of Shariah. The Madinian Polity is the best example of Islamic governance that emphasized the universal principles of justice, equity, compassion, and other qualities or attributes of high civilization (Aziz 2017).

## Pre-Islamic System of Governance

Before the Islamic rule by Prophet Muhammad and the pious Caliphs, two different types of governance or administration prevailed in the ancient Arab world, such as the governance or administration of the town people and the governance/administration of the desert people as the ancient Arabs were divided into two main categories, the town people (the Ahl al-Hadarah) and the desert dwellers (Ahl Badiyah). The city administration during the pre-Islamic period was run by a Council of Elders called al-Mala. To transact business, the leading citizens gathered in a hall called Daru'n Nadwash, and the general meeting of the citizens (nadin qawn) took place in the court of the Ka'bah. The functions relating to the city in general and the Ka'bah in particular were vested upon the powerful Makkan families as the Quraysh were in charge of the Ka'bah (Imamuddin 1984).

The governance system of the desert people was different from the city/town government in that there was no proper administrative machinery and no officials or offices but there was a ruler in each clan or tribe who was called al-Shaykh or the Elder. The Arab chief or al-Shaykh represented the united will of the tribe both in war and peace. The Shaykh did not have any executive power as the tribe did not have any criminal law. Nobility of birth, seniority of age, and personal qualities were the key indicators for determining the position of the tribal chief in the Arab society. The tenure of office of the tribe chief relied upon the good will of the members of his constituency (Al-Baladhury 1916; Imamuddin 1984).

Being democratic in spirit, the Arabs were unwilling to submit to the arbitrary rule of the Shaykh. For this reason, the chief had to make his decisions in al-Mali (a Council of Elders in a town) which represented the clans and sub-clans. Every clan was responsible for the conduct of the clan members. Maintenance of peace within the tribe was the main responsibility of the Shaykh who was assisted by the Council of Elders. In judicial, military, and other matters of common concern, the tribal chief or Shaykh needed to consult with the tribal council represented by the heads of component families (Imamuddin 1984; Al-Mubarad 1864).

## The Golden Era of Islamic Governance

The systems of governance under Prophet Muhammad (SM) and the pious Caliphs were the golden times of Islamic governance. Under the governance of Prophet Muhammad (SM), Islam took precedence over tribal loyalties and created such an ideal society that was governed by codified ordinances. The Islamic governance of Prophet Muhammad (SM) brought about a significant change in the society by introducing civil laws affecting individuals and/or existing system of inheritance. Islam focused on removing the abuses that came out in the change from a communal system of ownership to an individualistic one. The Islamic system of governance for maintaining security of life and property of people was highly effective and commendable. While usury was forbidden, profit-making from trade was encouraged under the governance of Prophet Muhammad (SM). Again, payment of zakat by the rich to the poor helped maintain economic and social equilibrium (Imamuddin 1984).

The Prophet established a strong bond of brotherhood between the people of different tribes, clans, or communal groups. The Charter of Madinah was an excellent example for establishment of friendly relations among people of different tribes and/or communal groups. Various Jewish clans were mingled with the Muslims under the leadership of Prophet Muhammad (SM) into a community (Ummah). Of various aspects, guarantee of peace and protection of life, property, sanctity of women, and liberty were included in the Charter of Madinah. The Prophet presented Arabia a centralized form of government that concentrated a good deal of power in its hands retaining many of its ancient laws, institutions, and customs that did not contradict with the divine laws. The authority of the Prophet was supreme in executing the injunctions of the Qur'an and in matters on which there was no indication in the Holy Book (Imamuddin 1984).

The systems of governance under the pious Caliphs of Islam, such as Hazrat Abu Bakr, Hazrat Umar, Hazrat Uthman, and Hazrat Ali, respectively, were the best examples of golden periods of Islamic governance after the administration of Prophet Muhammad (SM). According to Arnold (1967), "there was certainly some form of election in the case of Abu Bakr, 'Umar, 'Uthman and 'Ali and that there was no consideration of relationship in the choice of a caliph. The pious caliphs were addressed either by any one of the three titles Khalifah, Amiru'l Mu'minin, or Imam" (Imamuddin 1984).

Besides Islamic governance under Prophet Muhammad, there were numerous examples of good governance during the golden era of Islamic governance. For instance, during the Islamic rule (Khilāfat) of Caliph Abu Bakr, the establishment of peace within Arabia through introduction of social and political institutions was commendable. Moreover, Caliph Umar founded an ideal government and proper administration. Umar believed in giving right to all to demand and protect their rights and express their views openly, to limit the rights of the ruler, and to criticize his action. Umar himself emphasized the rights and duties of the caliph and the subjects. To him, the caliph had his share in the wealth of the subjects as the guardian had in that of the orphans. If he was affluent, he should take nothing from it, and if he was poor, he should take according to his needs (Yusuf 1302 H; Imamuddin 1984). Umar also introduced democratic methods in the appointment of tax collectors. Indeed, Umar's Khilafat was similar to the republican form of government. This is because all matters relating to the country and the nation were discussed in the Majlis al-Shura and resolutions were made accordingly (Al-Mawardy 2005; Imamuddin 1984).

## Key Features of Islamic Governance

There are different aspects and/or features of Islamic governance. However, the main features or principles of Islamic governance are briefly discussed as follows:

### The Khilafah

The system of governance in Islam is the Khilafah or Caliphate. The system of Islamic governance is deep-rooted both in the Islamic Shari'ah and the history of Islam (Mujahid 2012). Although the terms "Khilafat" and "Caliphate" have derived from Khalifa (caliph) and often used interchangeably, they have different meanings. Khilafat refers to the Islamic institution of spiritual successorship, while Caliphate involves a politico-religious Muslim state governed by a caliph or Khalifa. Khalifa means successor. Abu Bakr, the first caliph in Islam, was given the title of Khalifa or Deputy of the Prophet, and his election as the Khalifa signaled the introduction of the great historic institution of the Caliphate (Lewis 1993). The Khalifa is the guardian of the people, and his responsibility is to make sure that Shari'ah is implemented to establish justice.

Under the Khilafah, there is no separate legislature since the power of legislation emanates not from man but from the creator of man. It is the Khalifah who implements the Shari'ah in the lands of Islam (Mujahid 2012). Al-Mawardi holds that the institution of the Caliphate or Imamate is an essential requirement of the Shariah. The Imamate is instituted by means of election by electors who are qualified. The candidates must possess certain qualifications, such as Adālah (justice), Ilm (knowledge of traditions), sound physical and mental conditions, courage and determination to protect the territory of Islam, and descendant of the Quraysh. According to imam al-Mawardy (2005), Imamate is prescribed to succeed prophethood as a means of protecting the deen (Islam) and of managing the affairs of this world (Al-Mawardy 2005).

### The Rule of Law

In Islamic governance, As-shura or the rule of law is established on the basis of Shari'ah. Shari'ah means the laws of the Almighty Allah. The Shari'ah was revealed through the ordinances of Qur'an and exemplified in the Sunnah (way of life) of the Prophet himself. Certain ordinances are obligatory and it is sin to violate them (Hussain 1984). The Caliph/Khalifah is

responsible for implementing the Shari'ah in the lands of Islamic states. Not only the common people, the Khalifa, his governors, administrators, and the kadis (judges) are also obligated to abide by the rule of laws in Islam (Mujahid 2012).

As-shura or the rule of law is one of the most important constitutional principles in Islamic law. According to Welton, "The Islamic world, too, has a devotion to the rule of law that has prevailed through much of its history and, while severely impaired in the nineteenth and twentieth centuries by Western colonialism and its aftermath, has resurfaced as a desired virtue, fully compatible with Islamic law and tradition" (Welton 2007, p. 173). While in modern democracies the state ensures people's obedience to the law of the nation through coercion, Muslims historically lived by and obeyed the laws of Islam by large without the need for coercion (Mujahid 2012).

### Transparency

Transparency is a key feature of Islamic governance in that both the ruler and the ruled respect the rule of law. Any political or administrative action under Islamic rule is open to public and nothing is hidden to them. Islamic governance is always against illegal, immoral, and corrupt activity. In Islam, people have the right to know how public money is spent. In this respect, Caliph Umar had rightly stated that the subjects had the right to know that the money from the treasury was spent in an appropriate manner, to demand the increase of daily rations, to guard the frontiers, and to protect them from danger (Yusuf 1302 H; Imamuddin 1984). Islamic governance always encourages the elimination of corruption and promotion of the duties and responsibilities in the conduct of government business.

### Equity and Justice

Islamic system of governance emphasizes equity and justice. In Islam, people are equal in rights, responsibilities, and public duties. It is also mentioned in the Qur'an and Sunnah that no individual will be discriminated because of his or her race, origin of birth, nationality, or belief. In the eyes of Allah, all people are equal irrespective of their race, color, origin, or nationality, the only difference is that of righteousness (Qur'an, Al-Hujrat, 49: 13).

Justice in Islamic governance is regarded as one of the highest virtues. In Islam, justice means putting things in their right place. Justice is ensured by giving everybody equal treatment. In Islam, justice is an honest and noble quality of human beings. Justice in Islamic governance implies that government will do the best in all possible ways to fulfill the needs of the people of the country. In Holy Qur'an, Allah (God) commands justice and fair dealing (Qur'an, Al-Nahal, 16: 90). Prophet Muhammad was ordained by Allah to establish justice among the people (Qur'an, Al-Hadeed, 57: 25).

### Accountability and Responsiveness

Islamic governance ensures the accountability of both the rulers and the ruled. The Khalifah/Caliph, his administration, and the judiciary are accountable to the people, and there is no room for the rulers to deviate from the rule of the laws. In Islamic governance, there is a strong judiciary that implements the laws of Islam, dispenses justice, and holds the executive accountable. Under Islamic rule, the judiciary is responsible for holding the state officials, including the Khalifah and his governors accountable, for wrongdoing (Al-Mawardy 2005, p. 121; Mujahid 2012). The judiciary or kadis has the authority to investigate the abuse of power by rulers against the ruled and to hold them accountable for the injustice they may have done. For instance, Khalifah Umar bin Abdul Aziz (RA) introduced formal procedures to investigate the wrongdoing by officials and punish the wrongdoers (Al-Mawardy 2005, p. 118; Mujahid 2012).

### Efficiency and Effectiveness

Islamic governance is very much consistent with the efficiency and effectiveness principle of good governance. In Islam, the most qualified and efficient persons are believed to govern the Islamic states. Indeed, Prophet Muhammad, the pious caliphs, and many successful Muslim rulers were highly skilled and efficient in the art of governing the states.

### Acknowledging Virtues and Forbidding from Sin

Islamic governance aims at protecting acknowledged virtues and forbidding people from committing sin. Islam preaches for doing good or virtuous activities (amr-bil-maruf) and forbidding from sin (nahi anil munkar). "Amr-bil-maruf wanahy an al-maruf" means ordering good or acknowledged virtue and forbidding evil or sin. Islamic governance respects for acknowledged virtues and takes preventive measures from committing evil or sin. Ordering acknowledged virtue and forbidding sin are essential Islamic duties believed by all the members of Muslin community. Islamic governance seeks to make sure that people should support al-maruf (virtuous/good deeds) and oppose al-munkar (sin). According to Quran, God says that there should be a group among people who invite toward good, order for acknowledged virtues, and forbid from sin, and they are successful ones (Quran, Al-Imran, 3:104).

## Conclusion

In short, Islamic governance is a system of administration, management, or rule by the government in light of fundamental principles of Islam. Islamic governance embraces the rule by the Muslim rulers based on the maxims of Islamic laws or Shariah. Islamic governance involves the processes and functions through which the governments or regimes and other institutions are entitled to make decisions or enforce compliances in accordance with Islamic laws, values, norms, or principles.

It seems axiomatic that Islamic governance does not confront with the key principles or characteristics of good governance because most of the basic principles/characteristics of good/sound governance are also found in Islamic governance. For instance, rule of law, transparency, accountability, responsiveness, equity and justice, efficiency, and effectiveness are the common principles or characteristics of both Islamic governance and good governance. Islamic governance is also consistent with the sustainability principle of good governance in that it promotes sustainable human development. However, the main difference between Islamic governance and good governance in terms of the rule of law is that in Islamic governance rule of law is established based on Quran and Sunnah, while in good or democratic governance, laws are mainly made by the legislators or people's representatives in the parliament.

## Islamic Public Administration

Hassan Danaeefard[1] and Morteza Javanali Azar[2]
[1]Faculty of Management and Economics, Tarbiat Modares University, Tehran, Iran
[2]Faculty of Islamic knowledge and Management, Imam Sadegh University, Tehran, Iran

### Synonyms

Islamic management

### Definition

The process of planning, organizing, leading, and controlling resources to achieve the material and spiritual goals of managers and employees based on Islamic paradigm and values.

### Introduction

Although there is no comprehensive framework, theory, or model for the IPA study, scholars of Islamic states are trying to achieve this purpose (Danaeefard 2015). In recent years, not only in Iran but also in other Islamic countries and even in the international forums of public administration, the demand and effort to build these frameworks, theories, and models have enhanced. Many scholars have sought to elicit and theorizing various administrative implications from religious sources. Numerous works on Islamic management (and not just IPA) have been published. The fundamental approaches of those works can be classified as follows: (1) holy excellence approach in Islamic management, (2) ethics approach and characteristics of Islamic managers, (3) approach to the duties of Muslim managers, and (4) the approach of Islamic values in management (Chavoshi 2010).

Although these approaches have played a role in developing management knowledge, the outcomes of these approaches have been some implication or guidelines for promoting IPA's religious foundations and not the production of empirical knowledge for IPA. But in this essay, a framework for the study of IPA is presented. This framework that consists of several components reminds theorists, thinkers, and scholars of IPA what implications should be considered for the production of theories and models of IPA and how to combine these elements in the light of Islamic values, since there must be a kind of "theoretical or observational framework for the study of the field" initially in any scientific field. Thus, one must first determine the conceptual framework or guide that shows the phenomenon under study and then theorize about the components and their connection. Accordingly, the theorist has tried to provide a framework for researchers to keep in mind the big picture of IPA when researching it. This entry provides the general framework needed to study IPA.

Therefore, in the first section, we reflect on the connection between religion and administration and then identify the IPA and the IPA framework guidelines' normative theoretical foundations and finally build the IPA study framework. The author claims that scholars can fill this framework with appropriate theories and models and their rational, narrative, and experimental study elements. Islamic scholars can avoid conducting fragmented theoretical works by considering this framework. We can compare this framework with Mendeleev's basic chemistry table, filled with various research findings over time. The author introduces the following definition for IPA: *the*

*process of planning, organizing, leading, and controlling resources to achieve the material and spiritual goals of managers and employees based on Islamic paradigms and values (especially social justice).* In general, the author believes that any researcher who wants to theorize about IPA should consider the combination of the following elements: Muslim paradigm beliefs, management process (planning, organizing, leadership, and control), goals of IPA, the international environment, and the values that shape both the management process and the purposes of public administration.

## A Reflection on the Studies of "Islamic Religion and Administration"

In the positivist paradigm, scientists assumed the essence of phenomena, whether physical or social, is stable. They imagined scholars' mission to discover the cause-and-effect relationships governing these phenomena. The emergence of various philosophical paradigms (Danaeefard 2012) and the confirmation of the context-oriented form and content of social and human sciences by interpretivist and meta-theoretical studies (Tsoukas and Knudsen 2004) have influenced the reflection on the relationship between religion and IPA. Since then, religion has also been considered an influential moderating variable in social science theorizing practice. This practice has also become common in the field of management and public administration. Accordingly, Shah et al. (2007), by studying the existing knowledge about the relationship between "religion and public administration," has classified all research works in this field into three general categories:

1. Works that equate religion with a set of values that have indirectly examined the relationship between religious faith and public administration.
2. Works that have imagined religion as a cultural element or part of the context governing the management of development and reform of the public sector.
3. Works that directly deal with the connection between religion and public administration both from a comparative religious perspective and from a single religious tradition.

Although most of these works have been done in developed countries, few works have been done in Islamic countries.

## Islam and IPA

The evolution of Islamic administration studies shows that there is no book entitled IPA. However, terms such as Islamic administrative system and Islamic management have been used extensively. But in international works, there are titles close to it, for example, *Values and the Influence of Religion in Public Administration* (Sunder 2011), *Administrative Development: An Islamic Perspective* (Al-Buraey 1985), and *A Treatise on the Islamic Approach to Public Administration and Management* (Khan 2013). Several useful works have been published in reputable quarterly journals, one of the most important papers published by the Kalantri (1998) as *In Search of a Public Administration Paradigm: Is There Anything to Be Earned from IPA*? There are no works on IPA in Iran, although a bibliography on Islamic management in Iran has been provided by Abedi Jafari and Sangi (2008).

Shah et al. (2007) claim in their study that the link between Islam and public administration has accounted for a large volume (compared to other religions) of research work. According to these researchers, a significant part of this knowledge is normative (ideology) and focuses on how the "values and principles" of Islam should influence or affect the actions and speeches of public officials.

## Islamic Public Administration

Meta-theoretical studies (Tsoukas and Knudsen 2004) have played an influential role in justifying indigenous and, notably, Islamic knowledge in different countries. Suppose we accept that science is context-oriented and that each country's

political, economic, social, cultural, and technological conditions affect the form and essence of productive knowledge. In that case, we can accept that indigenousness in Islamic countries is adherence to Islam, not the geographical territory. Although there are differences in the type of perceptions and views toward Islam in Islamic countries, there are many stable elements and original foundations in Islam's case. Because religion influences Muslims' thoughts, behavior, and speech (to varying degrees), the behavior that emerges from them may reflect some of religion's manifestations. If the goal is to produce empirical knowledge, such knowledge can be produced by creating knowledge through Islamic subjects and objects. Before making empirical knowledge, religious experts (relying on the primary sources of religion), by producing normative religious knowledge, try to instill the spirit of religion in human beings so that the behavior, intentions, attitudes, etc., of Muslims take on a divine-religious character.

Therefore, we can justify both normative and empirical knowledge of IPA in the light of meta-theoretical studies. Numerous normative studies on the role of religion in various dimensions of society have been conducted. Accordingly, the present age is not the age of confrontation with the justification of IPA because this change has occurred, and extensive knowledge has been produced about it. Does the IPA have strong intellectual foundations?

## Fundamentals of IPA

All public administration movements in the public sector were based on a variety of theoretical foundations. For example, new public management (NPM) is rooted in the theory of public choice and managerialism. The new public service (NPS) movement bases its theoretical foundations on (1) theories of democratic citizenship, (2) organizational humanism, (3) new public administration (NPA), and (4) postmodernism. The public value management (PVM), NPA, and the administrative management (AM) movement also have their theoretical foundations.

The IPA movement also has principles whose sources are:

1. The Qur'an
2. Islamic sources
3. The manners and traditions of the prophets and Imams
4. The theories of religious scholars
5. The experience of the predecessors and early scholars of Islamic civilization

In the meantime, the holy books (especially the Qur'an) are one of the primary sources of guidance by explaining the rights and duties of human beings. Prophets have also been sent as prophets to express and explain the holy books. The sacred texts, although numerous and seem different, are complementary to each other, and the Qur'an is the most complete and supreme divine books. The Qur'an also considers the books of other religions to be the guide of human beings. The Qur'an is a guidebook for personal life, group, managerial, and governmental officials. Accordingly, the Qur'an has direct and indirect guidelines that can be considered as the primary basis and foundation of the IPA movement.

Accordingly, the Qur'an is the most source for eliciting the implications governing the framework of IPA. Besides, the hadiths and statements of the prophets, Imams, and Saints of God and the manners and traditions of the prophets and Imams and Saints of God are other sources of eliciting the guiding guidelines of the Islamic administrative system. The following guidelines and commands can be the basis for the establishment of IPA (Danaeefard 2015):

1. God considers human beings as His servants.
2. The public interest is not determined only by the people (or the majority of them). It is the command of God, His Messenger, the Imams, and, finally, the society's guardian who recognizes it.
3. The Islamic state should be the basis for the growth of the people.
4. All people have a role in the realization of the Islamic state.
5. Learning from others with the intention of improvement is a good thing.

6. The actions and deeds of the Islamic government's managers and employees are more effective in accompanying the people than their words and sayings.
7. Public administration must be sensitive to the dignity of God's servants.
8. The administrative system should dedicate itself to the servants of God rather than thinking about giving orders.
9. Protecting people's rights is very precise and challenging.
10. The Islamic government is in charge of fulfilling (not just propagating and expressing) the divine commands.

## Guidelines (Key Principles) Governing IPA

Danaeefard (2014, 2015), by studying Islamic texts, has enumerated the following principles as the governing principles for the Islamic state management movement:

1. **Those who receive services from public organizations are servants of God; public servants must serve the servants of God and do not think of them as customers, consumers, clients, or citizens**.

   In the Islamic state, all human beings are servants of God; they are all creatures of God. Rulers, politicians, policymakers, managers, and employees of the Islamic government should consider those who refer to themselves, their organization, and their workplace as servants of God. There is a direct relationship between the satisfaction of the people and the satisfaction of God. Therefore, in the IPA movement, this guideline is different from the values governing the AM, NPA, NPM, NPS, and the PVM.
2. **Pursue a kind of public interest that grows the servants of God.**

   In the most general and at the same time the most comprehensive definition of public administration, "public administration can be thought of as the management of the public interest." In other words, all members of society seek their interests individually and manage their private space in a way that benefits them the most. But public administration is responsible for managing the public area of society. Thus, governments' efforts to improve the management of public space may threaten individuals' interests. With this description, there are several theoretical and conceptual disputes over what is in the public interest. Some claim that the public interest (public interest) in the Islamic government is not determined solely by government officials, policymakers, public managers, and the people. The essence and basis of public interest are determined by religion in the light of revelation. In general, Islam's public interest is considered to be the interest that develops human beings toward the perfection from which the purpose of God's creation is mentioned.

   Therefore, in light of religious sources (revelation, tradition, reason, and jurisprudence), Islamic states and governments try to draw a kind of public interest that will help society's growth and each individual in society.
3. **To play the collective role of God's servants in realizing the Islamic government, place more value on individual entrepreneurship in the public sector.**

   Although the leader has divine legitimacy in the Islamic government and the people, it has no role in this legitimacy principle. Still, without the people, the leader will not succeed in implementing the divine rules. Therefore, the role of the people in the Islamic government has been emphasized a lot. Accordingly, the people's presence in the economic, social, cultural, and political arenas is a good thing. The close connection of the people with the government is considered the secret of the Islamic government's survival and continuity.

   In IPA, this presence should be valued by relying on appropriate mechanisms. Paying attention to the people aware of religion's philosophy, holy prophets, and Imams and their participation in realizing the growing public interest has a more critical role than entrepreneurship in the public sector. In other words, achieving efficiency is essential. Still, the

presence and respect of the people as Islamic citizens in Islamic society is more important, even if it sometimes entails material costs.

Suppose all public policies, programs, and projects are formulated based on divine commands and the people's cooperation. In that case, there is no doubt that the government's collaboration and the people will meet the people's legitimate needs, aware of the divine commands to a high degree. In the Islamic government, human beings are not the means of continuity of governments, but governments are the means of holy excellence and human talents flourishing.

4. **Protecting the rights of the people in governing and managing the Islamic state is a challenging thing**.

In the Islamic government, management is the cloak of service, not the disgrace of power under a trust that is considered the people's right. On this basis, accepting political, political, and managerial positions in Islam is done with full caution. This caution on the part of individuals in the Islamic society is the fear of violating the people's rights. In the bureaucracy, NPA, PVM, and the observance of others' rights are done only in the view of public morality. Still, in the Islamic society, public administration trustees must respect people's rights to avoid punishment in the hereafter. This internal motive has a very practical effect on the people's actions and speech in Islamic society. Accordingly, managers' internal control in Islamic society, that is, subjective responsibility in them, is a much more important mechanism than external control or objective responsibility. The scourge of violating the people's rights is a strong barrier against those who want to enter the public sector and serve as managers and employees of the people.

5. **Dedicate yourself to serving your servants and avoid mere governance.**

God revealed the Qur'an to guide humankind and has made religion the means for His servants to move toward Himself. Still, God has given the authority to accept His command to human beings and has not forced them to get religion. The prophets and Imams have guided humankind to the nearness of God with their good behavior and good speech and with reasoning and logic. The Prophet of Islam did not ask for reward in exchange for guidance and service to the people. Politicians, policymakers, managers, and government employees should dedicate themselves to serving the servants of God and not put a veil between themselves and the people. Therefore, pure governance is not permissible in Islam and has no place. Accordingly, public sector managers and employees must help people identify and pursue their real interests instead of pursuing controlling or leading society in the direction of their desired values.

6. **Be sensitive to the dignity of God's servants instead of focusing solely on organizational productivity.**

The protection of the servants of God is emphasized and approved by the Islamic government. Accordingly, although public sector management activities' productivity is essential, the protection of human dignity is considered more important. Public managers will be successful if they know the path to success in accompanying the people and consider cooperation based on mutual respect between the people and public administration as the key to this success. Therefore, those who enter the public sector and the citizens are more important than productivity and entrepreneurship. The love of serving God's servants as a reserve of the hereafter in them and self-sacrifice in the people's service is their desire. Managers and employees of the Islamic public sector see their presence as an opportunity to serve, not be promoted, gain social prestige, or earn more money. Therefore, in IPA, human dignity is considered a value higher than efficiency, effectiveness, and productivity.

7. **The actions and deeds of managers and employees are more effective in accompanying people than their words and sayings.**

The Muslims judge their rulers' and managers' actions and behavior and stare at their actions and deeds rather than focus on their

words and sayings. Hence, the negative consequences of a doctor's mistake, an architect, and a grocer are much less than the adverse effects of a government official's mistake. Accordingly, the observance of Islamic ethics principles in government officials and the Islamic government has been emphasized.

8. **Learning from others to improve the practice of IPA is a good thing**.

   Policy and managerial lesson-drawing to improve the performance and Islamic government are good and emphasized by Islamic sources. The Islamic learning government needs politicians, policymakers, managers, and employees who are continually innovating and modernizing tools and methods to pave the way for further growth and excellence of their country's people. In this way, do not hesitate to learn from other nations and tribes. The scientific and educational frontiers of the Islamic government on the humanities are always open to implementing religious values. The scientific-educational interactions of Islamic countries with other countries have been considered. Still, blind imitation without reflection has been considered a matter of necessity. To improve its performance, the IPA must continuously monitor the administrative sciences and learn the necessary lessons to improve its quality.

9. **IPA is the basis for the growth and excellence of God's servants.**

   The purpose of an Islamic government is to inject religion into politics to guide the people servants of God, and the Qur'an is their primary guide. On the other hand, the prophets' and Imams' (leader) statements also guide people to reach nearness to God. IPA is the vehicle and mechanism behind such a move. If this particular task is taken from IPA, its fundamental difference from other public administration will fade. Therefore, public managers and government employees' mission for providing public services and various goods is to pave the way for Islamic society's progress and excellence. The phrase "the world is the farm of the hereafter" will increase its possibility with IPA.

## IPA Study Framework

As mentioned, religion as a carrier of influential ideas in Islamic society's structure can affect human beings' behavior, speech, and attitude. Accordingly, in the previous sections, nine significant implications of religious sources were counted as a guide to Islamic society's managerial practice. They can be signs to guide the production of IPA knowledge, just as the NPS movement, based on its theoretical foundations, had seven main ideas to guide its administrative movement in the public sector. When it is said, administration in the public sector "refers to how it works with and by others in public organizations." The two words management and organization are companion and twin, and therefore every organization needs some management, and every scientific management needs an organization to show its functions in practices. Although management theories border on organizational theories, when it comes to public sector management, it refers to "what is organization and management in the public sector and how is it established?" The fact is that scholars must clarify the concept of organization and management and then study them. This section wants to provide a framework that can be used to study IPA. Accordingly, the characteristics of this study framework can be described as follows. The framework tells researchers what elements to focus on and design to produce IPA as a comprehensive package (Danaeefard 2015):

1. **Philosophical foundations of IPA**: The IPA's philosophical foundations, ontology, epistemology, methodology, anthropology, axiology, and the rhetoric of public administration knowledge, should be explored, studied, and drawn because every field that claims to produce science must define these foundations. Therefore, some lovers of IPA production should focus on researching and creating these foundations.
2. **Key values of IPA**: Values are accepted requirements that every manager must consider to achieve his goals. The manager wants to multiply his production but not at any cost

(efficiency is not the dominant value of his activities). Undoubtedly, IPA has goals; what values should an Islamic manager adhere to achieve his goals? Some IPA scholars can focus on this element, which has always been controversial in the controversy and competition between public administration movements. Each movement has focused on specific values. One emphasizes the effectiveness of the other on social justice and the other on the public interest. What are the Islamic government's values in the light of which the Islamic government adheres to pursue its goals? Values are the subject of good study for researchers.

3. **Objectives of IPA**: All managers in organizations pursue goals. One thinks of profit; the other thinks of people's satisfaction. What is the purpose of the IPA? Some researchers should focus on this element.
4. **The structure of the administrative system**: This element is manifested in a form called the structure of the administrative system or the same organizational structure. The theory of IPA should arrange the government's unique functions, the country's administrative system, and public organizations in different political arenas. Specify social, cultural, economic, etc. In other words, on the organizational structure of government organizations in the Islamic government, thinkers, researchers, and thinkers in the public sector should organize their research.
5. **Human resource management**: The second element that the theory of IPA should consider and draw is the foundations. What ideological, cultural, social, political, and skill characteristics should Islamic organizations' human resources have? How should this workforce be identified, selected, hired, trained, and evaluated? What is the appropriate human resource management device for this workforce?
6. **Appropriate methods and tools**: IPA theory should, in addition to designing the organization and managing human resources, also prepare methods and tools for performing tasks. Otherwise, the theory of IPA will not be complete. The Islamic administrative system must determine the appropriate tools and methods of processing affairs in the Islamic administrative system; different countries in different political, social, cultural, economic aspects, etc., design various tools and improve them every day. All methods and tools can be placed under a title called technology.
7. **How to interact with the people**: Another critical point that the IPA theory should determine is how people interact with public administration. All managerial movements in the public sector have commented on how people interact with the administrative system. Religious and jurisprudential sources on the relationship between the people and the government have presented views that can be used to rely on the proper relationship between government and the people. In other words, while maintaining administrative capacity, public administration must also keep the public bureaucracy's suitability for the Islamic system's top management. How to balance the three values of representation, neutral competence, and executive leadership?
8. **Management process in the administration of the Islamic public sector**: How should be the planning, organizing, leadership, control, coordination, and command in the Islamic public sector? This field should be studied by Islamic scholars.
9. **Organizational culture of IPA**: The study of organizational culture in the Islamic public sector is also critical.
10. **Relationships and interactions of the elements of the framework of the study of Islamic state management**: The fact is that the features of the theory of IPA are not passive and separate from each other. Hence, their precedence and latency are not very clear. For example, scholars can select the different components based on the people's interaction with the Islamic government. For

instance, if the people's relationship with the Islamic government is the relationship between the people and the Imam, what should be the characteristics of the philosophy, values, goals, and human resources required to implement Islam's scriptures? And what device should be designed to manage this force? And what kind of organization and structure should be the appropriate organizational structure with this human resources device? And what tools and methods should managers use? Other elements can be designed and linked according to legitimate Islamic tools and methods. Apart from these interactions, some research can focus on the one-to-one connection of several components.

## Conclusion

In this essay, the author has provided a framework for studying IPA. In this regard, the author has tried first to review the current works in administration and Islam and justify the production of IPA knowledge based on meta-theoretical studies. In the next section, by reflecting on the relationship between religion and religion, the author enumerates the underlying principles governing the behavior, thought, and speech of public officials in a normative manner and then conceptualizes the IPA movement inspired by new public services, the basic principles of IPA. In the final section, the author presents a framework for studying and researching Islamic government management.

# Islamic Strategic Management

Hassan Danaeefard and Mohammad Javadi
Tarbiat Modares University, Tehran, Iran

## Synonyms

Islamic competition; Islamic decision-making; Islamic planning

## Definition

Islamic strategic management refers to the process of thinking, analysis, decision-making, and action, which is based on Islamic methods and sources, in which individual, group, organizational, national, and transnational goals are pursued. Of course, it is unnecessary to extract from Islamic sources and Islamic methods from the beginning to the end of this process. However, Islam determines the primary orientation, and so experimental or nonexperimental sources can be used to achieve Islamic strategic management.

## Introduction

Everyone needs a strategy. Leaders of armies, major corporations, and political parties have long been expected to have strategies, but now no serious organization could imagine being without one (Freedman 2015). Therefore, strategic management literature is vast – the number of items reviewed over the years close to 2000 – and it grows larger every day (Mintzberg et al. 2005). Strategy-making can be approached from a descriptive and a theoretical perspective. In the last two decades, several excellent academic books have ably set out the significant issues involved. They have comprehensively reflected the ever-widening range of theoretical perspectives brought to bear on strategic management (Faulkner and Campbell 2006).

Unfortunately, it has also never been more challenging to choose the right approach. The number of strategy schools, approaches, tools, and frameworks that leaders can choose from has grown massively since the birth of business strategy in the early 1960s (Reeves et al. 2015). However, this coin also has a positive side. This diversity of schools and theories has made a choice difficult and has led to a better understanding of strategic management and its different aspects. In other words, each of these schools helps to complete the puzzle pieces and create a more accurate big picture of the strategy (Mintzberg et al. 2005). The more precise the strategic management schools are introduced, the better the strategic management knowledge body uses.

One of the schools that will be addressed in this entry is strategic management from the perspective of Islam, which created a unique strategic management paradigm that nurtured civility, prosperity, diversity, and happiness among people of different creeds and ethnic origins around the globe for more than 1000 years (Abbasi et al. 2010). Therefore, in this entry, Islamic strategic management has been reviewed throughout history and contemporary management to provide a more comprehensive overview to readers.

## Scope of Islamic Strategic Management Theory

The scope of Islamic strategic management studies is divided into two categories. The first group of studies is those that have been done within the field of Islamic strategic management (intradisciplinary), and the second group of studies is those that have tried to combine Islamic strategic management with other areas (interdisciplinary) such as policymaking, public administration, financial management, marketing management, etc.

## Intradisciplinary Studies in Islamic Strategic Management

In this category, researchers generally have two approaches: In the first approach, researchers try to use strategic management tools such as SWOT to analyze the history of Islam and Islamic issues. In the second approach, they try to reconceptualize the common strategic concepts in terms of Islam. Researchers who have taken this approach in content production in Islamic strategic management have generally dealt with strategic thinking, strategic management, strategy formulation, strategy implementation, strategy control, competition, etc. In the following, each of the topics considered by researchers in Islamic strategic management and research has been formed around it will be discussed, and their essential issues will be mentioned.

One of the topics that researchers in Islamic strategic management have addressed is the issue of competition. In connection with this issue, the competitive behavior of firms from an Islamic perspective is discussed. In fact, in Islam, competition, meaning the race for more profit, is neither wholly denied nor fully approved but is defined within the framework of Islamic rules and regulations (Mirmoezi 2008). The main rules discussed by researchers in this discussion include not harming the competitor, no hoarding, no selling underweight, etqān at work, observing the Islamic system's general interest.

Other intradisciplinary topics in Islamic strategic management that have attracted the attention of researchers is strategic thinking. In this field, the

primary research focused on designing a strategic thinking model or extracting the factors affecting it. Factors affecting Islamic strategic thinking are divided into two categories (Monavvarian 2014); first, the elements extracted from Islamic sources include insight (Basirah), Hazm, patience, operational experience, mansuetude (Helm), thinking over time, and consultation. The second category has been extracted from empirical sources but has also been approved by Islam. These factors are as follows: analytical capability, thinking about future, mental cognition, environmental analysis, recognition of internal factors, continuous learning, considering the signs, focus on issues, considering mortality of rules governing the world, good seeing, good listening, consultation with experts, making use of intuition and insight, understanding the distinctions and differences, critical thinking, learning from experiences, and being up to date about the science.

Also, several kinds of research have been done in designing the strategic management process from the perspective of Islam. The most critical issues that have been considered in these studies are: Islamic goal setting and its relationship with Towhid, presuppositions of the strategic management process such as Hikmah versus rationality or Rizq versus profit, ethical principles governing the strategic management process such as the principle of patience, perseverance in work, etc.

Another intradisciplinary research topic that researchers in Islamic strategic management have shown great interest in is strategy formulation. Research issues in this topic include the correct planning method from Islam's perspective and the principles governing the strategy's formulation, such as simplicity, obedience, and moderation. One of the most critical issues in strategy formulation is to discuss Gaza and Gadar, and Islamic scholars have made great efforts to link this issue and formulate a strategy.

Scholars in strategy implementation have also pursued Islamic strategic management. Scholars of Islamic strategy believe that the high rate of failure in strategy implementation is due to conventional strategy incorrect theories. Some strategy implementation failures can be prevented by providing Islamic solutions (Fontaine and Ahmad 2013). In this regard, issues such as Islamic leadership and its place in implementing Islamic strategies, Islamic organizing, organizational culture in Islam, etc., have been researched.

Also, in strategic control, various issues have been addressed, including control levels (God, angels, leaders, people, the individual, and the individual's body), principles, and types of control from an Islamic perspective. Among the issues that researchers have addressed in designing the principles and types of control are the following: self-control through witnessing and observing Allah, observing justice, two-way control that is both from employees to managers and from managers to employees, public supervision and public responsibility towards the goals of the Islamic society and its implementation through enjoining the good and forbidding the evil, and the principle of preventive control over catch someone in the act.

Researchers have considered the above topics. But certainly, there are issues that researchers have not yet addressed. The rule of research in this category is: the researcher identifies one of the key concepts (such as competition, stakeholders, competitive advantage, emerging strategies, etc.) in conventional strategic management and then with Islamic sources and Islamic methods redefine it or define it by recognizing the operational need in the field of strategic management, both from Islamic sources and from operational experience, using Islamic sources and methods.

## Interdisciplinary Studies in Islamic Strategic Management

In this category, researchers try to combine Islamic strategic management with other disciplines. Among the interdisciplinary research in this area, four disciplines have attracted researchers' attention more than other disciplines: finance, public administration, public policy, and marketing.

Islamic strategic management in finance generally deals with how the company should treat its stakeholders in the long run. In fact, in this area, an attempt is made to establish a kind of balance between the company's profits and the stakeholders based on Islamic values and contracts,

which in the long run can regulate the overall benefit of society. In this area, strategic management sometimes goes beyond the stakeholders' concept, common in conventional literature, and engages the right holders. Freeman (1984) defined a stakeholder as any "group or individual who can affect or is affected by the achievement of a corporation's" (p.vi) or "organization's purpose" (p. 54), "firm's objectives" (p. 25), "organization's objectives" (p. 46), or "performance" (p. iv). But the right holders are first identified by God and, secondly, may not directly influence the company. An example of these rights can be seen in Imam Sajjad's treatise on rights. It can be argued that it is in the continuation of this discussion that Islamic strategic management identifies the types of contracts between two right holders. For example, suppose Riba becomes forbidden, and Mosharekah becomes lawful.

Another interdisciplinary area that Islamic strategic management deals with is making economic development policies in Islamic countries. In this area, the Islamic strategy tries to formulate visions, missions, and strategies by focusing on Islamic countries' Islamic sources. Among the essential issues in this area – policymaking – that Islamic strategic management must address is the originality of the structure or agent, the essence of social profit or person utility, private or public property, and government intervention in the economy, the definition of justice, etc.

Researchers have considered the above topics. But certainly, there are issues that researchers have not yet addressed. The rule of research in this category is: the researcher identifies one of the key concepts (such as competition, stakeholders, competitive advantage, emerging strategies, etc.) in conventional strategic management and then with Islamic sources and Islamic methods redefine it or define it by recognizing the operational need in the field of strategic management, both from Islamic sources and from operational experience, using Islamic methods.

This section tries to select the interdisciplinary fields that have most related to public policy so that researchers can see a more comprehensive picture of Islamic strategic management. However, there is no claim that the complete image is provided. Other interdisciplinary topics, such as the relationship between strategic management and marketing, decision science, etc. may also be of interest to researchers, which was omitted due to this encyclopedia subject.

## Islamic Strategy in Practice

So far, an attempt has been made to discuss the areas theoretically covered by Islamic strategic management so that researchers can approach research in this field with a regular structure. But now, I want to give a brief operational picture of strategic Islamic management that strategists can use in practice.

- Islamic management practiced by former Muslim civilization was so successful that the Muslims could conquer half of the world (Sulaiman et al. 2013). Therefore, referring to the cases implemented at the beginning of Islam can provide an operational picture of the strategy. The following are four of the most critical strategies in practice. Of course, examples of strategy implementation are not limited to these cases, and hundreds of other topics can be examined, and these four are just for the readers' familiarity:
- The Hudaybiyyah peace strategy used by the Prophet Muhammad led to the victory over the Meccan army.
- The Shorte Al-Khamis strategy was used by Ali ibn Abi-Talib, the Islamic management father, to organize and orient dispersed and spontaneous pro-government groups to advance its goals.
- Ali ibn Abi-Talib's strategic positioning by changing the Islamic government's capital from Medina to Kufa. This action increased his dominance over the government, and he managed the three major uprisings well. This positioning was repeated in the battle of Safin, and he took the top position in the struggle.
- Inventing the method of budgeting and distribution of government assets to implement Ali ibn Abi-Talib's grand strategy to establish justice.

## Conclusion

In this entry, an attempt was made to describe "Islamic strategic management," its foundation, and theory and practice scope. There is no claim that our theorizing in this field is perfect and accurate, but an attempt has been made to make the introduction as good as possible. This field's status was described by reviewing its theoretical scope in two categories, intradisciplinary and interdisciplinary, and then presented operational cases to acquaint the audience with this field in practice.

It should be noted that passing these steps is not easy at all. If people think that achieving Islamic strategic management is easy, they will eventually present a caricature. It seems that to advance this scientific field, scientists should work in three areas: strategic management in the university, Islamic studies, and managing in practice. By using all these three, they can advance Islamic strategic management both theoretically and practically.

# Issue Networks: The Policy Process and Its Key Actors

J. Travis Bland and Kofi Abaidoo-Asiedu
Department of Public Administration, University of Illinois at Springfield, Springfield, IL, USA

I

## Synonyms

Policy network; Policy subsystem

## Definition

Iron Triangle: Alliances of congressional committees, executive/administrative agencies, and interest groups that control major policy areas.

Issue Network: A shared knowledge group that can be populated by a wide and unpredictable number of actors who are devoted to the issues and not each other.

Policy Technocracy: A policy process that is dominated by actors with specialized issue expertise or knowledge.

## Introduction

Numerous studies have shown that the policy process and its key actors may differ considerably across policy domains. Introduced and reviewed by this chapter, the concept of the issue network (Heclo 1978) is now part of a broader literature that is devoted to making sense of the key actors, including who participates, who wields the power,

and how they organize to exert influence on the policy process. Although a radical departure from the traditional conceptualization of this process, for a host of policy domains, the issue network is a better depiction of the complex relationships among policy actors and assists in understanding outcomes. After exploring the emergence of the issue network, this chapter reviews the related implications for the democratic state and discusses recent advancements in this broader stream of literature.

## The Emergence of the Issue Network

In his seminal article, "Issue Networks and the Executive Establishment," Hugh Heclo (1978) developed the concept of the issue network as a way to describe his observations of an increasingly open and fractured policy process in Washington, DC. According to Heclo, the widening scope of many public policies had generated a push-pull effect in the relationship between democratic politics and the executive establishment. As aspirations for improvement were thrust on the government, rather than growing a national administrative structure, he observed a continued shift in policy actions by intermediaries. The intermediaries included state and local governments as well as private contractors, consultants, and other issue-conscious advocacy groups. This trend politicized the organizational role of the public executive and mobilized a widening number of actors who hoped to exert influence on the policy process. Now less involved in the direct execution of public programs, executives had to navigate these complex systems, mobilize intermediaries, and make highly important decisions on society's behalf. Thus, they had to be highly knowledgeable about the substance of particular issues and acceptable to the proliferating groups now claiming an interest in the choices being made. This pulled the executive further away from "the nontechnical, non-specialist understanding of the ordinary citizen and politician" (p. 94).

Increasingly, as argued by Heclo, it was the public executive's reputation among those "in the know" that made them available for presidential appointments. Unlike executives of the past, they were policy politicians not partisans. This meant that they were engaged in issue politics more so than democratic politics. Thus, they had limited ties to a party or to the electorate. Heclo observed them moving in and out of ad hoc, loose alliances that were forming among interest groups and individuals, both in and out of the government. The actors in these alliances were seeking influence commensurate with their knowledge of particular issues. Connected through the issues, they were part of a burgeoning policy technocracy that also included many subordinate positions to the executives. Heclo warned that these changes in politics and administration were complicating a once-stable political system and its definitive reference points. It had become difficult to distinguish the governmental structure from its broader environment. As such, the predominant depiction of the policy process and its key actors as a subgovernment or iron triangle was, according to Heclo, a disastrously incomplete anachronism (Berry 1989). Thus, he developed the concept of the issue network as more accurate depiction that would assist in understanding many modern policy outcomes and serve as a vehicle for him to share his concerns over the corresponding threats to democratic legitimacy. Heclo's concerns and observations raise several questions that warrant further consideration. (1) Should the iron triangle still be recognized as the most influential hub of policymaking in Washington, DC? (2) Are there any potential benefits associated with the emergent influence of issue networks? (3) Do issue networks pose a threat to the democratic state?

## Iron Triangles Versus Issue Networks

Prior to the conceptualization of the issue network, the policy process was thought to be relatively closed and segmented, such that each policy domain was dominated by a limited collection of privileged elites (Dahl 1961; Lowi 1969; Truman 1971). Many utilized the triangle imagery to suggest that power and control were vested in mutually reinforcing and beneficial relationships

among outside interest groups, congressional committees, and executive agencies who shared a stake in a particular policy (Cater 1964; Freeman 1965; Griffith 1939). Here, policymaking was thought to be consensual, thereby stabilizing policy content. Quiet bargaining, including the exchange of political favors and support, produced a level of rigidity that made these systems somewhat impenetrable by outsiders – even by the president. Yet, for a host of intricate and confusing policy initiatives, Heclo argued that the familiar politics of the iron triangle had evolved or was being overlaid by issue networks.

Heclo (1978) stated that in "looking for the closed triangles of control, we tend to miss the fairly open networks of people that increasingly impinge upon government" (p. 88). Built on pluralist notions of power, the issue network describes a policy process where it is all but impossible to identify the dominant actors (Jordan 1981). Here, power is disaggregated and access is predicated on the development and exchange of information and knowledge. Issue networks, then, are shared knowledge groups that can be populated by a wide and unpredictable number of actors. This may include the elites referenced above, but also may include White House aides, bureaucrats, consultants, policy advocates, researchers, and other highly knowledgeable individuals. The functions of these individuals may spread across agency jurisdictions and incorporate citizens who were initially excluded from the iron triangle (Milward and Wamsely 1984). Referred to by Heclo as an intramural activity, many policy domains are now populated by just as many expert issue watchers and policy activists as they are governmental actors. These actors may move in an out of issue networks rather freely (Berry 1989). Network boundaries are somewhat sloppy because the issue areas may overlap and the alliances are open-ended and loose, such that new alliances may form around the differential effects of enacted policies.

As such, the actors in issue networks do not necessarily know, nor agree with, one another. They are not trying to garner some mutual benefit or uniting in dominance over a policy or program. They are intellectually and/or emotionally committed to the issues, not each other. Thus, their interactions do not always produce agreement, mutual dependence, or collective action as with an interest group. Participation is characterized by irregular, but intensive, interactions where actors exchange ideas and compete to redefine particular issues and influence their politicization. Issue networks, then, may lack the stable set of relationships and the shared commitment to compromise characterized by the politics of the iron triangle (Berry 1989).

Whereas the iron triangle depicts a policy process that is tightly bound, orderly, and predictable, the issue network depicts a policy process that is relatively permeable, amorphous, and, often, highly conflictual (Gais et al. 1984). The former continues to have significant influence over the analysis of public policy (Birkland 2001; Chubb 1983). Yet, the iron triangle structure is not consistently observable across all policy domains (Miller 1985). More and more policies and programs have become quite controversial, which supports Heclo's argument that something less closed and secretive than the politics of the iron triangle must exist (Wilson 1980). In many policy domains, by shifting the focus to the many loose jointed "webs of influence that [now] provoke and guide the exercise of power" (Heclo 1978, p. 102), the issue network may be a more accurate and useful depiction of the policy process and its key actors. The scope of the government along with its complex programs and the need for results inevitably paved the way for more issue experts and policy advocates.

## Issue Network Politics and the Threat to Democratic State

Both conceptualizations were, as argued by Grant Jordan (1981), critical commentaries highlighting important differences in the American politics of the 1950s–1960s and of the 1970s–1980s. Whereas criticisms of the iron triangle were aimed at limitations on access to the policy process, Heclo was critical of the emergent influence of what he felt amounted to a policy technocracy.

As described previously, the growing number of policy commitments and the corresponding use of intermediaries had increased Washington's reach, thereby generating a number of hybrid interests and new actors hoping to exert influence on the policy process. Thus, there was a growing need for more rigor in the analysis of policy choices, which increased the value of specialized issue expertise. Now referred to as issue networks, Heclo (1978) observed that it was "through networks of people who regard each other as knowledgeable, or at least needing to be answered, that public policy issues tend to be refined, evidence debated, and alternative options worked out" (p. 104). Often unknown to the public at large, many of the top public executives in Washington, and their subordinates, were being referred for appointment because of their reputations among these issue networks. Heclo warned that this policy technocracy may well generate more informed policy debates and widen participation in the process, but it may do so at the expense of democratic legitimacy. He stressed the disintegration of the once-stable political reference points around which political coalitions were ordinarily built, such as the political parties, which helped the general public identify with their government.

According to Heclo, issue network politics did increase the maneuvering room of public executives. Assuming the role of a policy politician, it allowed them to split and recombine the many sources of support and opposition to issues. Yet, he was critical of the unpredictable and disorganized decision-making process accompanying this style of politics and a consequent tendency, from the viewpoint of the general public, for policy debates to drift toward the controversial and incomprehensible. His criticisms cover several differences in issue network politics and democratic politics and their consequences for policy outputs.

Heclo believed the growing technical complexity associated with issue networks made democratic politics more difficult. He focused his reasoning around four themes: complexity, consensus, confidence, and closure. First, democratic politics tries to simplify complex problems and offer a few intelligible choices, whereas issue networks gain influence by searching out the complexities. It is in dealing with the complexities that network actors can gain a reputation for being knowledgeable and are needed. This, however, may push the debate beyond the comprehension of the general public. Actors may also define the issues within the political systems based on their beliefs and preferences rather than representative politics. Second, the aim of democratic politics is the achievement of some level of consensus, but issue networks tend to reward intransigence or antagonistic behavior (Jordan 1981). It is deemed a sign of intellectualism. Often a site of contention, then, the actors' understanding of the issues tends to trump any desire for agreement. More and more issues, then, are politicized and infused with controversy. This makes many more policy outcomes unpredictable. And, lastly, in democratic politics, leaders are expected to be sure of themselves and quite definitive about what is to be done. Democratic politics favors decisive action, whereas the incentives in issue networks work against the closure of debate. Here, actors are rewarded for challenging accepted wisdom and continuously weighing alternatives. After all, the goal is to provoke and guide the exercise of power, not to collectively take action and control policies or programs.

A potential threat to the democratic state, issue network politics tends to fragment rather than segment policy actors. As argued by Heclo, there is no fixed, identifiable power structure or stable set of actors for the general public to identify with or that is open to presidential influence or bargaining (Jordan 1981). The policy technocracy has developed its own rhetoric or way of arguing policy choices and looking at the world that generates further complexities and exacerbates the need for more specialized expertise. The technical nature and intricacy of the policies developed via the influence of issue networks create a knowledge-driven environment that necessitates a heightened level of expertise to maneuver and exert influence on the policy process. Thus, for a host of policy initiatives, issue network politics is likely the new normal. Yet, as Heclo (1978) argues this will "impose considerable strains on those charged with government

leadership" (p. 105). The policy activists and issue experts are likely to remain unsatisfied with, and the general public disconnected from and uncommitted to, what the government is actually debating and doing.

## Policy Subsystems, Issue Networks, and Learning

As part of a broader literature that attempts to make sense of the policy process and its key actors, the iron triangle and the issue network are two distinct and contradictory views. While some continue to argue over which is the most typical and most descriptive depiction (Berry 1989), Heclo offered the issue network as an overlay to, not a replacement of, iron triangles. Issue networks come into and out of existence when a policy issue becomes compelling, while the triangles tend to remain. Thus, he was among the first to argue that there might be several different structural arrangements through which actors might attempt to exert influence on the policy process. As this broader literature has unfolded, there has been some disagreement over terminology. Nonetheless, the actors or potential actors who share an interest in a policy domain or substantive area are generally referred to as a policy community (Atkinson and Coleman 1992; Linquist 1992; Pross 1986), while the differences in who actually participates, who wields power, and variations in the levels of integration are often situated on a continuum of policy networks or subsystems (Atkinson and Coleman 1989; Jordan 1981; Marsh and Rhodes 1992). Elitist and tightly coupled subsystems like the iron triangle are often situated at one end of these continuums, while pluralist and loosely coupled subsystems like the issue network are situated at the other end. These continuums are often employed in the field of comparative policymaking (Campbell et al. 1989) as frameworks for exploring the relationship between differences in subsystem structures and policy outcomes (Hallacher 2005). In the process, as stated by Atkinson and Coleman (1992), "institutionally imposed boundaries to research have been broken down and replaced by a more fluid and less restricted view of the policy process" (p. 162).

This subsystems' view, however, may not adequately capture the ebb and flow of policymaking over time (Birkland 2001). Baumgartner and Jones (1991, 1993) argue that policymaking follows a pattern of punctuated equilibrium, where relatively long periods of stability are punctuated by rapid bursts of change. This is consistent with the potential for iron triangles to periodically break down – possibly due to a sudden shift in how problems are understood or in the balance of power. Issue networks, however, portray a much different ebb and flow. They depict a policy process that is in a state of constant conflict and flux. Yet, it is the intermediate level or nature of this conflict, described both as "antagonistic cooperation" (Marin and Mayntz 1991) and "persuasive discourse" (White 1994), that many now suggest creates increased opportunities for learning and change (Hallacher 2005; Sabatier and Jenkins-Smith 1993). Contrary to some of Heclo's initial criticisms, then, several scholars now argue that, when compared to an iron triangle, the issue network can create an environment that is more conducive to learning, which makes it more stable and less likely to be dramatically altered or destroyed (Baumgartner and Jones 1993; Sabatier and Jenkins-Smith 1993).

Several scholars now look to Sabatier's (1988) advocacy coalition framework (ACF) to make sense of issue network politics and suggest that they are much less chaotic and unstable than originally portrayed by Heclo (Birkland 2001; Hallacher 2005). The ACF draws attention to the coalitions that form around beliefs and values within a policy community. Sabatier and his colleagues claim that two to four advocacy coalitions can be found in most policy communities, whereas one typically emerges as the dominant coalition that controls the levers of power. Similar to the actors found in issue networks, these coalitions may include public executives, other bureaucrats, interest group leaders, researchers, experts, and other individuals who share a particular belief in a policy. Yet, whereas Heclo portrays these types of coalitions as ad hoc and loose, the ACF suggest that they are quite stable. Their

unwillingness to move on core values and beliefs, while allowing movement on items of secondary importance, generates stability. As actors seek a better understanding, conflict between coalitions when maintained at intermediate levels enhances the potential for policy learning and change (Sabatier and Jenkins-Smith 1993). Despite its explanatory value, the ACF, and other advances in this literature, have not adequately addressed Heclo's criticisms related to how these structural arrangements might improve the policy debate at the expense of democratic legitimacy.

## Conclusion

Heclo (1978) developed the concept of issue networks as a practical and, perhaps, more realistic depiction of an open and fractured policy process in Washington, DC. Increasing complexities related to the widening scope of public policy and the use of intermediaries sparked a new dynamic in which the need for specialized issue expertise had heightened the tension between the administrative state and democratic principles. As argued by Heclo, this new dynamic is likely to endure. Networks of policy specialists have established their importance, such that there is no way to reverse the expectations and desire for more in-depth knowledge. Yet, while many scholars share Heclo's recognition of the evolution of the familiar politics of the iron triangle and continue to explore the potential differences in the structural arrangements through which actors might attempt to exert influence on the policy process, few have given adequate attention to his criticisms of this evolution. Thus, the impact of the emergent influence of issue networks and other structural arrangements on the democratic state deserves further consideration. Consider, for example, the following questions. Does decision-making that works against the closure of debate generate learning or policy drift? Do issue networks and other open structural arrangements expand participation in a pluralist fashion, or is the expansion limited in other elitist ways? And how does this evolution in the policy process and the growth of a policy technocracy relate to the ongoing decline in the public's trust and confidence in the government?

### Synonyms

Islamic Political Parties; Protest; Residential election

### Definition

212 Reunion rally in Indonesia is a symbolic rally of an antigovernment opposition march from 2016 to 2018. 212 reunions have transformed into a movement not only aim to stop the liberal and leftists coming to power alongside Ahok in Jakarta Governor election, but also pose a challenge to the re-election of President Jokowi parliamentary and presidential election.

### Introduction

December 2 is a historic date for opponents of President Joko "Jokowi" Widodo, because on this day exactly 2 years ago, they successfully mobilized thousands of Islamic fundamentalists and religious conservatives in the streets of Central Jakarta to demand the arrest of then-Governor Basuki "Ahok" Tjahaja Purnama on blasphemy charges. Dogged by the allegations and continuous protests by Islamists, Ahok, who was endorsed by the ruling Indonesian Democratic Party of Struggle (PDI-P), which also backs the current President Jokowi, has lost his bid for re-election on April 19, 2017 to Anies Baswedan, who was backed by Prabowo Subianto, the leader of the opposition Great Indonesia Movement Party (Gerindra). Three weeks later, the North Jakarta District Court handed down an unexpectedly harsh sentence, jailing the ethnic Chinese Christian governor for 2 years for insulting Islam. His crime: referencing a Koranic verse during a campaign speech the year before.

### The "212 Reunion"

Saturday's (2/12) gathering in Jakarta that was held by hardliners of opposition supporter ended peacefully as previously expected. But, the total number of people attending the event remained

A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

unclear as almost all major media outlets made no mention of it. Detik.com reported that no more than 40,000 people took part in the rally, quoting police officials and a researcher from Bandung's Universitas Padjadjaran. This figure was far below the event organizers' claim of 7.5 million people, which few people believed. Beside the difficulty to estimate the number of participants in such large open-air meetings, many researchers may fear that mentioning any number close to facts on the ground could put them in danger.

For the organizers of the so-called Reuni 212 themselves, the number of Saturday's rally participants meant a lot as it strongly signaled the great power of Indonesia's hardliners as they had repetitively claimed and wish to retain. The act of Reuni 212 provide a sense of togetherness. One of the reasons is the psychology of the crowd that is related to the affirmation of one's identity. Since the beginning of the theory of crowd psychology emerged, namely, in Gustave Le Bon's book, The Crowd: The Study of the Popular Mind, published in 1895, crowd psychology is explained in a model of "group thinking" (group think). In this model, participation in crowd action results in the loss of one's rational thinking ability. According to Le Bon, the character of the crowd will cause someone in it to lose their sense of responsibility and will feel that the behavior in the crowd is universal.

In the crowd, someone will lose reasoning ability, the ability to judge critically, and tend to exaggerate feelings, sentiments, so that someone's emotions in the crowd can overflow. The model of Le Bon's legacy think group to understand crowd psychology seems to fit the New Order's mass management model, which identifies mass action with acts of mobs who have no rules, and therefore tend to be banned by the Suharto regime. This model is also suitable for the needs of some people to consider 212 and 212 Reunion Demo participants as "stupid", "stupid," "uneducated" mobs.

Moreover, the method of building togetherness through a crowd is also usually done without the attributes of religious identity. A more appropriate model for explaining the authentic feeling of togetherness in the demos of group 212 is the *social identity* model of Stephen D. Reicher, as stated in his paper, *The Psychology of Crowd Dynamics* (published in M. Brewer & M. Hewstone (Eds.), *Self and Social Identity*, Blackwell, 2004). In this model, a person has multiple identities, namely, individual identity and social identity. Individual identity defines how "I" is unique compared to other individuals, while social identity defines how "we" are different compared to members of other social categories in society. Reacher emphasized that social identity is always tied to the ideological tradition: how we define a social category that becomes a vehicle for one's membership and "other" social category attached to ideological traditions. A person has a social identity as a Muslim, a socialist, a nationalist, or even a *punk*, and thus becomes understood why he does anything in the context of grouping in a crowd.

Reicher quotes Turner, revealing: "*On defining ourselves as categories we participate in a process of self-stereotyping." When we define ourselves as members of a social category, we participate in a self-stereotyping process*. We determine what actions are considered appropriate in the context of grouping, and we adjust. We hope that fellow group members do the same thing. We agree with members of the same category group in matters that maintain group existence.

In that situation, what happens in a crowd according to Reicher is not the loss of individual identity but the shift to social identity that is considered appropriate or relevant in the group of categories that are followed. Likewise, what happens is not a loss of control over actions, but a shift in the basis of the category of a behavioral control. The act of molesting a mother dressed as a political opponent or harming certain media reporters who are deemed to lie about their groups is not a reflection of the loss of control or ignorance of the masses, but rather a manifestation of actions that can be accepted by groups because they are enforcing group identity (Ahmad Sabri 2014). Although attended by millions of Indonesians, the reunion event was orderly and participants upheld the norms of democracy which is the basis of the Unitary State of the Republic of Indonesia (NKRI) by maintaining good manners and

hospitality even when in a crowded space. We believe, those attending truly understood their loyalty to the Indonesia Constitution (NKRI) and the Pancasila together with the national motto *Bhinneka Tunggal Ika* and practiced it by acting with tolerance. The 212 Reunion participants also knew the history of the birth of the NKRI and the Pancasila, while maintaining harmony and caring for the nation. They were aware of the importance of cleanliness, orderliness, and safety while demonstrating.

## Methodology

For the purpose of this research we use survey methodology with multistage random sampling done by Lembaga Survey Indonesia (LSI) in 2018. Survey is done from the period of 5–12 December 2018, covering the whole Indonesia population. We manage to have 1200 respondent where all of them are met face to face and our enumerator asked questing using fix questionnaire. Above all the margin of error at the pace of + − 2.8%.

## Findings

Below are list of questions and the result of survey done in this study;

### Do you Know or Have Heard about 212 Reunion?

Question 1 help this study to explore the depth of understanding and information that respondents have about Reunion 212. Out of 1200 respondents, a total of 702 respondents (58.5%) answer yes, and 456 respondents (38%) stated that they have no knowledge about reunion 212. Meanwhile, 3.5% (42 respondents) didn't reply at all (Chart 1).

### Did you Support 212 Reunion?

In Question 2, respondents whom answer Yes in Question 1 (a total number of 702 respondents) were asked about their support towards 212 reunions. Half of the Question 2, 54.5% (382 respondents) answer yes, and 26% (183 respondents) says no and 19.5% (137 respondents) decline to give an answer (Chart 2).

**Jakarta Reunion of 212 and Its Impact Towards Indonesian Presidency Choice, Chart 1** Knowledge about 212 Reunion

**Jakarta Reunion of 212 and Its Impact Towards Indonesian Presidency Choice, Chart 2** Support 212 Reunion

**Jakarta Reunion of 212 and Its Impact Towards Indonesian Presidency Choice, Chart 3** Choice of Candidate

### If Presidential Election Is Done Right Now, Who Will you Choose?

Question 3 is the gist question of this study. Among the two most prominent candidate for the coming Indonesian Presidential election, all respondents were asked to reveal their selective candidate. Despite of all criticism and local disapproval, Joko Widodo still lead as the preferred candidate with a total of 54.2% (650) respondents' choice and Prabowo Subianto with a total of 30.6% (367) respondents. Nonetheless, there are still undecided numbers of respondent, 15.2% (182) respondents (Chart 3).

### Major Findings

The major finding of this study suggest that President Joko "Jokowi" Widodo remains in the driving seat, while challenger Prabowo Subianto trails behind in this coming 2019 Indonesian election. It is believing that among the key contribution to the coming presidency election success of the President Jokowi presidency was the appointment of Erick Thohir, who was the Indonesian media tycoon behind the Indonesia successful hosting of 2018 Asian Games. Erick Thohir, owns many big and successful business including, a multi-platform media company, football clubs, basketball club, and many more. In fact, Erick Thohir also chairs the Indonesian Olympic Committee (KOI). According to President Joko,

> "But what is clear is that whatever he (Erik Thohir) leads, is always followed by success." (Markus Junianto Sihaloho and Yudo Dahono | Jakarta Globe, on 11:44 AM September 09, 2018, https://jakartaglobe.id/news/businessman-erick-thohir-to-lead-jokowis-re-election-campaign/)

Many anticipated that this collaboration will lead to a major financial and economic stability and progress to Indonesia socioeconomic future situation. Apart from the appointment of Erick Thohir, from our analytical study survey results, it was found that there were five reasons why the 212 Reunion did not affect the electability of presidential candidates.

(i) *Strong Credence Among Indonesian voters*

The first reason is that the majority of voters who like Reunion 212 already have a difficult attitude (strong believe or strong credence) that cannot be influenced by Habib Rizieq Syihab easily. Especially, in

regards to the issue of the Islamic constitution and the call to replace the president.

(ii) *Jokowi's Performance*

Secondly, this study finds that the satisfaction with Jokowi's performance in general is still high. The evaluation of Jokowi's performance as president has not changed much before or after Reunion 212.

(iii) *Ma'ruf Amin Candidacy*

Thirdly, this study finds that Ma'ruf Amin nomination as Jokowi's vice-presidential candidate was the leader of the clergy. Ma'ruf Amin is considered to be Jokowi's anchor for Muslim voters.

(iv) *Jokowi* versus *Ahok*

Fourthly, 212 Reunion fails to discredit Jokowi. 212 Reunion is considered not to be used as a means of discrediting Jokowi as when Acting 212 was an attitude towards a case of blasphemy which struck Basuki T Purnama (Ahok). Infact, Jokowi is different from Ahok.

(v) *Probowo*

Finally, till today there is no substantial recorded number of voters who follow or left Prabowo due to Reunion 212. The total number is not significance.

## Conclusion

The big alumni reunion took place again, 2 years after its founding at the end of 2016. The 212 groups were initiated by the Islamic Community Forum and various other mass organizations. The action then held again on March 31, 2017. Previously, on November 4, 2016, a rallies to defend Islam also took place in the same place. Based on the context, what impact of the 212 event to our nation's democracy and politics interests today? If we look back the history of emergence of Islamic populism movements in Arabians, there are a tendency used by "oil-rich countries" to produce ideology of Islamic populism as a resistance to US hegemony. For example, the appearance of Ayatollah Khomeini in Iran is a real manifestation rising of Islamic populism. Similarly, the Islamic populism movement overthrew authoritarian regimes in Egypt, Libya, Tunisia, and Yemen, which until now has become a symbol of the movement of Islam through the wave of "Arab Spring," including Indonesia. The rise of religious-based populism in Indonesia is becoming a new trend as well. Previously, issues on populism had resonated through the left Islamis group and several others. The return of high religious enthusiasm was marked by the rise of mass religious adherents lead the teachings of religion as a moral message, as well as political struggle. The accentuation of religion by middle-class Muslims has undergone a model change which is increasingly interesting to observe. Reunion 212 has indeed been completed, but the conversation has not ended until today. For example, the debate about the number of participants present to the interpretation of the electability level of the candidates for the 2019 Presidential Election after the reunion took place.

Anticorruption measures; Bid rigging; Bidding reform; Bribery; Comprehensive bidding evaluation method; Corruption; Nomination bidder system; Open tender system; Predetermined price; Public procurement reform; Tender system

## Definition

The tender bidding systems of public works in Japan as mainly a tender by a nominated bidder

system prior to 1990s; since the mid-1990s, the bidding system has increased and is growing in application in government, with a need to further reform for transparency and confidence building.

## Introduction

Bidding system reforms in Japan were mainly implemented from the late 1990s to the beginning of the 2000s. How and for what purpose the reform was initiated and promoted is the subject of this entry. First, the types of bidding systems are outlined; second, the positive and negative aspects of each bidding system are discussed; and third, the process of bidding system reforms is explained.

### Types of Bidding Systems

In the process of implementing public works, public officers first choose a construction company by using a bidding system, then a contract proceeds with implementation. The bidding system is an open tender system, according to the Public Accounting Act and the Local Autonomy Act. But the government can use a nominated bidder with a private contract or if the government can approve it with a Cabinet decision (Public Accounting Act, Article 29-3, Paragraph 1, 3, 5, Local Autonomy Act, Article 234, Paragraph 1, 2).

Before the 1990s, the tender systems of public works introduced by public officers were mainly a nominated bidder system, not an open tender system. That system changed however, and the open tender system was introduced into large-scale projects to solve or reduce the problem of corruption in the relationships between politicians and construction companies and upon a request from the United States (Cabinet Office 1994; Mita 2010; Nihon Keizai Shinbun 1991; Nihon Keizai Shinbun 1993; Asahi Shinbun 1991).

In the open tender system, the government officially announces its tenders and requests eligible construction companies to join in the tender process, in order to select the lowest bidder, while also taking safety measures into consideration. In the old nominated bidder system, on the other hand, the government used to nominate about five eligible construction companies to bid. Then the government would choose the lowest bidder, with the safety measures taken into consideration.

In both systems, the successful bidder is the contractor who shows the lowest reasonable, but predetermined, price. Yet, under the open tender system, more companies can and do participate in the process. Predetermined price is the upper limit of the implementation of the project budget when the government implements competitive bidding. It decides an estimated price that can cover a contractor with standard abilities to undertake the construction with standard skills and prices. In a private contract, the government chooses an appropriate construction company without bidding due to an emergency or if there is no other appropriate construction company available. There is a possibility of bid rigging. In bid rigging, a contractor is decided in advance and the other contractors agree not to underbid him. If contractors cooperate in such a scheme, they will surely profit from it in the end because eventually their turn will come to be chosen as a successful bidder (Tonoike 1996, pp. 164–165).

There are two kinds of bid rigging: One is implemented by cooperation among construction companies, the other by go-betweens of politicians or public officers to choose the contractor for the public work or project. This is where chances of corruption rise and make the whole process profitable for contractors, bidders, and related politicians and administrators.

### Positive and Negative Aspects of Each Bid System

The reasons why the government did not use an open tender system, but introduced a nominated bidder system, are as follows.

First, the government can reduce the burdens of deskwork, such as like qualification inspection of the contractors because only contractors who are nominated by the government can enter the bidding. Second, the government can get a sense of security from the nominated contractors because they have chosen them. Third, the government can protect and promote the local economy by nominating local contractors.

In the nominated bidder system, however, there are several problems: There are problems related to the nomination of contactors, because only contractors who are nominated by the government can enter the bidding; they try to get nominations by asking politicians to put in a good word for them or appeal to government officers directly. Additionally, there is the problem of leaks of the predetermined prices. Because contractors who submit a price that is substantially more than the predetermined price are disqualified, the information related to the predetermined price is important. Because of this, the contractors would try to find out what the predetermined price is by approaching politicians and public officers for that information (Tonoike 1993, p. 97). This can result in serious corruption of kickbacks, and favoritism, and under the table bribery.

Third is the possibility of bid rigging, whereby a contractor is decided in advance and the other contractors agree not to underbid him. If contractors cooperate in such a scheme, they will surely profit from it in the end because eventually their turn will come to be chosen as a successful bidder. Bid rigging is difficult when there are many bidders, but in the case of a nominated system, the number of bidders is normally narrowed down to only five or six. Thus, the time and cost will be reduced (Tonoike 1996, pp. 164–165), but at the heavy expense of corruption and loss of trust in the government bidding system.

To overcome the problems of a nominated bidding system, reforms were undertaken in the 1990s, when it was urged that an open tender system be introduced in the local and central governments. The advantages of an open tender system are superior and as follows: First, it can prevent the corruption by politicians and public officers. Second, it can strengthen the contractors with competitive abilities. But, the disadvantage of an open tender system is the increase of the burdens of bureaucratic work to check whether the construction companies can meet the conditions for bidding, and there are some anxieties about dumping as a result of the competition among the construction companies. To address this possible weakness, a comprehensive bidding evaluation method, which evaluates the bidders from various standpoints such as quality, safety, and environmental impact in addition to the price, is used to determine the successful bidder (Act on Promoting Quality Assurance in Public Work, Article 3, Paragraph 2).

Basically, the successful bidders will be decided according to price competition. But, because the third clause of the Article 234 of the Local Autonomy Act stipulates "The contracts of local governments within their expenditure can contract with the companies that applied to the bidding with the lowest price below the predetermined price," the government can decide bidders not only by price, but also by using other criteria (Local Autonomy Act, Article 234, Paragraph 3, Enforcement Order of the Local Autonomy Act Article 167-10-2, Paragraph 1). Based on this Act, some local governments have introduced a comprehensive evaluation bidding system.

One of the institutions that has become the basis of bidding system reforms is the Act for Promoting Proper Tendering and Contracting of Public Works that was passed in November 2000 (Mita 2010, p. 90; Yokozeki 2009, p. 93).

This act determines the basic items for proper implementation of the bidding and contracting systems that the central government special corporation and local governments conduct, makes information available about the bidding and contracting of public works, establishes measures to prevent improper actions and measures to conclude contracts at proper prices and measures to create proper practices, and sets guidelines for this act. The purpose of this act is to obtain trust about public works from the people and to develop the construction industry that undertakes public works (Act for Promoting Proper Tendering and Contracting of Public Works, Article 1).

Another law related to the bid system reform is the Act on Promoting Quality Assurance in Public Works, which was passed in 2005. The comprehensive bidding evaluation method is based on this act. The thought behind this Act was that securing public works will contribute to realizing a fulfilling life, obtaining security, maintaining the environment, and forming autonomous and

affluent local societies, and will become a benefit to current and future generations, by improving high-quality social capital.

The purpose of this act is to attempt to promote the quality acquisition of current and future public works, to increase general welfare, and to contribute to sound development of the national economy. To realize these aims, this act defines fundamental issues such as the underlying ideas, the responsibilities of the central government, and the basic principles for quality assurance in public works that will promote the training and obtaining of contractors and promote quality assurance in public works. This legislation was a rare case of introduction by the Diet members and was mainly promoted by the "Federation of Diet members for Quality Assurance in Public Works" of the Liberal Democratic Party in Japan. It is important to note that most legislation is originated by the Cabinet in Japan that introduces parliamentary cabinet system (Chino 2016).

In addition, the Act on Elimination and Prevention of Involvement in Bid Rigging, and Punishments for Acts by Employees that Harm Fairness of Bidding, was enacted in 2002 and implemented in 2003 to prevent bid rigging by public officers. Then, this act was revised in 2007 and the penalties were strengthened. This act defines measures to exclude and prevent bid rigging actions and defines the penalties for obstructing the justice of bids. For example, the Fair-Trade Commission can request the chief of ministries and agencies to establish measures to remove involvement in such matters as bid rigging, to claim damage compensation from public officers who engaged in bid rigging, and to investigate the reasons for disciplinary actions against such public officers, and to cooperate among related officials (Act on Elimination and Prevention of Involvement in Bid Rigging, and Punishments for Acts by Employees that Harm Fairness of Bidding, Article 1).

## The Background of Bidding System Reforms and the Reform Results

The main aims for bidding system reforms are to prevent bid rigging and to use tax revenue efficiently and effectively, by implementation of public works at the proper prices. There were mainly two reasons for the bid reforms in the period from the late 1990s to the beginning of the 2000s.

During the 1980s and the 1990s, there were cases of corruption by politicians and construction companies concerning public works. In March 1993, Shin Kanemaru, who was vice president of the Liberal Democratic Party, was found guilty of tax evasion because he neglected to file his income tax return after receiving bribes from construction companies to interfere in the bidding for public works (Yomiuri Shinbun 1993; Mita 2010, p. 97). After this, the public became even more suspicious about public works. Related to the Kanemaru case, there were bribes given from each large construction company not only to Diet members, but also to local governors and mayors (including the mayor of Sendai and Miwamachi, and the governor of Ibaragi and Miyagi), which were revealed by the Tokyo public prosecutor's office (Asahi Shinbun 1993b; Mita 2010, p. 98). These scandals resulted in massive public criticisms, reaching a peak, and further distrust of the bidding and government officials and politicians doing corrupt businesses with private contracting companies.

It was thought that these cases of corruption were caused when construction companies approached politicians to ask for special treatment among the nominated companies in the bidding process and to leak the nominated price that was not open to the public. For these reasons, bidding system reform became imperative.

Second, in the US-Japan Structural Conference, the USA urged reforms of the bidding systems. The USA pointed out that Japanese bidding systems prevented American construction companies from entering the Japanese construction market. So, the US government asked the Japanese government to extend the scale and lower the price of introducing an open tender system to increase the opportunities for foreign companies to enter construction bids in Japan – and to respond to the complaint from the American corporations which could not enter into the Japanese

market (Asahi Shinbun 1993a; Mita 2010, p. 100).

As of 1994, the introduction of an open tender system was accomplished in all prefectures and ordinance-designated cities (special urbanized cities with metropolitan areas and large populations) and 11% of regular cities. The Ministry of Internal Affairs and Communications and the Ministry of Land Infrastructure and Transport and Tourism investigated the actual conditions of introducing reform of the tender system from 2001, which was after the law was enacted in 2000, to move ahead with the Act for Promoting Proper Tendering and Contracting for Public Works. As of the 2002 research, the introduction of an open tender system was accomplished in all prefectures and ordinance-designated cities and 28.6% of regular cities (Mlit 2002).

But even though all the prefectures introduced an open tender system, the price of application of an open tender system was high. Thus, many companies could not afford to participate in it. According to the public supply project team report, called The Project Team Report on Public Procurement, or The Progress of Public Procurement Reform in the Prefectures issued by the Nationwide Governors Association, and as of December 2006, only the prefectures of Yamagata, Miyagi, and Nagano had introduced open tender system with a minimum starting price of 10 million Yen. But the number of prefectures that introduced an open tender system increased after the Guideline of Prefecture for Public Procurement was presented by the Nationwide Governors Association, following the corruption that involved public works from October to December 2006 (National Governors' Association 2007).

After that, other municipalities that had not implemented the reform before introduced an open tender system. By 2017, the introduction of an open tender system was accomplished in all prefectures and ordinance-designated cities and about 68.6% of regular cities (Mlit 2017).

The tendency to reform in the bid system arose not only in the open tender system, but also in the bid system for promoting quality assurance. The Act on Promoting Quality Assurance in Public Works was legislated in 2005. As of 2006, the introduction of a comprehensive bidding evaluation method to promoting quality assurance was implemented in 10.6% of the prefectures, 6.7% of the ordinance-designated cities, and 0.3% of the municipalities. Then, as of 2017, the introduction of a comprehensive bidding evaluation method was implemented in 76.6% of the prefectures, 75.0% of the ordinance-designated cities, and 20.7% of the municipalities (Mlit 2017).

## Conclusion

Even though bidding system reforms have been implemented in order to realize transparency of the bid procedure and political factors, the rigged bidding will not entirely disappear. Even after Act on Elimination and Prevention of Involvement in Bid Rigging, and Punishments for Acts by Employees that Harm Fairness of Bidding, etc., was amended in 2007, the bid rigging by public officers has continued (Japan Fair Trade Commission Secretariat 2018, pp. 73–118). There is the possibility that bid rigging will occur not only in the nominated bidding system, but also in bidding for projects in which advanced technologies are required because only a few construction companies can join the bidding for such projects. Actually, rigged bidding for contracts related to Japan's first commercial high-speed magnetic levitation train line known as the Linear Chuo Shinkansen occurred in 2017. Prosecutors raided the offices of private general contractors Obayashi, Taisei, Shimizu, and Kajima for alleged antitrust violations. In 2005, these construction companies collectively pledged to the public that they would no longer engage in bid rigging activities (Asahi Shinbun 2018). Even though this bid rigging was not in public procurement and government contracting, it became evident that bid rigging would be difficult to eliminate completely, especially in big projects.

Even now, further system reforms are required in order to use the citizens' tax revenues properly and to prevent rigged bidding. The transparency in public works bidding procedures is an

important element in the reform, not only desired, but also essential and imperative.

# Japan's Bureaucracy in International Perspective

Naomi Aoki
Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore, Singapore

## Synonyms

Autonomous administration; Bureaucracy; Bureaucratic politics; Comparative public administration

## Definition

Selected institutional features of Japan's national bureaucracy highlighted and juxtaposed with those of other countries.

## Introduction

Scholars generally agree that the political influence of Japan's modern national bureaucracy is strong (Bowornwathana and Poocharoen 2010; Nakamura 2002). This cannot be said of all bureaucracies around the world, and countries can vary considerably in what makes their bureaucracy strong or weak. It is beyond the scope of this chapter to provide an exhaustive list of sources illustrating these variations or to comprehensively assess the extent to which Japan's bureaucracy is stronger or weaker than bureaucracies elsewhere. Instead, this chapter discusses selected institutional features which arguably contribute to the view that Japan's bureaucracy is rather strong. These features are juxtaposed with institutions in other countries to highlight their distinctiveness.

## Theories of Bureaucratic Influence

The political influence of a bureaucracy can be defined as "the extent to which administrative actors are able to shape the outcome of policy formulation and implementation in line with their interests" (Knill 1999, pp. 115–116). It is a relational concept that can be understood in terms of interactions between a bureaucracy and its surroundings. Bowornwathana and Poocharoen (2010) conceived the "Bureaucratic Politics Framework," which sees bureaucrats and politicians engaging in a power struggle, and the administrative reforms they pursue to expand their sphere of influence destabilizing the balance of power towards either "weak politicians and strong bureaucrats" or "strong politicians and weak bureaucrats." Bowornwathana and Poocharoen have identified political attempts to create "stronger politicians and weaker bureaucrats" in Italy, Japan, Thailand, and the United Kingdom (UK).

Knill (1999) observed that public administrations across countries differ with respect to three dimensions: (i) the *political influence of the bureaucracy*, (ii) the *strength of executive leadership*, or the degree to which political power is concentrated in the hands of the political executive, and (iii) *administrative entrenchment*, determined by "the extent to which administrative activity is based on legal and formal requirements" and by "the comprehensiveness and fragmentation of administrative structures" (p. 115). An *autonomous* administration features a combination of *low* executive dominance, a *high* degree of bureaucratic influence, and a *high* degree of administrative entrenchment, while an *instrumental* administration features the opposite combination. Executives in an autonomous administration find it more difficult to implement administrative reforms because there are more institutional vetos to block reforms, which are likely due to judicial checks, bureaucratic resistance, and structural complexity.

The aforesaid model focuses on what determines the reform capacity of political executives, and hence, requires modification to focus on bureaucratic influence. The model assumes bureaucrats are unwilling to support the executive. In this scenario, high administrative entrenchment acts as a check on executive actions, and this serves the interests of bureaucrats. Accordingly, from the executive's point of view, a *high* degree of political influence on the part of the bureaucracy and a *high* degree of administrative entrenchment together

make an administration autonomous. However, from the bureaucrats' point of view, a *high* degree of administrative entrenchment implies a *low* degree of political influence on their part, because administrative entrenchment acts as a check on bureaucratic actions. Hence, an administration that resists bureaucrats' efforts to implement policies and reforms features a *high* degree of administrative entrenchment, resulting in a *low* degree of political influence on the part of the bureaucracy, together with a *high* degree of executive dominance.

The degree of political influence wielded by a bureaucracy varies across countries. Knill (1999) argued that Germany has a strong bureaucracy, whereas Great Britain's Thatcher government weakened bureaucratic influence, which made its administration more instrumental – a view consistent with Bowornwathana and Poocharoen (2010). Painter (2004) observed shifts in the balance of power between bureaucrats and the executive in Malaysia and Taiwan. This happened in Thailand, too, when the Thaksin Government diminished bureaucratic power, whereas Singapore has maintained a strong executive leadership combined with "a career civil service subordinate and loyal to the government of the day" (Painter 2004, p. 370).

## The Bases for Japan's Strong Bureaucracy

The relatively strong influence of national bureaucracy in Japan has to do with the timing of bureaucratic modernization vis-à-vis democratization. During the Meiji Period, the bureaucracy was considered "autocratic" (Tsuji 2010, trans. by the author) because it was working for ministers who were not popularly elected and who directly advised the ultimate sovereign – the emperor. Popular elections for the House of Representatives had been introduced, but this Parliament was "an organ supporting the legislative power of the emperor" and "not the representative organ of the people" (Urabe 1990, p. 63). Free from popular control, the bureaucracy was able to build its sphere of influence before the current constitution came into effect in 1947 and made it accountable to the people. Although historical details vary, this sequence of bureaucratization before democratization is similar to how developments occurred in Germany, but it stands in contrast to the UK, where "a stable democratic system preceded administrative modernization" (Knill 1999, p. 129); this difference arguably contributed to creating stronger bureaucracy in Germany than in the UK (Knill 1999) – an argument that can also be used to explain Japan's strong bureaucracy. Japan's sequence contrasts with that of Singapore (Aoki 2015), where the elected government, upon taking office in 1959, effected from the outset an "attitudinal reform" (Quah 2013) of civil servants "in poor health" (Painter 2004, p. 371).

Behind the image of "strong bureaucrats and weak politicians" are so-called elite bureaucrats, who are recruited through a career-track exam formerly known as "Level I," followed by interviews. This examination is competitive, with an average passing rate of 5.4% from 1960 through 2014 (according to the author's calculations based on the National Personnel Authority (2015)) and with a large number of successful applicants who are law graduates of former imperial universities (Nakamura 2002), entry to which is also competitive. Schneider (1993) once reported on the proportion of elite bureaucrats from top universities in Japan (data as of 1986), which was higher than that of Mexico (1935–1976), Brazil (1964–1986), and the USA (1933–65). As far as recruitment is concerned, Japan's approach has been generally what Rosenbloom (1983) termed managerial rather than political; recruitment is by default merit-based, without formal measures of "promoting political pluralism or representation in civil service" (p. 221). Although recent initiatives to encourage gender representation in civil service under the Abe administrations are noteworthy, such initiatives are promotional rather than constitutionally mandated and subject to political will. Japan is different from a country like Nigeria, where prioritizing representation over "the tyranny of skills" was imperative due to ethnic tensions (Sowell 2004, p. 102) and where the principle of "federal character" had to be enshrined in its Constitution, such that the civil service should reflect the diversity of the nation.

The image of competent bureaucrats in Japan has been reinforced in part by the sight of ministers during diet sessions relegating questions to bureaucrats and citing their superiority (Akizuki 2010) and by the historical understanding that Ministry of International Trade and Industry bureaucrats contributed greatly to Japan's economic miracles (Johnson 1982).

Another factor that contributes to the image of "strong bureaucrats" is the fact that bureaucrats are working behind relatively closed doors, largely free from external control. Besides the competitive exam, entry to the civil service is limited because Japan's bureaucracy runs on a ranking system, unlike the UK's position-based recruitment system. The OECD (2008) rated Japan as the second lowest, next to France, among 26 OECD members in terms of its "openness index," which measures the extent to which civil service recruitment is open to external applicants. Compared to a situation like that in the USA, the number of political appointees who penetrate the Japanese ministries remains relatively small. Furthermore, the leeway for external experts to advise bureaucrats remains rather narrow. This is in contrast to the USA, where "presidents and presidential candidates have solicited the advice of policy experts, many recruited from prestigious academic think tanks, to help chart a course for America's future," and where think tanks have played pivotal roles in advising the bureaucrats (Abelson 1995). In contrast, Ueno (1998) observed that the use of think tanks was limited in Japan. Even today, the concerns in the USA about think tank influence on policy making are virtually absent. In Japan, career civil servants elude the control associated with mechanisms like performance-based promotion, too; despite some attempts to introduce skill and performance appraisals, promotion is largely based on seniority, dating from the year of entry into civil service. This system is unlike that in Singapore, where promotions have been based on performance and potential since the 1980s (Neo and Chen 2007) and in China, where performance management is used to reinforce civil servants' political loyalty to the Communist Party (Jing et al. 2015).

Within the Japanese government, there are some channels through which bureaucrats exert considerable influence on policy making. Although conducting the complex business of modern government requires some bureaucratic discretion everywhere, repeatedly identified as a unique feature of Japan's bureaucracy is a bottom-up policy process institutionalized under the long reign of the Liberal Democratic Party (LDP), combined with the roles of some LDP politicians who are known as *zokugiin* (Tsuji 2010). When the LDP held power, the bureaucrats and *zokugiin* set agendas, discussed, and rejected and preapproved policies before the drafts went to the Cabinet and were finally submitted to the Diet, where approval was likely due to the LDP majority. This system was somewhat disrupted when the Democratic Party of Japan government assumed office in 2009, but it has been resumed under the Abe administration (see Kamikawa (2013)). Another channel has been created by the appointment of career bureaucrats as Executive Administrative Secretaries to the Prime Minister, and their assistants – positions reserved for the Prime Minister's Office. These bureaucrats are customarily drawn from the Ministry of Foreign Affairs, the Ministry of Finance, the Ministry of Defense, the Ministry of the Economy, Trade and Industry (METI), and the National Police Agency. The fact that the current Abe administration has appointed two bureaucrats from METI suggests a relatively strong presence of METI in the Prime Minister's office.

While the bureaucracy is viewed as being strong, executive dominance remains relatively low, compared to a country like the USA, which boosts the relative strength of the bureaucracy in the polity. The Prime Minister is the head of the Cabinet under the current Constitution and is responsible for appointing his or her Cabinet members. Nevertheless, the Cabinet runs on the principle of collective responsibility, and its decisions follow the tradition of unanimous consensus (Nakamura 2012). This tradition, in theory, limits the authority of the Prime Minister more than in the US Presidential system, "where the president dominates the government, and exercises his influence in bilateral relations with individual departmental ministers" (Andeweg 2000, p. 380).

Japan's legalism adds administrative entrenchment to the mix, but its unitary structure makes administrative entrenchment lower than in a federal state like Germany. Urabe (1990) argued that the idea of the Rechtsstaat in nineteenth-century Germany under the monarchy, which Japan borrowed in its Meiji Constitution, was "no more than self-restraint of the state power" (p. 62), as only an administrative court could review administrative actions. The 1947 Constitution, however, protects individual rights and liberties, and with this Constitution, administrative action became "subject to the judicial review of the ordinary courts, and the superiority of the judiciary over the administrative bureaucracy is a constitutional principle" (Urabe 1990, p. 65), so that the Constitution strengthened the checks on bureaucratic action by the rule of law. Nevertheless, Japan's unitary state is different from a federal state like Germany, where bills "whose enforcement impinges on the organizational and administrative jurisdiction of the federal states" (Bundesrat n.d.) require consent from the Bundesrat – a legislative body that represents the Länder governments and serves as an additional veto point in federal decision making. Such an organ is nonexistent in Japan. The national bureaucrats, hence, escape an additional veto point that would otherwise have been in place should they promote policies serving their own interests.

## Conclusion

This chapter started by accepting the view that Japan's national bureaucracy is strong, and explored the reasons for why this is the case. The chapter highlighted how certain historical and institutional features of Japan's bureaucracy contribute to preserving the political influence of the bureaucracy, and these features appear distinct when they are juxtaposed with others in selected countries. In a relative sense, Japan's "strong bureaucracy" is also reinforced by weak executive dominance and administrative entrenchment, which are lower than those in a federal country like Germany despite its legalism.

# Japan's Mask Wearing Culture, Covid-19 Governance

Itoko Suzuki
United Nations Branch of Public Administration and Governance, United Nations Department of Economic and Social Affairs, Shizuoka, Japan

## Synonyms

Citizens' norms; Crisis management; Pandemic governance

## Definitions

Mask wearing is an inherent culture of Japan in reducing the risk of virus infection, which is associated with social norms to conform to the society.

The Covid-19 outbreak has become a pandemic disaster, for which all levels of governance – local, national, and global – must employ effective, equitable, and accountable management for the safety and security of all the citizens of the world.

## Introduction

Mask wearing appears to be a useful weapon in combatting the new coronavirus disease (COVID-19). And yet, mask wearing has been a vigorous social issue and even causing a political divide in the USA or a social divide in some European countries. Japanese people are accustomed for a long time to wearing a mask in winter to prevent catching a cold or virus infection, and more recently to prevent hay fever in spring.

WHO confirmed 35, 347, 404 infected and 1, 039, 406 deaths in its 02 October 2020 update of COVID-19; and that the actual number of the infected is estimated to be 10% of the entire world population. (https://www.who.int/dg/speeches/detail/who-director-general-s-opening)-remarks-at-the-media-briefing-on-covid-19%2D%2D-2-october-2020) COVID-19 can be compared to the Spanish flu that erupted in 1918. More than ten months have passed since this unknown virus infected and killed the people, impacting unprecedented social and economic losses (in Japan during in its first quarter alone, a decline of 28.8% of GDP is reported) in the world. Governments counter measures and risk management continue to unfold to defeat the epidemic in all parts of the world.

At this junction, this short essay tries to remark the mask wearing culture of the Japanese people which seems to have helped protect the citizens and hence minimize the infected cases and death tolls of this virus in Japan. The essay is a memoire of a lay elderly citizen who has lived in unrest like all others in the world since its outbreak, having deprived of a normal life such as meeting and eating with family members, or friends, going to the church or shrine, to the library, gym, sport

clubs, and traveling out of town, to name a few. All businesses, schools, public gathering in sports, music, art, entertainment, parks, and all the public spaces are closed for protection from virus infection. Many lost jobs and normal works and yet must continue to live in a so-called new normal with the protective measures and restriction in social and economic life. This essay is far from an academic argument. Nonetheless, it reflects upon the circumstances of the pandemic disaster governance of Japan in which citizens' mask wearing and associated social norms have played a part. COVID-19 is predicted to last a few years, without medications or vaccination available to all. Second or third surge like the previous Spanish flu pandemic is currently approaching. This pandemic is a peril to the humanity. All levels of governance, local, national, and international, must effectively, efficiently, and equitably manage this crisis until the recovery of normal life of all the people, and the economic decline in the world.

## What Is COVID-19? As Informed to the Citizens in Japan

### What Is COVID-19

According to WHO, COVID-19 is an infectious disease caused by a newly discovered coronavirus Most people infected with the COVID-19 virus will experience mild to moderate respiratory illness and recover without requiring special treatment. Older people and those with underlying medical problems like cardiovascular disease, diabetes, chronic respiratory disease, and cancer are more likely to develop serious illness. (https://www.who.int/health-topics/coronavirus#tab=tab_1dated 23 October 2020).

### How Japanese Citizens Initially Informed?

In Japan, the first news was on 1 January 2020 by the Yomiuri newspaper reporting a new type pneumonia in a short 13 line. WHO cited information reportedly conveyed by Chinese authorities on 11 and 12 January that 41 cases with novel coronavirus infection have been diagnosed in Wuhan city. The Japanese citizens learned through the media reports that the break is associated with exposures in one seafood market in Wuhan. Later citizens were informed of these 41 confirmed COVID-19 cases that ranged from 8 December 2019 to 2 January 2020. Thus, WHO's alarm to the world could have been in December and was often criticized as not quick enough.

On 30 January 2020, WHO announced 7834 confirmed cases, including 7736 in China, representing almost 99% of all reported cases worldwide, and 170 people have lost their lives in this outbreak (https://www.who.int/dg/speeches/detail/who-director-general-s-statement-on-ihr-emergency-committee-on-novel-coronavirus). Japanese citizens observed though the media dreadful scenes of patients lying in beds in the gym which was converted to a hospital. Japanese government dispatched chartered airplanes to Wuhan to retrieve Japanese citizens back home.

On 11 March 2020, WHO declared COVID-19 as pandemic informing that the number of cases of COVID-19 outside China has increased 13-fold, and the number of affected countries has tripled, and that more than 118,000 confirmed cases in 114 countries, with 4291 deaths. WHO suggested that without the vaccination, medications or supplies of the medical goods, and trained medical staff and hospitals as well as additional facility to accommodate patients, this explosive epidemic might require the lockdown of the area or entire country (WHO 2020). And all these actually happened and still happening as of November 2020 in many parts of the world.

### Information Disclosure from the Japanese Government to the Citizens

Information disclosure to the citizens from the government is a commonsense in a democracy, and such information must be accurate and useful for the citizens. Informed citizens can decide what to do for their safety and what the government should do. In Japan most of the citizens learn the news from the media such as TV and newspaper. Japanese government Ministry of Health Labor and Welfare (MHLW) announced on 25 February 2020 the basic measures of the new coronavirus control that have repeatedly reported in media and useful for citizens which are as follows: the new

**Japan's Mask Wearing Culture, Covid-19 Governance,**

Prevention Measures against Coronavirus Disease 2019 (COVID-19)

About COVID-19

< Common symptoms and risk of developing severe>

Often, fevers or respiratory symptoms may persist for around one week, and many patients complain of strong fatigue.

Those infected often present only mild symptoms, which will heal in many cases. The severity of the novel coronavirus disease is not as great as infectious diseases with extremely high mortality rates, but it does have the higher risk than seasonal influenza. The risks of developing severe symptoms are particularly high among the elderly and patients with underlying diseases.

<The routes of transmission>

The routes of transmission are generally through droplets and contacts. It is not thought to be caused by airborne infections.

In addition, under certain circumstances, such as when talking to many people at a short distance in confined spaces, there is the risk of spreading the infection even without coughing or sneezing.

Precautions in daily life

- First of all, washing hand is important. Wash your hands frequently with soap or alcohol when you return home, before or after cooking, before eating, etc.
- When you have symptoms such as coughs and sneezes, please cover your mouth and nose. If you cover coughs and sneezes with your hands and touches objects around you with those hands, there is a chance of spreading virus via those objects, please observe the "coughing etiquette".
- Seniors and persons with chronic diseases are advised to take extra precaution and avoid visiting packed places and using public transportation as much as possible.

Do not go to office or school, especially if you have symptoms such as fever.

If you have cold symptoms such as fever, measure and record fever everyday.

coronavirus disease is an infectious disease caused by a coronavirus called SARS-CoV-2. It mainly causes symptoms such as fever and/or cough. Polymerase chain reaction (PCR) tests may find out if one is infected or not. PCR is available to the citizens when symptoms of fever (government at first set 37.5 degree) continue for four days, then contact the public health center. Most of the infected have no symptoms and recover without knowing.

General protective measures for citizens, such as wearing a mask, social distancing, and washing hands were repeatedly conveyed through the media to the citizens (see COVID-19 diagram). MHLW alarmed the main commonalities of outbreaks that occur in (1) poor ventilation, (2) a space of people gathered closely together, and (3) a place of large numbers of people likely to come into contact (see to avoid 3Cs. diagram). Citizens and the public or event organized followed the Avoid 3Cs guidelines.

Additional government measures are organized from time to time to control the virus spread which are listed below and have been well informed to, and mostly taken positively by the citizens.

(a) A call for local governments for temporary closure of schools (b) A call for citizens to refrain from going out (c) Health system to deliver medical care, accept suspected patients at medical

**Japan's Mask Wearing Culture, Covid-19 Governance,**
**Fig 2** Public awareness campaign in Japan against COVID-19 (retrieved from https://www.mhlw.go.jp/content/3CS.pdf)

institutions, whereas patients with mild flu-like symptoms stay at home, or in a hotel the government prepared at its cost providing medical care. Appropriate medical care for the elderly and those with underlying disease, (d) Border control of entry restrictions and travel suspension to prevent infected persons traveling into Japan, (e) Request to ramp up production and smooth supply of masks, disinfectants, and medical treatment goods (as masks and disinfectants as well as toilet and kitchen papers have gone from the shops for a while after the initial outbreak in Japan, as well seen worldwide), (f) International cooperation to share knowledge obtained in Japan with other countries and WHO, etc.

## Mask Wearing Culture: Protecting from Virus Infection?

### What Is a Mask?

The meaning of a mask according to a dictionary includes veil, cover, gas mask, death mask fencing or baseball protective ware on face, etc. A variety

of uses dates back thousands of years such as Tutankhamen gold mask. Masks are those that cover part or all the face of the human body.

### Mask Wearing Associated with Other Cultural Heritage in Japan

Mask wearing is not originated in Japan. It is European origin. The original cloth mask is interestingly known to have been invented by Leonardo da Vinci in sixteenth century for sailors and is known to be made of a fine cloth. In Japan, at its Edo period (1603–1867) mask was used as the silver mine disease countermeasure. Mask was then seen at the infectious disease treatment clinics during later part of Japan's Westernization period (1868–1912). However, those days, wearing a mask was eccentric.

In Europe during the outbreak of the influenza in Spain (1918–1920), wearing a mask to prevent virus infection became widespread in a public space. It is estimated that 20 to 45 million people have died worldwide due to the Spanish flu. In comparison, about ten million people died in total during the World War I. In Japan 500,000 people died in the Spanish flu. With its outbreak in Japan in 1918, government ordered the citizens to wear a mask for protection from the epidemic.

The Spanish flu was widely known, as about a quarter of the world's population was infected at the time. Compare the WHO's October 2020 estimate which was 10% of the world population so far infected in the current pandemic Covid-19.

Mask wearing since the Spanish flu pandemic continued in Japan has been a social habit in cold season in winter and spring pollen season for protection of health. It appears mask wearing has not become habitual for citizens in the European states or the USA. Mask wearing for the citizens overseas in general and European countries or the USA seems to be rather weird, and in recent years mask wearing people were sometimes suspected as terrorists or anti-government demonstrators needing to conceal a face.

Japanese citizens' mask wearing habit coupled with the other social norms such as keeping some distance in greetings (usually bowing, no kisses no hugging), washing hands after returning home (even washing off bad lucks,), together with the Japanese people's tendency to live in concordance with others conforming to the "common sense" or majority's doing, have become the cultural heritages. These cultural heritages were convenient for the government at the time of national emergency declared to block the COVID-19 spread. Government used only request-based rules to the citizens to stay home, unless urgent, to the businesses to close, and to local governments to close schools and public spaces for about one month in April–May 2020 (See section "COVID-19 Outbreak Governance in Japan: In Retrospect") Majority of the Japanese followed the government requests of so-called lockdown at emergency.. Wear a mask rule together with the other preventive measures are listed in diagrams 1 and 2 described in the section "What Is COVID-19? As Informed to the Citizens in Japan", which have been well observed by most of the citizens. Those who did not wear a mask or did not comply with the rules have not been punished as the rules did not include any legal sanctions.

Interestingly, Japanese government, with the sudden strong urge of the Prime Minister Abe, when a mask became out of shop, tried to deliver by postal mail to each household a pack of two cotton cloth masks, with the government expenditures of 400 billion yen and through the already extremely busy local government offices. When reached to the household, it was too small for most of the Japanese, and no good quality, and masks were already back to the local shops.

### Mask Wearing Causing a Political Divide?

In sharp contrast to the mask wearing culture countries and areas like Japan, Korea, or Taiwan, for instance in the USA, it appears mask wearing has become a symbol of a political or social divide. In the USA its government Centers for Disease Control and Prevention (CDC) has strongly recommended mask wearing in public settings together with social distancing (https://www.cdc.gov/coronavirus/2019-ncov/prevent-getting-sick/cloth-face-cover-guidance.html taken on 25 October 2020). President Trump and his fans mostly ignored mask wearing or social distancing. Mask wearing became even a political divide in the 2020 election campaign in the USA.

(Or the political divide was causing mask wearing or not.) Soon after President Trump himself, his wife, and son, as well as some key White House staff were seen without wearing a mask nor keeping social distancing at the White House loan ceremony (https://www.who.int/countries/usa/) contracted with the virus, and making White House a cluster of COVID 19. In several European countries, many citizens after the lockdown was over and at the time attuned with in the summer vacation dashed to the beaches, parks, eating in restaurants open at last, or travelling. Most of them were seen not wearing a mask and ignoring social distancing. These social habits may have to some extent contributed causing the current third surge of COVID-19 in their areas as of early October 2020 (see section "COVID-19 Outbreak Governance in Japan: in Retrospect").

### Scientific Proof of Mask Wearing Effect

At the early period of this pandemic, people often questioned if a mask would help. WHO and medical professionals from the early stage widely recommended mask wearing for protecting from the virus. For instance, in January 2020, Dr David Carrington, St. George's,University of London, told BBC News that masks could help lower the risk of contracting a virus through the "splash" from a sneeze or a cough and provide some protection against hand-to-mouth transmission. Likewise, Prof. Conner Bamford, Queen's University Belfast encouraged washing hands to keep fingers clean and covering face with cloth or wearing masks.

Professor Yoshihiro Kawamoto, Tokyo University Medical Research Center, has suggested in his research result that the rate of swallowing when infected wearing a mask and noninfected not wearing a mask made of cotton is 20–40% compared to nonwearing mask cases. On the contrary, when infected not wearing a cotton mask, and non-infected wearing a cotton mask, 60–80% of inhalation of the virus. When infected not wearing mask, but uninfected wear a mask, 20–40% less inhalation. When both sides wear a cotton mask, virus inhalation rate was 30% compared to no wearing of both sides. Mask wearing is, in his conclusion, not a perfect solution only by itself, but still useful mechanism. Taking a social distance can be together used with the mask wearing to improve safety. (https://www.asahi.com/articles/ASNBP73F6NBPUBQU008.html).

## COVID-19 Outbreak Governance in Japan: In Retrospect

### Role Played by the Government

The fight to curb the spread of COVID-19 underscores the central role of government. As stated in the section "What is COVID-19? As informed to the citizens in Japan", Japan's health Ministry (MHLW) took several measures useful for protecting the citizens (MHLW 2020). In Japan there was no CDC like in the USA and the government created in February 2020 in the Cabinet Office a new professional consultation council headed by Dr. Shigeru Omi. It is an advisory body for the government to organize preventive policies and later in July 2020, with the inclusion of local government, private business sector, and labor union representatives, the body is used for the government to resume the economic activities while cubing the spread of the coronavirus (Cabinet Secretariat 2020). Cabinet Minister Yasushi Nishimura for Economic Revitalization was appointed in March 2020 as the Minister in charge of the revision of the Act on Special Measures against New Influenza and Other Measures. When the infection of the COVID-19 spreads widely, the law revision would enable to issue a "Declaration of National Emergency" that is required for such as self-restraint of going out and closing businesses. The government's response is often based on this law, and Mr. Nishimura is obviously inclined to economic recovery between safety of the citizens from the virus versus recovering economic loss.

In retrospect, major actions so far taken in 2020 by the government since the outbreak are as follows:

- 24 March, One-year delay of Tokyo Olympic and Paralympic
- 31 March, Expansion of disclosure of 73 countries and areas
- 7 April, Declaration of emergency to metropolitan cities due to the infected. Cases increased over 500 in one day

- 16 April, Expansion of emergency declaration to cover nationwide
- 14 May, Lifting emergency declaration in 39 prefectures
- 25 May, Lifting emergency declaration in all prefectures: the government policy shifted to the resumption of closed businesses
- 10 July, Allowing 50% and limit of 5000 people only in sports/events
- 22 July, Government Go to Travel policy started (till March 2021 with government incentive provision to users except for Tokyo, government expenditure of 1.1 trillion yen to cover
- 7 August, Newly infected number of one day exceeding 1600 per day
- 15 September, Go to Eat campaign to assist the restaurant and hotel businesses with government provision of incentive coupons to uses (till Jan. 2021)
- 1 October, Inclusion of Tokyo in Go to Travel campaign
- 29 October, Infectants confirmed reached 100, 000 (cumulative)
- 11 November, Dr. S. Omi, head of the Government Coronavirus Disease Consultation Council, alerted the new surge approaching in Japan as one day increase of 1543 infected confirmed. Dr. Toshio Nakagawa, chair of the Japan Medical Doctors Council announced the third surge of the Covid-19 in Japan, recommended economic resumption policy to be reconsidered. Government declined the medical professional advices.

### Role Played by the Citizens

It can be reiterated that in Japan, citizens have greatly helped the government in combatting the COVID-19. Japanese culture of mask wearing, social distancing, and living in conformity with others altogether helped from the explosive outbreak in Japan which are currently the case in many parts of the world.

### Citizens Concern Poor PCR Test and Associated Medical Capacities

One of the reasons of relatively low number of confirmed infected cases in Japan may be due to its lack of PCR test capacity. Citizens who are suspicious of their infection cannot take the test easily. For instance, Japan's neighbor, Republic of Korea which has a similar mask wearing culture, contributed to the world a good practice in combating the COVID -19 with its strong PCR capacity well linked to the necessary medical care, resulting low death rate. In Korea, for instance on 16 November 2020, 223 new confirmed cases (cumulative 28,769) with one death (cumulative 494) were registered. In comparison, on the same day in Japan, 1423 new confirmed cases, (cumulative: 117,749) with 1884 deaths were reported (https://www.mhlw.go.jp/stf/seisakunitsuite/bunya/0000164708_00079.html). Many citizens and the media kept criticizing that it is intentional of the government to minimize the PCR test, as the well-equipped hospitals for treatment of COVID-19 patients with the ECMO facilities (for serious symptoms needed) are in shortage from the beginning. Also lack of trained medical staff and facilities to conduct the PCR test was frequently reported in Japan.

Poor PCR exam capacities remain a problem in Japan after 10 months passed. Citizens kept urging the government to expand. Easy access to PCR test would enable many more citizens to go out. They wish to know they are not infected and would not infect others before going out. Citizens can help more the government to invigorate the resumed business activities and retrieve the serious economic loss.

## Conclusion: A Prospect of the Covid-19 Governance in the World

The second or third wave of infection has appeared to be three times stronger than the initial outbreak.

As shown in the above diagram as of 16 October 2020, the second or third surge of the Covid-19 has been assaulting in many parts of the world. Outbreak evolution of the current 10 most affected countries are the USA, India, Brazil, UK, Russia, Argentina, France, Italy. Belgium, and Czechia. Highest is the USA with 8,154,594 confirmed cases, and 219,674 deaths (https://coronavirus.jhu.edu/data/new-cases), Current surge is reported

**Japan's Mask Wearing Culture, Covid-19 Governance, Fig. 3** Comparison of COVID-19 confirmed cases among most affected countries, January-October 2020 (https://www.anzen.mofa.go.jp/covid19/graph_english.html.Japanese

over 3 times severer than during the first wave. French government declared curfew starting 5 November. The UK and some other European countries have been trying certain type of lockdown. Like the last century pandemic Spanish Flu, second, third, and more wave of Covid-19 may follow before its end.

Good news is a vaccination becoming available in the near future according to the vaccine developers Pfizer and Moderna. Possibly many others will follow. Safe vaccination will become a strong weapon to defeat the Covid-19 when it becomes available for all the people in the world.

Disaster governance must vigorously combat the pandemic with all actors involved, including national and local government, private sector businesses, and relevant nongovernmental and inter-governmental organizations working in cooperation. Above all, each citizen's commitment to mask wearing will become an important norm in the collective fight against this global public health challenge.

Citizens will be the stewards to hold our leaders accountable to the pandemic disaster governance. A mask will remain as a useful weapon for all until and even after the other stronger weapon becomes available. Wear a mask!

# Japan's Post-War Strategy for Industrial Expansion

Akira Nakamura
Graduate School of Governance Studies, Meiji University, Tokyo, Japan

## Synonyms

Degradation of environment; Economic growth; Government leadership; Olympic games and expositions; Public investment

## Definitions

Japanese government played a major role in the country's economic growth in the post-war period.

## Introduction

One of the major objectives of this section is to explore and delineate Japan's postwar economic strategy, while it also attempts to describe several shortcomings of this grand design. The architect of Japan's postwar growth was not leading industries in the country. The growth strategy was carefully engineered and crafted by the central government. The national government, instead of Toyota, Nissan, Toshiba, Panasonic, etc., spearheaded the country's growth machine. It was under the leadership of the Japanese government that the major industries in Japan had been able to remain in the leading edge of the world competitions.

Against these backgrounds, this section first explains a number of methods and approaches that the central government invented to foster Japan's economic growth after the war.

Particularly, the section focuses on the role and function of Japanese post offices, because they were instrumental in generating funds for the country's expansion. Likewise, the section also highlights the importance of the Olympics and Expositions in the postwar economy of the country. The government in Japan more often took advantage of these eye-catching international events and utilized them as an effective tool for enlarging the economic scale of the country. Finally, the section tries to shed some lights on a discouraging dimension to Japanese postwar expansion. The traditional and successful method of Japan's growth came increasingly to face an uncomfortable path. Beginning in 1977, Japanese economy encountered serious stagnation which still had been with the Japanese ever since.

## An Initial Strategy for Economic Growth: The Pacific-Belt Development

In the aftermath of World War II, the Japanese government felt a strong need for rebuilding the country from the ashes of war-torn economy. The country's growth strategy has been characterized by two distinctive features. The government dispensed a substantial volume of funds to prepare industrial infrastructures for leading manufactures; at the same time, the national authority also encouraged different enterprises to borrow funds from private financial institutions for their capital formations such as an installation of industrial robots and an erection of high tech factories. With these two essentials, the Japanese government placed various industries under its wings and spearheaded industrial development on their behalf. This growth plan was often branded as a "Convoy System": The government played a leading actor, while private firms served as supporting casts to diligently follow the public guidelines and regulations for their economic enlargement.

The government in Japan first initiated a growth action in 1955. It launched a development plan known as "The Pacific-Belt Expansion." The Pacific-Belt extending from Tokyo to a southern tip of the Kyushu Island, Fukuoka, had been the lifeline of Japan. The national government decided to pump public funds into this stretch of the region and attempted to construct huge industrial parks, *Kombinate*, one after another along the route. *Kombinate* is a Russian expression to stand for giant manufacturing grounds. Of many possibilities, why the Japanese government adopted this watchword has remained enigmatic.

In order to make space for the construction of *Kombinate*, beaches were often destroyed and rivers were frequently converted to speedways. One of the best examples indicating a bulldozer-like effect of *Kombinate* construction is evidenced in a long line of beaches by the Osaka Bay. Once they were all demolished, the government began gigantic landfill projects and prepared huge lots of space for various factory constructions. The area eventually came to be known as "The Sakai-Senboku *Kombinate,*' one of the most representative industrial sites in the country. The project in the Sakai-Senboku region has made available more than 2,000 ha (1 hectare equals to 2,471 acres) of open space. As of 2017, over 253 industries have built plants in the landfill area, while they have hired a total of 16,000 industrial workers, some of whom engage in refining petrol, while others produce steels and irons among other items.

Two issues need clarification at this point. The government could have built industrial zones on the other side of Japan, facing the Russian continent. However, this option was ruled out from the outset. During the 1950s and 1960s, the Soviet Union was not the market as far as the Japanese government was concerned. Russia was under socialist regime and would not be able to become Japan's business partner. The market was in the United States and the shortest cut to reach the American shores would be to have different manufacturing sites in the areas along the Pacific Ocean.

The second issue is about the financing of the national project. In tandem with the Pacific-Belt development, the government in Japan increasingly took advantage of post offices as a major source for the giant project finance. Japan had a total of 25,000 post offices around the country. Under the Japanese environments, these offices usually performed two different functions. First was a mailer function: people would be able to

purchase stamps or send packages as in many other countries. However, as far as the Japanese post offices were concerned, the mailer role stayed as a minor. They were assigned a more important role to perform. As a matter of fact, publics would be able to deposit savings in one of these post offices. They could also buy a life insurance, while they would likewise be able to ask for an auto-loan in a neighborhood post office.

So far as Japan was concerned, 25,000 post offices were financial institutions similar to any other commercial banks or insurance firms. For many years until the booming economy came to an end by 1997, the government had encouraged ordinary consumers to deposit money not in commercial banks but in one of the post offices. The latter normally provided a higher interest rate than that of other commercial outlets. The government and many Japanese people alike considered commercial banks to be for big industries; in fact, major banks contributed much to these enterprises and helped them to become one of the leading firms in the world market.

The money accumulated by way of post offices was so enormous that it was often dubbed as the second national budget. The first national budget stemmed from both individual and corporate income taxes. It reached more than 3,658 trillion yen by 1965. The amount was roughly equal to the volume of the post-office money. The difference between these two sources was that the national budget ought to have been screened by the national legislature. Quite to the contrary, the post-office money transferred to the Ministry of Finance and labeled as "government investment and loan funds" needed no such legislative scrutiny. The finance minister would be able to allocate the huge funds mostly to leading semi-government enterprises such as the Japan Highway Corporation and helped the organization to expand a speedway network of the country. In 1965, the finance minister extended the investment and loan funds to a sum of 48 semi-public agencies. They were busy taking different public-works projects essentially for industrial development.

## The Use of the Olympic Games as a Means for Economic Growth

Japan became the first Asian country to host the Olympic Games in 1964. In accommodating the games, the Japanese government initiated different projects to remake Tokyo one of the major metropolises in the world. Take speedways, for instance. Unlike USA or Germany, the country did not own a single line of freeway until 1964. In the same year, the first highway in the country extended from Osaka to Nagoya, *Meishin Freeway,* came into being. This was later extended to Tokyo with a label of "Tomei Speedway." Likewise, the government similarly tried to introduce a bullet train (*Shin Kansen*) connecting Tokyo to Osaka, a distance of more than 500 kms, approximately in 3 h. In a same fashion, networks of the subways and monorails were constructed in and around Tokyo, all in anticipation of the Olympic Games.

For these massive projects, the Japanese government was not reluctant to utilize the investment and loan funds. The "post-office moneys" were the financial backdrops of the country's enormous public works projects. They all aimed at making the Tokyo Olympics as one of the most successful games in history. The funds facilitated the country to provide bullet trains and monorails, in addition to the webs of highways and subways. As these examples indicate, the Japanese government remained shrewd in taking advantage of the Olympics. It exploited the games as a major vehicle to expand the size of the country's economy. The approach was highly successful to the extent that, by 1968, Japan became the second largest economy in the world.

After Tokyo, the Japanese government shifted the eyes to Osaka and decided to hold the Expo in 1970 in this second largest commercial city in Japan. The exposition lasted for 183 days from March 15 to September 13 in 1970. During the period, more than 64 million people visited the event. This marked the Osaka Expo to have the largest visitors and the most profitable project in Expo's antiquity. Once again, the government in Japan took advantage of this international occasion and utilized it as a means of the rapid increase of economy. The various records that the Osaka

Expo marked in 1970 remained true until the Shanghai event in 2010.

In addition to the public strategy for growth, the Japanese government encouraged the private sector to take a similar approach to enlarge the size of the country's economic scale. Private firms ordinarily have two different capitals: own assets (equity) and borrowed funds (liability). In a regular situation, equity accounts 60% for the resources of a company, while liability 40% of the total. In a country such as in the USA, a substantial number of individuals form a majority of stockholders in different firms. These stakeholders, more often retired populations, expect handsome dividends from the corporation. In order to generate profitable shares, the enterprise ought to keep the equity portion of the capital constantly larger than that of the liability. If the ratio turns the other way around, no dividends will be forthcoming and unhappy stockholders start criticizing the managing board of the firm. Shareholders' meeting will last for a few days, if not a week, as a consequence.

The situation in Japan looks fundamentally different from that in other countries. Japanese private firms have been noted for the shortage of equity. They are also notorious for collecting an excessive volume of liability. The equity and liability ratio in Japan's private companies would frequently become 20% and 80%, respectively. This would make many Japanese firms falling deeply in debt. And yet they are not normally declared bankrupt for a number of reasons. Above all, this has been the government policy. Among many other agencies, the Ministry of International Trade and Industry, renamed to the current Ministry of Economy, Trade and Industry, or METI, in 2001, was one of the proponents for investment-oriented growth strategy. It tried to stimulate private firms to borrow various funds from financial institutions.

Once the borrowed capital was put in place, corporations would then begin to invest monies in different types of capital formations. They would introduce industrial robots to their manufacturing operation, while the funds would also be expensed to build modern factories. This has been regarded as the best means to improve productivity and efficiency of various manufacturers. If one goes to a steel making plant in Japan, one will be surprised to find only a scattered number of workers involved in the operation. Instead of human hands, industrial robots are diligently and continuously working to produce autos and other durable goods with excellent quality. Eventually, such Japanese manufactures as Toyota and Panasonic began to raise their international reputations and to occupy the leading edge in the international market place.

## Transformation from Monopoly Capitalism to Horizontal Groupings of Industries

Under the Japanese business climate, whenever a private firm secures funds from financial institutions, two different features will set in. Both often indicate sustenance of the prewar legacy of the country's economic structure. Prior to WWII, the Japanese economy had been monopolized by a group of holding companies owned by a limited number of families. One of the examples was the Iwasaki Families. They controlled Mitsubishi Holding which reigned over approximately 120 different enterprises. Most of these firms carried the "Mitsubishi" label in some portion of their names as exemplified by Mitsubishi Real Estate or Mitsubishi Trading. The monopoly capitals called "Zaibatsu" were, however, dissolved in 1946 as a part of the American initiative to democratize Japan. Subsequently, the affiliated firms with Mitsubishi became independent, while the parent holding company was liquidated under the order of the US occupation forces.

Nevertheless, once Japan regained the sovereignty back in 1952, a horde of enterprises formerly under the monopoly capitals began to align themselves and started a new horizontal grouping of various firms. One of the best indications is a formation of "Mitsubishi Group" in 1954. The group is named "Friday Assembly," with which a total of 28 firms are associated. The presidents of these Mitsubishi companies meet once a month on Friday and share breakfast together. While eating, they frequently exchange business information so as to maximize economic gains of the association as a whole. The leader of this organization is more often the president of Mitsubishi Bank, which is

the pillar of this tightly knit assembly. When Mitsubishi Auto needs funds to enlarge business chances, the auto-maker will, first and foremost, ask Mitsubishi Bank to extend finances. In different monetary credits and loans, Japan's traditional monopoly legacy frequently surfaces. It highlights the survival of vibrant cozy business connections among leading private enterprises under the former capitalist names.

In Japan's business settings, a firm submits its own stocks or real estates as collateral to lending organizations. Especially, land property is historically valued more than any other items. Financial institutions will probably become willing to lend money, if an enterprise forwards real estates as a mortgage. Perhaps incomparable to any other countries, this business heritage has generated a significant outlook to Japan's social life. Because real estate is exceedingly appreciated in monetary transactions, the price of different properties often goes out of control: Frenzy land speculation repeatedly develops to be an important part of the Japanese economy. It is neither unique nor exceptional when 1 $m^2$ of a lot in downtown Tokyo is tagged at USD $100,000. Land price explosion will help some speculators amass a fortune, although it contributes little to the health of the country's growth structure.

Another feature integral to Japan's postwar economic expansion is a system of cross-holding of stocks among affiliated enterprises. In the Japanese business milieus, a private firm is allowed to expense 5% of the total asset for cross-holding of shares among other associated companies. This practice is especially noticeable between and among the former monopoly capitals. In Mitsubishi Auto, for example, a small portion of capital is utilized to keep the stocks of Mitsubishi Chemical, Mitsubishi Real Estate, Mitsubishi Cement, etc. In 1988, this business pattern reached the peak when more than 50% of stock exchanged was among varieties of companies with a cross-holding purpose. The ratio has subsequently been reduced to the current 10% of the total market value.

The end result of the cross-holding practice has been that, in Japan, a group of friendly private firms usually take a lion's share of stocks of a leading firm, while individuals spare only a fraction of the total. This pattern induces an important dimension to Japan's business tradition. For many years, when a private firm held an annual stockholders' meeting, it would last only 15 min at best. At the conference, individual shareholders were discouraged to speak up. The firm rehearsed a yearly meeting a day or two before the show. On the day of meeting, the firm mobilized young fresh employees to sit in the front row at the venue of meeting and prevented individuals from raising issues from the floor. Various important agendas had all been discussed and resolved between the host firm and the friendly allying enterprises long before the meeting started.

Under these circumstances, the policy direction of managing board of enterprise would not be questioned. Instead, the board could submit varieties of aggressive capital investment proposals to the stockholders, a majority of whom would most probably be affiliated financial firms. Similarly, these shareholders would raise little or no objection to the firm, even when it would fall in debt. The leading institutions would in fact be happy to extend loans to the enterprise. One of the reasons was that both prices of stocks and land properties of the debtor had kept rising ever since 1945. Banks and other lending institutions enjoyed attractive dividends and, in the event that something would go wrong, they could sell these mortgages and avoid the bad loans.

In this fashion, both stocks and land properties had worked as a safeguard for lending organizations. They would use these items as a hedge against ups and downs of Japan's economic prospects. This investment mechanism which had been the bedrock of Japan's postwar economic expansion had effectively functioned until the mid-1990s. Before the traditional form of business management became busted, a list of success stories of Japanese enterprises was often covered by the media in the USA and elsewhere. Some of them were offensive especially to the Americans: The Rockefeller Center and Tiffany in New York, an epitome of American capitalism and prides, were bought out by Japan's Mitsubishi Real Estate and Tobu Department Store, respectively.

## The Failures and Plummeting of Japan's Postwar Growth Strategy

The Japanese enjoyed a brief period of unprecedented economic growth. For the 5 year period from 1986 to 1991, the country experienced a bubble economy with spiraling land prices and extensive consumer spending. One of the compelling reasons for this unfamiliar expansion lied in various industries to have gained substantial sales and profits overseas. They brought these proceeds back to the country and contributed to an oversupply of yen in the domestic market. A large number of private enterprises began to utilize these abundant yens to invest in real properties and stocks of numerous firms. Eventually, the values of both shares and properties soared to the point that 1 $m^2$ of land in Tokyo was often priced more than 10 million yen or USD $100,000.

This was one of the end results of Japan's growth strategy. It had excessively been geared towards capital investments, which helped different Japanese industries to remain in a leading edge of international competition; however, this growth orientation also produced several negative effects, one of which was the rise of overheated economy. During 5 years, in addition to the soring land and stock values, consumer spending likewise went out of control. Many entertainment areas were filled with customers with easy monies. The bubble economy was a strange and frantic period that no Japanese had ever experienced in the history of the country.

Nevertheless, the perplexing period came to a sudden stop in the early 1990s. Among many reasons, one of the most critical was a change in the government policy orientation. In order to bring the hysterical economy back to normalcy, the central government in keeping close coordination with the Bank of Japan introduced a new tax measure, Land Value Tax, in 1992. With this new tax measure, financial institutions began tightening lending policies, while banks raised interest rates to discourage private firms and individuals to purchase different properties. Fortunately, the new programs brought forth an immediate effect. As if pouring cold water over a heated bucket, the prices of both land values and stocks instantly started to plunge and the bubble economy looked by all means busted by 1997.

In the same year, one of the leading financial firms, Yamaichi Securities, became insolvent, while Hokkaido Takushoku Bank, the largest financial institution in the northern part of the country, went broke. This was followed by yet another bankruptcy of the Long Term Credit Bank. Unfortunately, the impacts of the land tax and other measures did not stop in these cases: The effects moved further and hit the entire outlook of Japanese economy. It started to curve down more than originally anticipated. In retrospect, the year 1992 when the new tax was put in place marked the beginning of depression that Japan had to bear for over 20 years. The sinking economy penetrated deep into different corners of Japanese society. In congruent with the economic downturn, for instance, the rate of employment in Japan started to move upward to 4% in 1998, while it moved further still to more than 5% by 2001. This meant that over 3.6 million workers lost their jobs, which was highly unusual and unparalleled except a few years right after the way.

During these depressing periods, once acclaimed Japanese growth model became the target of international criticisms. Instead, an introduction of American model which stressed a strong market orientation with little or no government intervention seemed to be valued even in Japan. Consequently, a high incident of mergers and acquisitions among private enterprises grew popular, while such labor practices as a seniority system and life time employment were dwindled away. The bust of the country's economy induced the loss of confidence and the discrediting of investment-oriented approach to the economic growth in Japan. The Japanese had to wait for over 20 years before they once again regained self-assurance and began to witness the rise of Japan's business operation.

In the meantime, the role and function of government have also started to alter. Increasingly, the government has no longer meddled in business affairs as once ware; instead, the central authority has revered private firms to take a lead in development and growth strategies. In fact, a large number of private firms have decided to go global

and moved their operations to other countries. This "off-shore approach" has in effect reduced the dominating role of Japanese government in commerce and business issues. Eventually, the Japanese economy has entered into a new era as soon as Abe Shinzo became the prime minister in 2012. Under the Abe administration, the country's economic performance has picked up once again and become robust and vibrant as was the case a half century ago. Nobody knows for sure how long the "Abenomics" would last and introduce substantial changes to Japanese politicoeconomic outlook for good.

## Concluding Remarks

In concluding this section, the paper should point to one of the most critical issues the Japanese experienced during the period of rapid economic growth. This should perhaps become a good lesson for those countries currently undergoing economic expansion. However successful, the postwar economic recovery of Japan brought with it a number of untoward side effects. One of the most serious was pollution. Concomitant with the economic growth, the Japanese increasingly came to face declining qualities of air and water especially during the 1960s and the early 1970s.

Among many, the "Minamata Mercury Poison Incident" seems worthy of noting, since it was the tragic and mind-boggling accident that should not have happened. The case dealt with water pollution. In this instance, a leading chemical company built a plant close to a fishing village, Minamata, in the Kyushu Island, long before the war in the 1930s. The manufacturer produced a biological compound called "acetic aldehyde" to be used for producing plastic materials. In the production process, the firm continuously disposed huge volumes of mercury to the ocean. This generated a chain of devastating reactions. Fishermen in the village caught fish in the contaminated ocean, which was later consumed by the village people.

At the end of the day, those who took the polluted fish over the years began to disclose horrifying outcomes. The victims began to lose sense of body balance, while their eyesight started to decline. Likewise, they saw their body slowly paralyzed and soon came to the end of their lives. The first victim of Minamata appeared in 1953, but the number of the victims had continued rising ever since. By 2009, a total of about 1,500 village populations were declared to have been killed by the Minamata mercury, while over 32,000 have been labeled as the sufferers of the incident. Many cases of law suits and class action trials were ensued until 2009 when the government finally enacted a specific law to compensate for the victims of this disastrous event. In terms of desolation and human agony, the Minamata Mercury Incident ought to be remembered and served as one of the most tragic precedents that the rapid economic expansion would often generate.

Decade long and nationwide pollution came to be subsided by the late 1970s for a number of reasons. First, the national legislature took the issue seriously and decided to enact a total of 18 laws to manage pollution in 1970. In addition, the Supreme Court played a positive role in controlling the high incidence of environmental degradation. The court handed down several landmark verdicts to help the victims back on the track. The judiciary also punished the perpetrator of the Minamata and several other similar cases. Finally, many ordinary publics fearful of the rise of environmental degradation came together to organize resident movements. These antipollution movements soon developed to be strong anti-big business campaigns and facilitated to entrench the "Pay Polluters Principle" in the country.

These Japanese experiences provide the excellent lessons for those democracies which are presently going through the period of rapid economic growth. These developing countries should keep the Minamata issue in mind and try to avoid, whenever possible, the degradation of their living surroundings. Once harm is done to environment, it will take years of endless efforts to bring polluted environments back to normalcy. In 2015, the United Nations put a new agenda, "Sustainable Development Goals," as a rallying point for many member states to follow. Before SDGs to be realized, it is critical that the participants in the UN project should all be familiar with Japan's heartbreaking history of various types of pollution.

SDGS seem intrinsic to and inexplicable from the lessons the Japanese learned a few decades ago in a hard way.

## Synonyms

The Japanese bureaucracy; The Japanese central government; The Japanese government ministries

## Definition

The administrative organizations that constitute the Japanese central government and the institutions that define the conditions for recruitment and promotion of its employees.

## Introduction

There was a time when the Japanese bureaucracy attracted considerable interest, especially among Western scholars. At the height of Japan's economic prosperity in the 1980s, numerous books and articles praised the civil service for engineering a "Japanese Miracle" after World War II. A consensus formed around the view that the institutional autonomy of the Japanese bureaucracy allowed it to formulate coherent economic policies, which in turn led to rapid industrial development (Johnson 1982; Pempel and Muramatsu 1995).

For two reasons, this literature has now become largely obsolete. First, Japan's civil servants no longer enjoy the prestige that they have once been known for. After the Japanese economy entered a long period of stagnation in the 1990s, the civil service came under intense public criticism, leading to a series of reforms that curtailed its autonomy. During this period, Japanese scholars have produced a number of important studies that have presented new perspectives on the civil service. Second, there is a serious shortage of works in the English language that cover these latest developments. In fact, it was precisely during this period of economic stagnation that the international academic community lost interest in the events taking place in Japan.

The aim of this article is to fill this gap. It begins with a historical overview of Japan's civil service up to World War II, focusing on the development of institutions that defined the conditions for recruitment and promotion of employees in the central government ministries. It then shows the main features of the postwar civil service, and discusses the consequences of reforms since the 1990s.

## Historical Origins

Any attempt to explain the features of Japan's civil service requires some historical knowledge. Until the middle of the nineteenth century, Japan was governed by the Tokugawa government in Edo, under which hundreds of feudal lords (*Daimyo*) administered their own domains (*han*). During this period, government positions were distributed and inherited almost exclusively by the warrior caste (*samurai*). By the end of the

century, however, many of them were replaced by civil servants who were selected through competitive examinations. Considering the non-Western origin of the Japanese state, scholars have frequently remarked how Max Weber's "rational-legal" bureaucracy arrived at a surprisingly early stage of its history (Silberman 1993). Although Japan's defeat in World War II led to a comprehensive reform of this prewar civil service during the American occupation period, many of its features remain today.

The event that led to the establishment of the civil service was the Meiji Restoration in 1868, when the Tokugawa government was overthrown by a number of powerful feudal dominions in a military coup. The military leaders of the new regime, mostly coming from the lower samurai of these dominions, renamed Edo as Tokyo, and created a monarchical government with the Emperor Meiji as the nominal head of state. Initially, the dominions that overthrew the Tokugawa regime also provided most of the key personnel for the Meiji government, while many of the lower level officials that worked for the Tokugawa government simply transferred to the new government. However, the leaders of the Meiji government soon decided to abolish this patrimonial system, and chose to import Western institutions. The first examinations for the civil service were held in 1887, and the basic framework was completed by 1893. This process began before the enactment of the Imperial Constitution in 1889 and the first Imperial Diet Election in 1890. The power to establish the rules for recruitment and promotion in the prewar civil service was imperial prerogative, making it difficult for the legislature to control the bureaucracy.

This prewar civil service (bureaucratic *Kanriseido*) gave a significant advantage to a small number of elite bureaucrats. Those who passed the Higher Civil Service Examination were given exclusive access to the top positions with a lucrative salary. They were expected to become generalists, and the examinations focused on legal knowledge rather than technical skills. The graduates of the Faculty of Law at the Imperial University of Tokyo were given the top priority. In contrast, those who passed the Ordinary Civil Service Examinations were hired as subordinates to the elite civil servants, and had limited prospects for promotion.

There are two explanations for this elite privilege in the prewar civil service. According to a traditional interpretation, the Meiji oligarchs designed the civil service in order to prevent democratization. By making it difficult for political parties to gain access to the top administrative posts, they secured their own power. Despite its Weberian features, an elitist civil service that was based on imperial prerogative was more like a patrimonial bureaucracy in the era of European absolutist states (Tsuji 1969). However, a newer interpretation challenges this view. According to this account, the civil service was an organization that was much more open to outsiders than a system in which a small number of powerful dominions monopolized the recruitment of the personnel. By opening government to whomever passed the Higher Civil Service Examination, the rulers hoped to attract the best talent among the youth (Shimizu 2013). The difference between these two explanations is based on how they interpret the goals of the Meiji oligarchs. The former emphasizes their struggle to thwart the opposition, while the latter focuses more on their effort to build a state that could rival the Western powers.

It is worth mentioning that the civil service examinations covered only a fraction of the government employees. First, within the civil service, government scientists and engineers were hired directly from imperial universities without competitive examinations. In contrast to the administrative officials (*Jimukan*), these technical officials (*Gikan*) had relatively low prestige, with fewer prospects for promotion. Second, temporary workers were placed below the civil servants. Administrative assistants (*Koin*) and manual laborers (*Yonin*) were hired by each ministry on a temporary basis within their annual budget, and the pay levels were extremely low. These workers included a large number of women, who were barred from taking the civil service examinations.

Subsequent attempts to reform the civil service before World War II came from two major directions. First, political parties increasingly made use of political appointments. As they gained strength

in the Imperial Diet between the 1890s and the 1920s, they invented a strategy of replacing the top civil service posts with their partisans, with the aim of diverting government funds to their own supporters. However, this strategy faced charges of corruption, and died down after the rise of militarism in the 1930s. Second, technical officials demanded the improvement of their status. In the wake of World War I, they argued that their technical knowledge had become indispensable, but their demands never led to comprehensive reforms. While the military emphasized the role of science and technology after they took power, technical officials continued to be placed in an inferior status.

It was Japan's defeat in World War II in 1945 and the subsequent occupation by the United States that led to the comprehensive reform of the civil service. The general headquarters (GHQ) of the allied occupation forces chose a strategy of indirect rule, leaving the civil service largely intact. On the other hand, the GHQ officials soon set out to remove the elitist elements in the civil service, culminating in the new National Public Service Act of 1947 and 1948.

The centerpiece of this reform was the establishment of the National Personnel Authority (NPA), an independent agency modeled upon the United States Civil Service Commission. The NPA was to oversee the hiring and promotion of all central government employees under a single legal framework, including the technical officials and the former temporary workers who were now to be recruited through civil service examinations. Its main goal was to remove the privileged status of the prewar elite civil servants, and introduce job classification (*shokkaisei*), a system widely used in the American civil service. With job classification, government positions will be based on the expertise of each official, not whether the official passed a difficult examination in the past. Furthermore, the NPA was given the authority to set the pay levels for the civil service, replacing the role of collective bargaining that had been spreading across postwar Japan. Instead of the elite bureaucrats who dominated the prewar civil service, or the labor unions that were perceived to be under the influence of the communists, the experts at the NPA will be in charge of the recruitment and promotion of civil servants. The reformers in the GHQ expected that the NPA will establish a "scientific" personnel management system in Japanese government.

## The Postwar Civil Service

In the world of public administration, reforms never turn out the way they are intended to, and Japan's postwar civil service was no exception. After the end of the American occupation in 1952, it became clear that the Japanese bureaucracy would retain many of the features of the prewar bureaucracy that the occupiers had sought to replace. After the Liberal Democratic Party (LDP) came to power in 1955, it built a one-party dominant regime for the next several decades, and the civil service established a stable pattern of recruitment and promotion under its rule. This section lays out the basic outlines of Japan's postwar civil service which remains more or less intact today.

### Recruitment

Japan's civil service is a career-based (closed) system. Like the French civil service, the civil servants are recruited into the lowest level, and the upper-level positions are almost exclusively filled by promoting these lower-level officials. In the postwar period, civil service examinations now covered all categories of employees, including the technical officials and the former temporary workers. Lateral entry has been limited to positions that require expertise, such as mid-career doctors hired as technical officials. This is in contrast to countries with position-based (open) systems such as the United States or Sweden, where positions are competitively filled by individuals based on the qualifications for their task.

Despite the reforms during the postwar occupation period, the elitist institutions of Japan's civil service survived to become the so-called "Career System," which is equivalent to the British fast stream system. Until recent years, civil servants have been divided into two groups, with

a small number of "Career Bureaucrats" who had passed the "Type I" examinations, and a large number of "Non-Career Bureaucrats" who had passed the "Type II" and "Type III" examinations. This distinction based on the type of examinations roughly corresponded with the Higher and Ordinary civil service examinations in the prewar era. While this divide did not have a basis in the National Public Service Act, the Career System continued to be the foundation of Japan's civil service. Throughout the postwar period, the University of Tokyo has continued to supply the bulk of the Career Bureaucrats, especially for the most privileged ministries such as the Ministry of Finance (MOF) and the Ministry of Economy, Trade, and Industry (METI).

In general, civil servants are strongly attached to the ministry that hired them, instead of the civil service as a whole. While the NPA is in charge of civil service examinations, it is the ministries that choose their new recruits. The NPA examination consists of a written component and an interview, and those who have passed this first stage will proceed to the interview at each ministry. Throughout their careers, civil servants are occasionally transferred to other departments or local governments for a few years, but their career is controlled by their home ministry.

However, this was not always the case. During the period leading up to World War II, and during the reform era in the 1940s, many Higher Civil Servants spent a significant duration of their careers in newly established agencies in charge of the coordination and planning of economic policies. Because they worked together with officials from various other ministries, these civil servants did not necessarily identify themselves as a member of a single agency, even after they went back to their own ministry and reached the top positions. It was after the postwar reforms settled down and Japan entered a period of high-speed growth, that this practice largely disappeared and the civil servants began to spend their careers almost exclusively within their ministries (Makihara 2003).

Japan's civil service is also a career-based system in the sense that there is very little room for political appointments. Interestingly, the American reformers placed a strong limit on political appointments, despite its extensive use in the American civil service. The GHQ cared more about preventing the spread of the spoils system in the Japanese bureaucracy than producing an exact copy of the American government. Political appointments during the prewar period were already notorious among the Japanese, and the Americans did not prefer it either. A small number of positions are filled mostly by junior politicians from the ruling party, but they play no more than a minor role in the policymaking process (Izumo 2014).

### Promotion

Under the Career System, the fortunes of Career Bureaucrats and the Non-Career Bureaucrats sharply diverge at an early stage. According to Inatsugu (1996), the criteria of promotion for these two groups in the civil service are based on a combination of seniority and performance. The Career Bureaucrats are promoted by seniority at the same pace with their cohort members, and they all typically make their way up to the level of section chief by their forties. At this point, the best performers are promoted to the level of bureau chief (or director general), and then to vice minister. The others move out of the civil service and begin a second career in the private sector. In contrast, the Non-Career Bureaucrats are seldom promoted beyond the level of section chief (or director), and they tend to stay employed in their ministries until the legal age of retirement.

The Career and Non-Career Bureaucrats also experience a different range of tasks. While Career Bureaucrats are treated as generalists and transfer between multiple bureaus, the Non-Career Bureaucrats are mostly promoted within their own bureaus, because they are expected to be specialists in certain policy domains. The higher status of generalists is in contrast to countries with position-based systems, where public officials are treated as specialists for their tasks.

In theory, the privileged position of Career Bureaucrats would have been eliminated if the American job classification system was introduced

as originally planned during the occupation period. If each government position was to be filled by individuals who had the required expertise, civil servants would no longer be able to be promoted simply by seniority or by their elite status. The problem was that the plan was never implemented. When the NPA began its preparations, other ministries immediately rejected its proposal. Since job classification assumed an American-style, position-based system, it had a bad fit with Japan's career-based system. The ministries argued that their tasks were too complex to fit into a rigid classification scheme, and remained committed to their own systems of internal promotion. By the 1960s, the NPA had given up on its attempts (Kawate 2005).

In addition to Non-Career Bureaucrats, two other groups have a relatively inferior status. First, the Career technical officials are hired as specialists, and spend much of their career in a single bureau or specific policy field. While the technical officials in the postwar era have been promoted to the level of bureau chiefs, and have even become vice ministers in the Ministry of Land, Transportation, and Infrastructure (MLIT), their careers differ significantly from administrative officials (Fujita 2008). Second, women have almost no presence in the senior levels of the civil service (Sakamoto 2006). Interestingly, they have also been treated as specialists to a certain extent. At least until the 1980s, female Career Bureaucrats were recruited and promoted almost exclusively within the Women and Minors Bureau in the Ministry of Labor (now part of Ministry of Health, Labor, and Welfare). The GHQ modeled this bureau upon the United States Women's Bureau, and it was the only bureau in the Japanese government to be headed by a female civil servant (Kobayashi 2004).

### Pay and Benefits

In contrast to its failure in introducing the classification system, the NPA has played a central role in determining the pay and benefits for the civil servants. Compared to other advanced industrial countries, Japan's civil servants are granted a limited range of labor rights, with neither the right to strike nor to conclude collective wage agreements. In exchange for this lack of legal protection, the NPA has conducted a survey of private companies each spring, and has made recommendations to the government so that each civil servant received a wage that was comparable to the private sector employees at a similar rank. Throughout the postwar period, the government has largely complied with the NPA Remuneration Recommendation (*Jinjiin-Kankoku*) announced each August.

The survival of the NPA after the end of the American occupation period is an accident of history. When the GHQ established the NPA, its aim was to contain the wage militancy of the newly created labor unions. However, as Japan's labor unions lost their organizational strength with the onset of the cold war, they increasingly began to see the NPA as a lesser evil. When the Americans left Japan and the conservative government began its attempt to abolish the NPA, the labor unions and the opposition parties came to its rescue. Since then, it has been an agency that has prevented the government from unilaterally cutting public sector wages.

The autonomy of the NPA has led to two outcomes. First, compared to the prewar period, the NPA has drastically reduced the wage differentials within the civil service. Despite the stark difference in their status, the pay differentials between the Career and Non-Career Bureaucrats have also remained quite small. This egalitarian wage structure in the civil service has proved more robust to changes than other advanced countries that have shifted toward a more "flexible" wage structure (Nishimura 1999). Second, the independence of NPA has limited the expansion of the public sector. Because the politicians could not control wage levels in the public sector, the LDP government has repeatedly tried to curtail the number of civil servants. A legal limit on the total number of central government employees was introduced as early as 1969, and the size of the public sector has remained significantly smaller than the Western countries (Maeda 2014).

### Retirement

Although civil servants are protected from dismissal, many of them retire early. Until the early 2000s, it had been customary for each ministry to

arrange for a managerial position in a quasi-government organization or a private enterprise, and offer it to Career Bureaucrats who can no longer be promoted. This "up-or-out" practice has been called the "descent from heaven" (*Amakudari*), since the bureaucrats were perceived to be moving "down" into the private sector. *Amakudari* was an essential component of the Career System, since it allowed each ministry to fill the upper positions according to seniority. With fewer positions at the top and strict limits to the expansion of personnel, the Career System requires a constant number of civil servants to voluntarily retire if they are to replenish their organization with new recruits each year. While there are no precise figures on the extent of *Amakudari*, this practice is considered to have been most prevalent during the 1980s, with hundreds of former Career Bureaucrats on the boards of directors among major corporations (Colignon and Usui 2003).

During Japan's period of high economic growth, this practice was considered to have at least two beneficial functions. First, *Amakudari* was considered to have provided a useful way of motivating and attracting talented college graduates. Because the NPA had kept the pay levels for elite civil servants quite low, the only way to attract the top graduates from the elite universities in the postwar period was to provide them with a delayed form of gratification. Second, *Amakudari* was also considered to have enhanced the effectiveness of Japan's public policies. According to this argument, because the managers in the major corporation had personal ties to the civil servants, they were eager to provide the ministries with useful information on the conditions of their industries, and comply with their administrative guidance (*gyosei shido*). Some go as far as to argue that this "embedded autonomy" was a general feature of other late industrializers in East Asia like Korea and Taiwan (Evans 1995).

## Recent Reforms

With the collapse of Japan's economic growth in the 1990s, the civil service suffered a drastic loss of reputation. The MOF was especially badly hit toward the end of the decade, as their close connection with the financial sector through *Amakudari* was blamed for causing a widespread banking crisis (Amyx 2004). In the era of so-called Bureaucrat-Bashing; (*Kanyo-Basshingu*), virtually all of the supposed virtues of the postwar Japanese bureaucracy came to be questioned. While the LDP largely maintained its dominant status except for two electoral losses in 1993 and 2009, new opposition parties came into the spotlight by attacking the bureaucracy. Therefore, after a comprehensive reorganization of ministries in 2001, the LDP government embarked on reforms that tightened the reins on the civil servants, laying out the basic framework in The Basic Act on Reform of National Public Officers' Systems in 2008 (Hanawa 2013). This section covers these recent developments.

### Reforming the Career System

At the heart of the current critiques against civil service is the perception that the government is run by a small group of elite university graduates who have become out of touch with reality. *Amakudari* has become synonymous for corruption, and policy stability came to be perceived as rigidity. Responding to these critiques, politicians have set out to dismantle the Career System.

First, the civil service examination has been reformed to open senior positions to a wider range of candidates. Under the Career System, civil servants who had passed the Type I examination automatically became Career Bureaucrats, while Type II and Type III examinations were used for recruiting Non-Career Bureaucrats. In 2012, this system was replaced with a new system of Comprehensive (*Sogoshoku*) examinations and General (*Ippanshoku*) examinations. While this dual system resembles the Career system, passing the *Sogoshoku* examinations will no longer guarantee promotion to senior positions. Since the new examinations have only recently begun, the effects of these reforms are still unclear.

Second, tighter restrictions on *Amakudari* have made it difficult for retiring bureaucrats to move

into the lucrative posts that they once enjoyed. With the revision of the National Public Service Act in 2007, the ministries were prohibited from searching positions on behalf of their retiring officials. In other words, retiring Career Bureaucrats were now expected to find a new position on their own. Nevertheless, some argue that the ministries are still covertly arranging *Amakudari* for their employees. On the other hand, recent efforts to place limits on *Amakudari* has led to an increasing number of senior civil servants who do not retire despite being passed over for promotion. Since there have not been enough managerial positions to distribute among these senior bureaucrats, the career system has become increasingly difficult to maintain.

### Introducing Political Appointments

Another contemporary critique of Japan's civil service is that the bureaucrats only care about their ministries and ignore the wider public interest. Although the cabinet ministers have had the legal authority to control the promotion of personnel in each ministry, they have usually lack the required knowledge to choose their subordinates, and have had no choice but to follow the recommendations by the civil servants. This has meant that politicians have lacked the means for directly controlling the bureaucracy.

A new development in this area is the establishment of the Cabinet Bureau of Personnel Affairs in 2014. Its role is to choose approximately 600 senior civil servants in each ministry. In the past, the ministries would prepare their own list of promotions, and the cabinet would give them approval. According to the new system, the Cabinet Bureau of Personnel Affairs will collect a list of candidates from the ministries, and make its pick based on the priorities of the cabinet. By allowing political leaders to directly appoint their favored candidates to the top positions, the civil service will more directly reflect the policy preferences of the ruling politicians.

However, this new system is not without its critics. First, this reform might lead to a decline in the quality and neutrality of the civil service. Senior civil servants will now have an incentive to lobby the political leaders in order to be promoted. While this is different from a spoils system in which political leaders appoint officials regardless of their experience in the civil service, it might lead to the promotion of incompetent individuals who simply cater to the will of the ruling party. Second, allowing the politicians to have a stronger hand in picking the top civil service positions may lead to policy instability or inconsistency when the government changes hands. These two scenarios depend on the political fortunes of the ruling party. The first outcome will occur if the LDP continues to stay in power, whereas the second outcome will occur if it does not.

### The Promotion of Women

One of the signature policies of the current Prime Minister Shinzo Abe is the promotion of women in the civil service. First, he has directly promoted women to managerial positions. Between 2014 and 2015, the Cabinet Bureau of Personnel Affairs doubled the number of female bureau chiefs from 8 to 15. Second, the Abe administration has also focused on recruiting more women. In 2015, the government announced that it will increase the share of women among the new entrants from the *Sogoshoku* examination to 30%. The actual results surpassed this target, with a jump from 24% to 34% in a single year. This second strategy is more indirect than the first, since it typically takes around 20 years for a new civil servant to reach the level of section chief under Japan's career-based system.

Furthermore, recent years have seen efforts to improve the working conditions for the civil servants. Career Bureaucrats have been known for their excessively long working hours, especially when the National Diet has been in session. Typically, the opposition would submit their questions in the evening, and the bureaucrats will work through the night to prepare the government's response for the next day. This practice has assumed a male bureaucrat supported by a housewife, making it difficult for married female bureaucrats to fulfill their tasks. Since 2015, the government has begun its attempts to deal with this problem. For example, it has

moved up the closing time of the ministries during the summer months in order to provide their employees with free time during the evenings (*Yukatsu*). This third strategy is even more indirect than the first and the second, since it depends on whether the opposition parties would be willing to ask fewer questions and submit them earlier.

While these attempts may bring more women into the upper levels of the civil service, it is not connected to a feminist agenda. In fact, Shinzo Abe has been well known for his conservative views. The current reforms are part of a strategy of bringing women into the workforce for the sake of economic growth (*Womenomics*). In other words, this is a reform that focuses on elevating the status of elite women, not a project of gender equality.

## Conclusion

Japan's recent civil service reform begs one question: why now? Although its advocates have argued that they are fixing a broken system that lacks the capabilities to deal with the challenges of the twenty-first century, there is not much evidence to support their diagnosis. While the elite bureaucrats may not have been the engineers of Japan's postwar economic growth, it is unclear why they needed to be blamed for the economic stagnation in the past couple of decades. In comparative perspective, the logic of Japan's civil service reform resembles the populist phenomenon that is currently sweeping the Western democracies. Since the civil servants are few in number, they have been an easy target for politicians trying to carve out a base of support by directing the anger of the public against the establishment.

To a certain extent, the decline of Japan's civil service is a self-fulfilling prophecy. By blaming the civil service for its incompetence, the politicians have reduced its reputation and privilege to an all-time low. Because of this, the civil service is no longer the first choice among the elite college graduates. Therefore, there may be a significant decline in the quality of civil servants in the coming years. Because Japan's civil service is slow to change, this has not yet occurred.

# Job Classes and Tasks of Public Procurement Professionals

Joshua M. Steinfeld
School of Public Service, Old Dominion University, Norfolk, VA, USA

## Synonyms

Acquisitions; Contract management; Contracting; Government officials; Government workers; Hierarchy; Job activities; Job classifications; Job duties; Job positions; Organizational structure; Practitioners; Procurement scholars; Public administrationists; Public administrators; Public personnel; Public servants; Purchasing; Supply management

## Definition

The governmental actors and their occupational duties performed and managed through delegation and execution of purchasing and supply chain functions that demonstrate professionalism in public service.

## Introduction

Public procurement practitioners and scholars have been seeking autonomy and credibility in attaining jurisdiction over a number of public management decision-making functions beyond the traditional role of purchasing or buying public goods and services. Similar to the broader field of public administration, there is debate in regards to what constitutes the roles and responsibilities of practitioners, and what approaches to practice are characteristic of professionalism. There are several advantages to understanding professionalism in public procurement such as a desire to ensure that members of the profession prescribe to a certain quality of practices in delivering goods and services to their respective stakeholders. Since public procurement involves decisions that have social and economic impacts, it can be stated that the roles and responsibilities of practitioners extend beyond conventional purchasing practices of acquisition or contracting.

As an example, the decision to purchase particular goods or services typically establishes a relationship with a private sector entity enjoying economic profits, requires the use of public resources that involves trade-offs in terms of opportunity costs, and the provision of public goods and services dictates the social behaviors associated with use of these offerings. Essentially, public procurement entails multisector collaborative efforts with numerous exogenous factors in the decision-making process and social and economic externalities in terms of results from output. Given the complexity of public-private partnership involved in the public procurement function, in addition to the impacts to governance and consumers of public goods and services, it is necessary to present a model for professional practices and identify which public servants are responsible for engagement.

One of the approaches for studying the roles and responsibilities of professionals deal with honing-in on the job tasks performed and managed by practitioners who demonstrate characteristics of public sector professionalism. In doing so, the job classes of practitioners who may be considered professionals need to be identified so that public managers and residents know which practitioners are to be held accountable. Furthermore, it is the job tasks of public procurement professionals that may serve as a model for professionalism in the field.

To determine a standard set of job classes and job tasks for public procurement, the Universal Public Procurement Certification Council (UPPCC) administered a survey to practitioners regarding the performance and management of 75 job tasks. A factor analysis is implemented herein so that the job tasks reportedly performed and managed by practitioners can be studied and assessed. The 17 job descriptions reported by survey respondents, e.g., chief procurement officer, project manager, intermediate-level buyer, compliance officer, contract administrator, can be organized into broader job classes, which

provides a starting point for beginning to understand the roles of professionals in public procurement. One of the reasons for development of an organizational structure of job classes is to standardize the job positions of public procurement practitioners to improve the quality of public procurement decision-making for the purposes of maximizing the social and economic benefits created from provision of public goods and services. The creation of an organizational structure among practitioners adds substance and maturity to the field, which in turn establishes a foundation for professionalization of public procurement.

This entry will first provide an inquiry into the study of public sector professionalism as it relates to public administration, the field for which public procurement belongs. Public procurement practitioners are indeed public administrators, and hence the tenets of professionalism in public service serve as standards and guidelines for professional procurement practices. In addition, aspects of professionalism as they relate to the core purchasing and supply functions inherent to public procurement are presented as a path for pursuing discovery of professional roles and responsibilities. Subsequently, these core professional values and the obligations of practitioners serve as bases for converting ideology into action through performance and management of specific job tasks. Based on roles and responsibilities of public procurement practitioners, specific job tasks can be delegated and executed to achieve desired outcomes that fulfill practitioners' commitments and obligations as professionals in the public sector.

As a result, this entry focuses on professional job tasks in public procurement as a way of benchmarking the model action-orientation of practitioners. Also, these practitioners self-relate with distinct job descriptions that can be grouped together to establish broader categorizations of job classes that are inclusive of various job descriptions that may vary according to agency or organization. It is important to establish an organizational structure for public procurement practitioners so that government officials and the public at-large are aware of whom to rely upon and hold accountable for decision-making and for the upholding of professionalism in public procurement and administration.

## Professionalism in Public Procurement and Administration

Practitioner job tasks and job classes are fundamental to studying the attributes of professionalism and factors related to politicization. To determine what it is that public procurement practitioners do in terms of their job tasks, and to identify the various job classes of actors, it is important to first develop a context for the roles and responsibilities of a professional in the public sector. Practitioners in the public sector need to adhere to certain ethics, standards, guidelines, and various traditions that serve as precursors for approaching job tasks of the profession. Technical specialty and rigor are unique attributes of professionalism that involve task-specific capabilities related to a coherent specialization of higher-level practitioners, which could be potentially referred to as professionals.

A major challenge to identifying the specific job tasks and job classes of professionals in public procurement is determining a framework that captures the artistic and scientific elements underlying professionalism in public service. There has been longstanding discourse regarding the context and validity of professionalism in accordance with task specialization. For example, public administration has been proclaimed to resemble business, science, and art, and each view of public administration has different implications for the meaning of task specialization, and hence the actual and appropriate job tasks of professionals. Public administration has been said to relate to scientific management and business, where managerialism and efficiency are the guiding criterion for government operations. On the other hand, public administration can be viewed as an art through pragmatism, interpretation, and epistemology, as if functioning more like a craft of inquiry than a means to an end.

There are numerous other tenets of professionalism that connect the business, science, and art of

public administration. The interdisciplinary field can be viewed as a conduit for studying the science of human behavior to achieve a better understanding of psychology and sociological factors involving both government and residents' interaction in the public sphere. Through these humanist orientations, the policy-making and political processes that establish and control governance can be devised and implemented. The logic and psychology of these premises can be debated and accepted as options for choice. The professional public administrator therefore aims to interpret laws wisely and in the public interest from the ability to engage theory, science, and comparative systems of governance. Different combinations of theory and value orientations create varied interpretations leading to preferred political styles, conflicting approaches to dealing with public issues, and qualities that may be controversial in defining citizenship. A public administrator displaying professionalism must be able to inculcate an orientation to the world so that there is consistency in meaning making and public perception in order for resolutions to be structured and problems solved.

The neutral orientations, and conversely the political orientations of public administrators, also serve as points of contention in modeling professionalism. Public sector professionalism can be based upon neutral tenets of democratic administration such as constitutionalism, scientific management, power of reason, and mechanism, whereby rational calculation, benefit-cost formulaic, and functional expressions are mantras to decision-making. Differently, public administration can be politicized by addressing social functions dealing with political values, stances, equity, equality, pluralism, interest groups, or bureaucratic expertise. The neutral approach can be summarized according to instrumentality, efficiency, effectiveness, and finding the correct answer to solve problems through specialized knowledge grounded in theory, science, and mathematics, whereas the political approach involves balancing competing factions, prioritizing public interest, and strategic maneuvering within government's enterprise of public agencies, municipalities, and quasi-organizations.

The public procurement profession contends with the same competing orientations to performing public service. Public procurement specialists can abide by a neutral, ideal-type bureaucracy in delegating and executing procurement processes and procedures according to a practical regard for laws, statutes, mandates, and policies. On the contrary, public procurement specialists can assume political roles through focus on interactions between organizations, principals, and agents, and influences from the social and economic environment. Practitioners follow neutral modes of professionalism through outsourcing, privatizing, and contracting-out where procurement specialists become middle-managers, leaving the social, economic, and political factors to be addressed by contractors and vendors. The neutral professional of public procurement makes decisions according to the dyadic and bilateral elements involved in linear relationships. Here, the private sector and nonprofit entities perform the specialized, technical work that public procurement practitioners once loved. In this regard, public procurement practitioners follow market-based business best practices such as quantitative performance measures, notional value-for-money, and marginal production functions of supply and demand.

The politicized professional of public procurement makes decisions considering the three pillars of public, private, and nonprofit sectors. In this case, there is a circular interaction between exogenous factors such as the social and economic environment, public policy arena, stakeholder organizations, and the purchasing practices within one's own organization and perceived organizational contexts. In this manner, political factors such as the needs and wants of interorganizational participants can impact the decision-making that takes place with respect to the nature and type of specific procurements. With politicization, decision metrics are lax, the process allows for subjectivity and adaptability, and outcomes are less certain. The emphasis shifts from mechanistic practices to human relationships, learning dynamics, and facilitation of intended goals and objectives, even if the outcomes appear to be advantageous to one

particular social class or group. Depending on the situation and circumstances, the roles and responsibilities of practitioners vary in terms of who public procurement practitioners are accountable to.

## Public Procurement Roles and Responsibilities

The challenge for public procurement professionals is that their attention is devoted to practical, day-to-day operations of government, but their roles and responsibilities include concern for enhancing the civic character of policy participants. However, mantras such as efficiency and effectiveness are often favored over responsibility or inclusion. Public procurement practitioners are faced with the presence of multiple, competing, and alternating performance expectations of diverse, legitimate, and conflicting sources. For example, practitioners deal with trade-offs between being accountable to the procurement department and their own organization, or the agency and the contractor. Ultimately, the roles and responsibilities of practitioners are contingent upon shared impressions involving the key stakeholders, programmatic issues, political factors, client satisfaction, points of ongoing conflict, and unresolved issues.

The roles and responsibilities of public procurement practitioners are oftentimes centered on aspects of accountability, in which there may be a missing link between outcomes and objectives of good governance or democracy. For example, the outcomes vis-à-vis public policies of elected officials are reflected through specific procurements; however, when the public procurement function fails in delivering the appropriate quality or quantity of public goods/services demanded by the public, the political actors are not held accountable. Instead, the public procurement practitioner is found culpable. In other cases, the tangential consequences or externalities of specific procurements or broader public procurement objectives are not taken into account, or fail to be identified. More often than not, public procurement's customers are actually internal departments that need particular inputs thereby insinuating devolution from implications resulting from the political needs and wants of policymakers and residents.

Along these lines, public procurement is seen as a reactionary conduit to the strategic planning function, which is often politicized. However, this regressive nature of the public procurement function separates its practices from the political function that initiates action. Conventionally, only after the public organization has developed core values and objectives that functional procurement strategies can be put into place according to macro policy goals and budgetary resources. Without a strategic alignment between the agenda-setting policy that steers organizational objectives and the procurement function, it becomes difficult to establish public procurement as a complementary function to good governance and democratic ideology.

Specialists in public procurement, serving as agents in purchasing roles yet shift managerial responsibility, may have a greater tendency toward corruption, immoral practices, or the commodification of citizenry. Purchasing agents who are delineated from strategic planning functions tend to focus on market-based purchases and may be inclined toward privatization, which can threaten democratic ideologies and constitutional rights, as has been seen in case study examples involving private prisons, mental health rehabilitation centers, and defense contracting, among others. Public policy directives, policy goals, and program requirements may be ambiguously defined and monitored infrequently, making it difficult for public managers to evaluate frequency, consistency, and quality of service in light of privatized or contracted-out social services. It is the policy school of thought, grounded in theoretical and socioeconomic techniques, which has provided public managers with an applicable understanding of the deficiencies in separating politics from procurement, thus leaving motivational, humanistic, and political aspects unexplored.

Ideally, public procurement serves both technically rational administrative functions and functional conduits for the proliferation of political

will. This requires that public managers exercise discretion in the provision of public goods and services. De-politicization in public procurement can lead to goal divergence between public policy directives and implementation, presenting deficiencies in responsibility. The issue of trust comes into play when procurement activities are based solely on positivist functions. It is important to establish strategic relations between political actors, an aspect of trust that is based on the knowledge of and experience with other parties. Responsibility through trust is a major political function involving psychological and social processes inherent to developing, maintaining, changing, and continuity of operations.

Public procurement personnel therefore are expected to contribute to the strategic policy process by interpreting what good service means through reconciling the diverse values of varying constituent groups and deeper community cultures. Public procurement practitioners ensure responsibility by balancing numerous sources of authority including board policies, purchasing guidelines, public hearing requirements, and civil service regulations. If responsibility is degraded with respect to failure in catering to, or considering stakeholder factions, there is a chance of eroding democracy and impeding citizen participation, leading to neglect of values and public interest.

Public procurement struggles between identifying its practices as being task-based, economic, apolitical, and rational, or being necessarily imbued with politicization, social conditions, and constituencies. Public procurement pursues socioeconomic ends in its role and responsibility to provide public goods and services that follow tenets of good governance involving transparency, accountability, and the efficient and effective provision of goods and services as demanded by the public. The professional public procurement practitioner balances the varying roles and responsibilities by considering the rational and political complexities of public service. To study how these professional roles and responsibilities are carried out, the job classes and tasks of public procurement are examined.

## Job Classes and Tasks in Public Procurement

Considering the roles and responsibilities, and various functions served by public procurement practitioners, this section looks at job tasks performed and managed in public procurement and the job classes of practitioners. The UPPCC conducted a survey in 2012 aimed at devising valid, testable metrics for candidates seeking to earn the Certified Public Procurement Buyer (CPPB) and Certified Public Procurement Officer (CPPO) credentials. Subject matter experts (SMEs) developed 75 job tasks and 17 job descriptions for survey respondents; there were 2549 public procurement practitioners who completed the survey. Respondents were asked whether they (1) perform, (2) manage, (3) both perform and manage, or (4) neither perform nor manage, each of the 75 job tasks. Respondents were also asked to self-identify with one of 17 different job descriptions on the survey. The data collected for the UPPCC survey is utilized herein for analysis of job classes and job tasks of public procurement.

The self-identified job descriptions from the UPPCC survey are grouped into job classes using a qualitative approach in order to demonstrate the roles that are generally assumed by practitioners. The job descriptions are grouped into broader job classes to compensate for differentiations in job descriptions across organizations. For example, some organizations may connote differently the job description of program manager as opposed to project manager, or senior-level buyer, as opposed to intermediate-level buyer or entry-level buyer. Table 1 shows the job classes of public procurement practitioners as surveyed according to job descriptions.

A factor analysis is subsequently conducted for determining which job tasks are performed and managed by public procurement practitioners. A factor analysis enables relationships to be drawn in situations when there are numerous variables being tested (75 job tasks) and there is a desire to identify robust results. For example, among 2549 practitioners, it can be assumed that each of the 75 job tasks will be reportedly

**Job Classes and Tasks of Public Procurement Professionals, Table 1** Job descriptions and job classes in public procurement

| Job description | Frequency | Job class |
|---|---|---|
| CPO | 118 | CPO |
| Director/manager of procurement | 137 | CPO |
| Assistant director | 137 | Procurement manager |
| Program manager | 72 | Procurement manager |
| Program supervisor | 31 | Procurement manager |

performed, managed, or both performed and managed by at least one of the 2549 respondents. However, just because one individual completes a job task that does not mean that the job task should be considered a staple of public procurement.

The objective here is to identify job tasks that are performed, managed, and both performed and managed by a substantial number of practitioners on a consistent basis, such that these job tasks can be considered to be part of the core functional roles and responsibilities executed in public procurement. The factor analysis statistical technique allows the researcher to achieve this objective; only job tasks that are correlated with each other in terms of being either performed, managed, or both performed and managed will result. So, job tasks completed in isolation, or for which there is not a correlation between completing similar job tasks, will not be included in the results. Only job tasks sharing correlations, such that job tasks are completed in combination toward accomplishment of a public procurement function, are identified as job tasks in public procurement.

The results of the factor analysis demonstrate that the following job tasks are performed, managed, and both performed and managed in public procurement (Table 2). Each of the three columns labeled "perform," "manage," and "both perform & manage" reflect the job tasks that are reportedly solely performed, solely managed, and both performed and managed by practitioners. The first column denoted "JD" indicates the job domains for which the job tasks relate based on a qualitative view of the nature of the job tasks that share correlations.

It is interesting to note that job tasks involving the job domain of Sourcing are either solely performed or solely managed in public procurement, not both performed and managed (see Table 2). Additionally, the job tasks related to the Contract Administration job domain are typically both performed and managed, as opposed to solely performed or solely managed. Furthermore, job tasks related to Procurement Management such as "implement operating work policies, guidelines, and procedures," "interpret policies and procedures," "manage department personnel," "train purchasing department personnel," and "review procurement requests for compliance with established laws, policies, and procedures" are both performed and managed, but not solely

Job domains (JD) of related job tasks – *SU* Sourcing, *SO* Solicitation, *NG* Negotiations, *SM* Supply Management, *SP* Strategic Procurement Planning, *CA* Contract Administration, *PM* Procurement Management

performed or solely managed. There could be numerous reasons for these particular findings.

First of all, the Sourcing job domain involves job tasks that could be completed individually, and thus a single practitioner may perform the task or a more senior practitioner may manage a subordinate to perform the task. As examples, the job tasks of "utilize an internal automated procurement system," "conduct market research to ascertain the use/availability of commercial items and services," "obtain historical information for decision making," "identify source of supplies," and "select method of procurement" are job tasks that may be performed individually or managed, and do not require the added dynamic of both performing and managing by a practitioner to complete the task. Secondly, the Contract Administration job tasks may be both performed and managed because of the complexities involved with delegating and executing tasks within this job domain. Job tasks such as "mitigating risk through terms and conditions," "conduct post-award debriefing," "conduct post-award conference," and "conduct closeout activities" may involve the mobilization of numerous practitioners which would constitute managing, but that a practitioner who manages these job tasks may also assume a role in performing as well.

Third, the Procurement Management domain only applies to job tasks both performed and managed, again perhaps because these job tasks involve a dual-dynamic that requires the same practitioner to both perform and manage the task. For example, the job tasks "implement operating work policies, guidelines, and procedures for the control of the department's work flow," "interpret policies and procedures," "manage department personnel," and "train purchasing department personnel" require discharging roles and responsibilities to numerous practitioners in order to get the job task done. In order to "implement operating work policies, guidelines, and procedures for the control of the department's work flow," numerous team member practitioners must be involved and the managing practitioner must also participate as they must be held accountable

for the same policies, guidelines, and procedures. The same logic holds true for the job task "interpret policies and procedures." Additionally, the job tasks "manage department personnel" and "train purchasing department personnel" may typically involve a team of managers, or team of trainers, in which case the practitioner would manage these teams and likely perform the job task in order to model the way for these teams.

Aside from the differentiations between performing, managing, and both performing and managing job tasks, the 59 job tasks that result from the factor analyses (see Table 2) demonstrate the job tasks of public procurement. Therefore, of the 75 job tasks devised by the SME's for the UPPCC survey, only 59 job tasks can be said to be indicative of public procurement. These 59 job tasks are reflective of the profession based on the various elements of professionalism that are captured in these job task statements. The previous sections on professionalism and roles and responsibilities in public procurement and administration reflect aspects of accountability, transparency, law, economics, cost-benefit, policy, procedure, and values, among other considerations involved in studying public sector professionalism. By looking at the complete list of job tasks (see Appendix), it is determined from the robust results of the three factor analyses that these 59 job tasks are indicative of the job tasks deemed to constitute the public procurement professional.

## Conclusion

This entry identifies the job classes and job tasks of public procurement professionals. Through a discussion of professionalism in public procurement and administration, and the roles and responsibilities of public procurement practitioners, it can be seen that overall these job tasks capture the diverse elements inherent to public sector professionalism. There are 59 job tasks found to be present in the profession of public procurement that are either performed, managed, or both performed and managed by practitioners. These public procurement practitioners constitute five job classes including CPO, Procurement Manager, Procurement Analyst, Buyer, and Procurement Assistant.

The findings demonstrate that there are numerous job tasks that are performed, managed, and both performed and managed across a breadth of public procurement professionals that consist of five distinct job classes. Also, these job tasks are not only reportedly performed, managed, and both performed and managed, but the job tasks share specific relationships with each other so that job tasks are completed in tandem, or in conjunction with other job tasks such that they may be completed as a conduit for the completion of broader public procurement job functions. The notion that there are specific, related job tasks in public procurement indicates that the field is a mature occupation that may be considered a profession with defined standards for practice.

There are numerous avenues for future research and inquiry that result from this entry. The manner in which these job tasks are approached, either politically or neutrally, can be inquired upon to study how job tasks are delegated and executed differently according to a political or neutral orientation. Also, the outcomes from the completion of the job tasks according to a political or neutral narrative can also be studied to determine how outputs and externalities would vary according to specific procurements. Furthermore, the mode for completion of job tasks involving either performing, managing, or both performing and managing deserves additional attention from organizational and operational standpoints. Perhaps some job tasks are best completed through one mode of completion or another, and the interaction of practitioners by means of performing, managing, or both performing and managing may shed light on how public procurement professionals go about completion of their work. This could provide insight into how public procurement departments and public organizations may improve aspects of efficiency and effectiveness, in addition to consideration of the political elements that together constitute public procurement professionals.

## Appendix

### Job Tasks Key for Table 2

**Utilizeautomprocurementsystem** – Utilize an internal automated procurement system

**Procurementcomplianceandlaw** – Review procurement requests for compliance with established laws, policies, and procedures (e.g., bid thresholds, small business programs, completeness of specifications, available funds, appropriate approvals)

**Conductmarketresearch** – Conduct market research to ascertain the use/availability of commercial items and services

**Usehistoricalinfofordecisions** – Obtain historical information for decision making (e.g., forecast estimated demand, sourcing, procurement method)

**Identifysourceofsupplies** – Identify sources of services and/or supplies

**Selectmethodofprocurement** – Select method of procurement (e.g., small purchases, procurement card, competitive sealed bids, competitive proposals, cooperative purchasing)

**Upholdpromotmissionvisionvalue** – Uphold and promote the mission, vision, and values of the procurement department (e.g., ethics, diversity, professionalism, accountability)

**Selectcontracttype** – Select contract type (e.g., blanket order, term contracts)

**Developsolicitationdocument** – Develop solicitation document (e.g., product specifications/scope of services, terms/conditions, performance period)

**Reviewsolicitationdocument** – Review solicitation document (e.g., consistent language, no conflicting requirements)

**Solicitcompetitivequote** – Solicit competitive quotes

**Solicitcompetitivebids** – Solicit competitive sealed bids/tenders

**Solicitcompetitiveproposals** – Solicit competitive sealed proposals

**Ensuretransparentprocesses** – Ensure a transparent solicitation process that provides for open and fair competition

**Identifyevaluationmethodology** – Identify evaluation methodology/criteria and select team

**Conductprebidconferences** – Conduct pre-bid or pre-proposal conferences

**Prepareandissueaddenda** – Prepare and issue addenda

**Analyzeevaluatesolicitations** – Analyze and evaluate solicitation responses (e.g., responsiveness, responsibility)

**Preparerecommendationaward** – Prepare and make recommendation for award

**Preparecontracts** – Prepare and execute contractual documents (e.g., contract, award letter, acceptance agreement, purchase order)

**Selectmethodofprocurement** – Select method of procurement (e.g., small purchases, procurement card, competitive sealed bids, competitive proposals, cooperative purchasing)

**Preparenegotiationstrategy** – Prepare negotiations strategies (e.g., goals, outcomes, tactics, positions)

**Conductnegotiations** – Conduct negotiations (e.g., pricing, terms, renewals)

**Documentnegotiationprocess** – Document negotiation process and results

**Selectnegotiationmembers** – Select negotiation team members and assign roles

**Maintaininventory** – Maintain inventory (e.g., safety stock, stocking levels)

**Designinternaldistributechannel** – Design internal distribution channels

**Establishwarehouseshipprocess** – Establish warehouse shipping and receiving processes (e.g., acceptance, rejection)

**Disposesurplusequipmaterials** – Dispose of obsolete and surplus equipment and materials

**Accountforassets** – Account for assets (e.g., fixed, capital, consumable)

**Followupandexpediteorders** – Follow-up and expedite orders

**Resolvedeliveryreceivingprobs** – Resolve delivery and receiving problems

**Selectmethdisposequipmaterial** – Select method of disposal for obsolete and surplus equipment and materials

**Facilitatemovementofgoods** – Facilitate movement of goods (e.g., transportation logistics, delivery locations)

**Conductbusinessanalyses** – Conduct business analyses (e.g., outsourcing, privatization, partnering)

**Analyzeeconmictrendcondition** – Analyze economic trends and conditions that affect procurement

**Conductcostbenefitacquisition** – Conduct cost/benefit analyses on future acquisitions

**Implementprocessimproveplan** – Implement a process improvement plan (e.g., stakeholder satisfaction, remediation)

**Planimplementprocurestrategy** – Plan and implement procurement strategies and objectives based on forecast data, market factors, economic trends, and customer needs (e.g., strategic sourcing, staffing)

**Conductvalueanalyses** – Conduct value analysis (e.g., cost reduction, cost avoidance, total cost of ownership)

**Implementgoalobjectivemeasure** – Implement goals, objectives, and measurement criteria for procurement department

**Formprocurecontingencyplan** – Formulate a procurement contingency/continuity of operations plan (e.g., disaster preparedness, supply chain)

**Monitorlegislativetrendslaws** – Monitor professional and legislative trends and laws (e.g., rules, regulations, executive orders)

**Developstaffsuccessionplan** – Develop staff succession plan

**Establishmissionvisionvalues** – Establish the mission statement, vision, and operating values of the procurement department

**Upholdpromotmissionvisionvalu** – Uphold and promote the mission, vision, and values of the procurement department (e.g., ethics, diversity, professionalism, accountability)

**Monitorsuppliercompliance** – Monitor contractor/supplier compliance (e.g., insurance requirements, licensing requirements, prevailing wage)

**Modifycontracts** – Modify contracts

**Remediatesuppliernoncomplianc** – Remediate contractor/supplier noncompliance (e.g., cure notice, show cause notice)

**Resolvedisputes** – Resolve contract disputes

**Terminatecontracts** – Terminate contracts (e.g., default, convenience, non-appropriations)

**Evaluatesupplierperformance** – Evaluate contractor/supplier performance (e.g., quality control)

**Conductpostwawarddebrief** – Conduct post-award respondent debriefing

**Mitigateriskthrutermsconditions** – Mitigate risk through development of terms and conditions

**Conductpostawardconference** – Conduct a post-award start-up conference

**Conductcloseoutactivities** – Conduct contract closeout activities

**Implementoperatingworkpolicy** – Implement operating work policies, guidelines, and procedures for the control of the department's work flow (e.g., training manuals, Code of Ethics, Standard Operating Procedures [SOP], process improvement]

**Interpretpoliciesandprocedures** – Interpret policies and procedures (e.g., apply policy situationally, respond to questions about policies and regulations)

**Managedepartmentpersonnel** – Manage purchasing department personnel (e.g., evaluate, counsel, discipline, coach)

## Synonyms

*Motivation*: Agenda; Driving force; Impetus; Inclination; Motive; Predetermination; Reason; Vigor

*Job Satisfaction*: Employee happiness; Employee satisfaction; Job enjoyment; Joy of work; Pleasure of working; Work comfort

## Definition

**Motivation** is an inclination towards a certain pattern of behavior caused by an internal or external stimulus.

**Job satisfaction** is the feeling of an individual involved in work activity evoked as a result of the match between the rewards that come from this activity and her or his unique set of motivational drivers.

## Introduction

While one can easily observe somebody's work effort, she can only guess about the motivation behind. Because work motivation is difficult to see or measure directly, the scholars came up with a number of theories to grasp this invisible construct. Most popular theories that explain employees' motivation and behavior came from social psychology and management where they have been designed either for business organizations or without any specific referral to any particular sector. They are Vroom's expectancy-valence motivation theory, self-determination, job characteristics model, and Herzberg's two-factor theory. While there is abundant literature on the mentioned theories, this encyclopedia entry only briefly refers to some of them during our discussion of motivation antecedents along intrinsic-extrinsic dichotomy. For the students of the nonprofit sector, the question remains to which extent they can apply these tools developed and tested in other social sciences.

Meanwhile, public administration as a field of science has recently come up with its own theory of motivation of a public service employee, referring to the unique bond between the workers and the beneficiaries in the non-for-profit sectors. This theory called public service motivation found a vast applicability in the public sector research all around the globe. The applicability of the public service motivation theory as an emerging theory in the nonprofit research is discussed in a separate subsection further on in this entry.

Scholars have been raising the issue that the nonprofit sector requires other motivational theories than those applied to workers of for-profit organizations. Meanwhile, current generation of the researchers is witnessing a quite opposite effect, when there have been a lot of merging between the sectors due to the exchange of managerial practices and labor force between the sectors of economy. The more there is benchmarking of the best practices, the more the border between the sectors seems to disappear: while nonprofits become more professionalized, willingly or not businesses widely assume social responsibility (Prysmakova and Tantardini 2016). So grows the number of entrepreneurs who start social enterprises with a focus on social benefits rather than exclusively on their profit maximization. On the other hand, some fundamental differences between the sectors remain the same. Nonprofits are still less hierarchical and are under stronger economic pressures. For instance, they cannot distribute the profit among their owners, because there is none in particular, and the true owner is a society at large. Nonprofits heavily rely on volunteers' participation as compared to small percentage of interns to the total number of staff in business organizations – who can to a certain extent be considered private sector volunteers because they are not- or under-paid.

These major differences, which are impossible to overcome, persist preserving nonprofits as complex and distinctive structures with its own mix of extrinsic and intrinsic incentives that attract workers who are not predominantly driven by monetary remuneration. It is widely assumed that workers show markedly different economic motivations in nonprofit, public, and private sectors, while intrinsic and relational motivations are more similar and differences are hardly significant across organizational forms. The research shows, however, that while economic forces are indeed stronger in for-profit organizations, the nonprofit workers value higher the work involvement and the importance of personal interaction with the beneficiaries of services provided. Possible differences between sectors might determine the

stability of motivational patterns, whether they are temporary states or stable traits of character.

Recent studies revealed significant differences between for-profit and not-for-profit employees in three out of four motivational concepts (De Cooman et al. 2011). While employees do not differ in their work effort, nonprofit employees have a better person-organization fit. For-profit employees give more importance to advancement. They are more motivated by material rewards and are more malleable to social pressure. Meanwhile, nonprofit workers value social service participation. They are better motivated to engage in the activity because of personally meaningful outcomes and when organization's values coincide with an employee's value system.

While the nonprofit sector diverges from other sectors, there is a considerable variation among the different types of nonprofits as well. For example, the study of social service organizations in Italy revealed that religious organizations might serve as a last resort employment opportunity. Therefore, the employees would primarily emphasize job security, pay, and career advancement (Borzaga and Tortia 2006), than in similar secular nonprofit organizations.

Employees' motivation and their job satisfaction are tight together. Joy of work is the result of individual motivational drivers met by the job incentives. As motivation is mainly the cause of the satisfaction with certain job activity, the detailed discussion of job satisfaction comes after the discussion of motivation.

## Types of Job Motivation

There is a long list of various types of motivation that occur in the workplace such as inclinations to perform quality work, to undertake extra-curriculum activities, to stay overtime, to perform work for others, or to perform work for oneself. Recent studies also show that different types of motivation occur in nonprofits with different services. For example, one should expect variations between educational and health organizations, because hospitals, at least in developed capitalist societies, may resemble for-profit institutions more than schools. Therefore, they have incentive systems and motivational drives closer to business organizations (Schepers et al. 2005).

## Antecedents of Job Motivation

The first question is where the motivation comes from. In general, motivation occurs as a desire towards certain rewards. These rewards may be of different kinds: economic and noneconomic, monetary and nonmonetary, self-regarding, other-regarding, and process-regarding. Choice of the preferred rewards depends on a number of external factors and internal antecedents. For example, job characteristics model (JCM) points out features that externally impact motivation, namely, through skill variation, significance put on a task, completion of tasks from start to finish (known as task identity), granted autonomy, and feedback received. Knowledge of results could also serve as a motivation cause, creating a motivation-satisfaction loop. Internally, an important role is played by a personal biography (Schepers et al. 2005). For instance, one can explain motivation if she know the internal reasons why a person engages in a certain activity like enjoying working with students, or when one knows career and family context and notices how employee's private life influences the performance.

Peculiar to the nonprofit sector, its employees are motivated by the organizational mission and their own values are determined through this mission. Meanwhile, for-profit employees are interested in getting ahead and are better motivated by rewards and punishments (De Cooman et al. 2011). As nonprofit employees have stronger altruistic base than their for-profit counterparts, nonprofit employees are more motivated by intrinsic rewards versus extrinsic rewards like income and money (Schepers et al. 2005).

In reality, there is a continuum of incentive categories ranging from purely extrinsic to purely intrinsic. In-between, there are prestige values and relational incentives like an opportunity to form new relationships with others. Importance of relational goods consumed on the job has been strongly supported by the research (Gui and Sugden 2005). Nonprofit employees are more motivated by the possibility of social contacts.

They prefer to work with and for people (Schepers et al. 2005).

The extrinsic-intrinsic division may need an adjustment for the nonprofit sector because the dichotomy came from the for profit sector. Yet a lot of research has been done along this line that contributed to our understanding of motivational origins. Therefore, the following subsections reveal some evidence from the ends of this continuum that is relevant to nonprofit human resource management.

***Extrinsic*** Extrinsic motivation is caused by the rewards provided by exclusively an employer. The main two categories within extrinsic rewards are defined by whether these rewards can be consumed or not. Consumption goods include various individual incentives. They are monetary benefits like wage or career advancement, and nonmonetary benefits such as job security and work environment. The monetary dimension remains dominant among the consumption goods. As research shows, even in not-for-profit organizations, financial rewards can help to start a more difficult assignment (Schepers et al. 2005).

While being important for nonprofit organizations, monetary extrinsic motivation is not always a priority. Some studies show that nonprofits pay less, whereas some others show no difference. Meanwhile it is generally assumed that employees will exhibit the same work effort even if they are paid less (De Cooman et al. 2011). This could be explained by the fact that nonprofits often have a greater fairness in wage structures and, more generally, in the incentives structures when compared to private organizations (Leete 2000).

Research shows that nonmonetary consumption goods are also less important to nonprofit employees. Usually this is explained by the fact that the management system operates in a different way. For instance, in the case of career advancement, nonmonetary consumption benefits are less valuable, because in nonprofits promotions are often based on seniority rather than on competencies (De Cooman et al. 2011, Devaro and Brookshire 2007).

Thus, monetary and nonmonetary consumption goods are not the only driving forces behind workers' inclinations that can be stimulated by an employer. Besides offering a way to support employees' families, a nonprofit organization could propose a variety of not-consumption goods such as greater opportunities for training and more flexibility of a work schedule. Such nonconsumption nonmonetary benefits increase workers' individual utility through process-related incentives reflecting organizational culture and values. Examples of nonconsumption rewards are granted decision-making autonomy, variety and creativity of the work tasks, opportunities for professional growth, and recognition of workers' contribution. Nonprofits are good in some aspects of nonconsumption goods like richer task variety and individual autonomy. However, they also establish less favorable work environment for individuals with high professional growth needs (Devaro and Brookshire 2007).

Motivations to accept extrinsic incentives provided by an employer are explained by a necessity, a hobby, a way to gain recognition through economic wellbeing, to earn a living, to earn as much as possible, or to support the family. The management of a nonprofit organization manipulates workers' extrinsic motivation through such incentives as adjusted working hours, job security, friendly work environment, and a decent wage.

***Intrinsic*** It was only in 1997 when Professor Bruno S. Frey for the first time introduced the concept of intrinsic incentives into the realm of economics. Meanwhile, it was nothing new for not-for-profits – both public and nonprofit organizations – because they have been always disproportionally relying on employees who are internally motivated by their deep-seated feelings and attitudes (Leete 2000). Different from for-profit sector, nonprofit employees are more motivated by factors such as individual growth as a person, opportunities to learn versus more ambition that better describes private sector employees (Schepers et al. 2005). Janssen et al.'s (1999) conducted a large study of Dutch nurses showing that intrinsic work motivation is positively related to the quality of the job content that makes the job challenging and worthwhile, for example, skill variety, autonomy, social contacts, and opportunities to learn.

Apart from the possibly to be intrinsically motivated by job content, the nonprofit organizations

offer a unique opportunity for its workers to derive intrinsic motivation from its organizational mission (Devaro and Brookshire 2007). Thus, prosocial motivation in nonprofits could be realized simply by being involved in organizations' activities and management, regardless of a position occupied or task performed. The research in the United States indeed supports that nonprofit employees display stronger motivations linked to the meaningfulness of their work, despite lower pay, shortages of staff and resources, and excessive workloads (Light 2002). Opportunities to participate in prosocial activities also attract volunteers, whose motivation is beyond the scope of this entry (see a separate entry on ▶ "Volunteer Motivations and Nonprofit Organizations" in this encyclopedia).

As just mentioned, intrinsic motives are usually built upon other-regarding aspects like the social usefulness of the job and a contribution to society. However, their intrinsic motives could also have a self-related focus like, for instance, an opportunity for self-fulfillment.

A nonprofit organization cannot offer direct incentives for the improvement of intrinsic motivation. Yet, it could create an organizational environment that is favorable to employees' intrinsic motivation. Such indirect incentives are similar to extrinsic nonconsumption goods and include opportunities for professional development, decision-making autonomy, variety and creativity of job tasks, and recognition of employee's contribution. It is important to mention that some employment opportunities in nonprofit organizations might offer a weak set of certain important intrinsic rewards. For example, organizations whose mission is to assist children or dreadfully sick individuals have a limited opportunities for a continuous development of a human being through the meaningful communication with other adults. Meanwhile, the lack of these motivational incentives might be balanced by other-regarding rewards such as perceived social usefulness of work.

## Public Service Motivation

To better understand motivational structures in nonprofit organizations, De Ridder et al. (2012) recommend to analyze their Human Resource (HR) architectures. They suggest that all organizational priorities in public benefit organizations – especially in nonprofits – could be aligned along the two dimensions: first, the mission of an organization and, second, the development and well-being of its employees. Both dimensions are important for nonprofit organizations considering that employees in these organizations have higher levels of public service motivation. In a broad sense, public service motivation (PSM) is the desire to help others and to act for the benefit of society. The question is whether the organizational structure and, especially, its HR programs and practices allow the staff to fulfill their intentions by practicing them at work. The organization, which prioritize the extreme ends of each dimension, is under the threat of certain pathologies like overemphasizing the mission at the cost of employees' development or, on the contrary, satisfying employees' needs before ensuring the success of the mission.

Public service motivation is a rising concept in nonprofit research and practice. While PSM has already been used to characterize the public sector already for several decades, it is only recently that this unique motive has found its popularity in studies of nonprofit organizations and in comparatives with other private enterprises. The main assumption under this concept is that non-for-profit employees value contribution to society more than for-profit employees and that was proven by a number of studies across the globe. As a result, because this prosocial intrinsic motivation aligns with the prosocial mission of public serving institutions, person-organization fit is especially high in non-for-profit sector (Devaro and Brookshire 2007).

## Job Satisfaction

Comparative research of nonprofit and for-profit organizations in the United Stated and the United Kingdom showed that nonprofit employees are more satisfied with their jobs than their business counterparts (Benz 2005). But why is it important for a nonprofit manager to care about employees' job satisfaction? Mainly, because satisfaction

measures are widely recognized as suitable proxies for utility. On the individual level, satisfied employees are happier employees. These motivated nonprofit employees seem more willing to "donate work" and are more loyal to their organization than workers in other sectors (Borzaga and Tortia 2006). Therefore, on the organizational level, the work effort resulting from job motivation leads to improved production and client satisfaction.

The formula of job satisfaction can be easily visualized as the following:

$$Motivation + ProperIncentives = Job\ Satisfaction$$

An organization is likely to influence job satisfaction of its employees through implementing an incentive system that properly corresponds to employees' motivation. Motivation is important, because it influences workers' overall satisfaction with their jobs (Borzaga and Tortia 2006). Workers who are driven, for example, by the desire of self-fulfillment and better relations with colleagues may be more satisfied, given their proactive attitude toward work (Borzaga and Tortia 2006). Nonprofit organizations have a clear advantage in this area. They score highest on all items of process-related incentives – meaning organizational culture and values – when compared to public and private organizations. Nonprofit employees have more opportunities to express themselves freely at work, while hierarchy that affects spontaneous involvement and autonomy is likely to characterize public bodies and for-profit firms.

## Antecedents of Job Satisfaction

***Intrinsic*** Because motivation is significantly related to job satisfaction, in nonprofit organizations, certain level of job satisfaction would occur simply through the involvement in the mission realization. Employees have been satisfying their intrinsic motivation by joining a nonprofit organization of their choice, primarily because of their deeply rooted believes. From that perspective, managers do not have a strong influence on job satisfaction that derives from these intimate feelings. While organizational values could mold individual behavior and influence their preferences, that change would cause at least temporal dissatisfaction. On the contrary, the closer the correspondence between individual preferences and organizational behavior, the greater the probability of employees' satisfaction with their job.

In nonprofits, worker satisfaction is often higher than in other organizational forms, even in the presence of lower wage levels (Benz 2005). The fact of thriving job enjoyment despite the low levels of monetary remuneration is found for nonprofit workers in different countries (Borzaga and Tortia 2006). For example, in the United States, they exhibit higher satisfaction linked to the meaningfulness of their work, despite lower pay, shortages of staff and resources, and excessive workloads (Light 2002).

The perceived meaningfulness of the work, and thus, job satisfaction, also increases as an employee moves up the hierarchical ladder. Thus, research shows that employees in Italian social nonprofits are the most satisfied with career advancement than their colleagues in public or private organizations, because nonprofits are more dynamic and many of their workers expect to reach high levels in the hierarchical structure (Borzaga and Tortia 2006).

Job satisfaction level in a nonprofit organization could also depend on the structure of organizational interaction, for example, whether the employees are in constant contact with adults or with children, as mentioned in the examples of the previous subsection. Along the same lines, the study of employees in Italian social nonprofits also reveals that the workers are highly satisfied with their relations with volunteers, who are rare in for-profit firms and public agencies (Borzaga and Tortia 2006).

***Extrinsic*** While there is a crucial role of intrinsic motivation in the nonprofit sector, extrinsic factors should not be neglected. A common misbelief

is that "a nonprofit" means an organization that is not supposed to make profits and thus, it has a good justification for not paying its employees treating them as unpaid staff, or paying below the market average for a similar position in the private sector, or providing less benefits than public organizations. Usually, satisfaction with economic and process-related aspects of a job has the greatest impact on loyalty to not-for-profit organizations. Meanwhile, as studies in Italy show, nonprofit workers in social services driven purely by economic interests are less satisfied (Borzaga and Tortia 2006).

Yet, indeed, the employees of the nonprofit sector are more likely to receive their satisfaction from the person-job fit, because they are driven by public service motivation. From that perspective, limited extrinsic rewards in nonprofit organizations could, indeed, be justified by the fact that those employees have been already satisfied with what they do, and matching their extrinsic motives is about adding up to the satisfaction that has been already present. In comparison, in business organizations, extrinsic incentives could be the only stimulus that moves their work force. To balance wage gaps with the business sector, management of nonprofit organizations could pay more attention to other consumption and nonconsumption extrinsic rewards. For instance, workers in Italian social cooperatives are the least satisfied with the wage, but are more satisfied in the case of working hours (Borzaga and Tortia 2006).

Nonprofit managers can manipulate job satisfaction derived from extrinsic rewards through modification of the incentives much easier than that derived from intrinsic motives (Schepers et al. 2005). This is when the incentives management comes into play, because it is easier to come up with the ways how to meet workers' monetary drives. Also on nonconsumption extrinsic side, as studies show, nonprofit organizations could establish clear definitions of tasks and roles for each employee to increase their job satisfaction (Lee 2016).

Meanwhile, it is much harder for an organization to address employees' intrinsic motives, because the workers themselves sometimes cannot explicitly articulate these inclinations. First, they might occur only on a sub-conscious level. But also, even when it is possible to clearly visualize them, employees might feel ashamed to speak out loud, because of the fear of being criticized or not accepted into a work team. This situation is especially true, when the desires of an employee do not fall along the popular for nonprofits lines of self-sacrifice.

It is important to remember that when pursuing their objectives, managers tend to design incentive mixes that are able to satisfy employees' motivations at the lowest cost to an organization. Despite the numerous ways in which an organization could improve employees' satisfaction with the work they perform, it should be kept in mind that from the economic perspective, an organization will provide those incentives which are produced at the minimum cost (De Ridder et al. 2012).

## Outcomes of Job Satisfaction and Dissatisfaction

Satisfied workers are more loyal to their organizations. This reduces employees' turnover and faster creates a high level of trust among them. On the other hand, there are a lot of drawbacks for employees, when they try to derive job satisfaction from socially oriented work. For instance, in Janssen et al.'s (1999) study of Dutch hospitals, at some point, nurses started to experience diminished intrinsic motivation, occupational burnout, and an inclination to leave the job.

Also, it is important to remember that motivation and satisfaction function in a loop when a new wave of motivation arises from a new wave of job satisfaction. It emerges when the characteristics of jobs cause critical psychological states: they allow employees to experience the meaningfulness of their work, allow them to feel responsibility, and share with them the results of their work efforts (Schepers et al. 2005).

There are two additional things to keep in mind when studying employees' satisfaction. First, not all motivation incentives will lead to employee satisfaction. For instance, as the study of

Canadian nurses showed, autonomy as antecedent of work motivation was connected through self-esteem and did not necessary cause job satisfaction (Edgar 1998). Second, according to the Herzberg's two-factor hygiene theory and as proved by the follow-up studies, factors that rise satisfaction and dissatisfaction are not mutually exclusive (Schepers et al. 2005). Thus, satisfaction and dissatisfaction are not at the opposite ends of the same continuum. However, dissatisfiers usually distract from the core activity that leads to satisfaction.

## Conclusion

The entry discussed the mechanisms of work motivation and employee satisfaction as well as their mutual complementarity. While there is a motivation-satisfaction loop inside of each employee's head that is based on her individual intrinsic incentives, the extrinsic role of an organization is also very high. Meanwhile, research from different parts of the world shows that incentives provided by an employer cause different reactions of nonprofit employees that of those working for a business firm. Specifically, a nonprofit employee has an opportunity to derive internal satisfaction and motivation from a unique bond with the mission of a nonprofit organization. This incentive suggests a particular work environment in a nonprofit enterprise, where its employees could fulfill their public service motivation, leading to the behaviors that benefit society.

Most of the studies cited in the encyclopedia entry focus on no more than one element of the incentive structure. From that perspective, more studies about nonprofits should take place, especially, taking into consideration a high diversity of services provided within the sector.

# Joined-Up Governance

Niaz Ahmed Khan and Kazi Mysha Musarrat
Department of Development Studies, University of Dhaka, Dhaka, Bangladesh

## Introduction

Ever since the Treaty of Westphalia was concluded, rights of the nations for self-determination and good governance had always been honored and upheld. The treaty was regarded as the concept of coexisting sovereign states maintaining stable balance of power at one hand and efficient and optimal national governance at the other. So pervasively universal was the influence of the treaty that it became the most accepted legal instrument in the observance of international law and prevailing world order. On the other hand, national governance has always been regarded the core and central theme of the political science. Political scientists from Aristotle to Machiavelli had evolved concepts and suggested methods to ensure seamless governance of the nations in the most efficient manner. That is why the efforts and research for public reform had always been dynamic and evolving continuously shifting its focus from delivery to quality of service. Continuous research by the governance practitioners and academia to address the inefficiency in the system of governance and in improving the pattern of delivering public service through innovations and identifying newer and powerful concepts were focused to create decentralizing agencies capable of responding flexibly to the demand of general population across a broad range of cross-cutting issues. In the early 1980s, consecutive governments of the United Kingdom introduced a range of measures to break up what was believed to be monolithic, inward-looking public with the objective of improving efficiency and responsiveness of the government. Joined-up governance describes a strategy that aims to coordinate and implement policies across government structure. Subsequently, joined-up governance began to be accepted as a concept and was being practiced and implemented in the United Kingdom during the late 1980s and early 1990s. Joined-up government was a major element of British government during the first Blair government, and it has rightly attracted a great deal of attention. Joined-up government is best seen as a strategic response to both the weakness of conventional public administration and the fragmentation that was experienced in the 1980s. This is done by developing cooperation and coordination mechanism and tools that link up efforts at local, regional, and international level as well as different government sectors. Joined-up governance involves not only government departments and agencies but also independent bodies and civil societies to work across organizational boundaries toward one common goal of delivering service. Not only the United Kingdom, other developed counties like the United States, Canada, Australia, New Zealand, and the Netherlands also embraced and implemented the concepts of joined-up government in their countries with varying degree of success. This article explores and elaborates the concept of joined-up government and examines its validity and relevance by tracing its genesis and comparing its advantages and challenges along with its success of implementation in different countries of the world.

The concept and connotations of joined-up governance has evolved from and complements the whole of government management. Thus, joined-up governance is the product of robust planning and the exploitation of the entire set of governmental pathways, and it is also the product of strategic partnership beyond government in terms of design and delivery. It complements top-down policy making with the "horizontal whole" of governmental policy, vertical intergovernmental policy, and government approach. It is best viewed as a group of responses to the perception that services had become fragmented and that this fragmentation was preventing the achievement of important goals of public policy. This perception grew in prominence in the mid-1980s and has remained an important part of the thinking behind public sector reform. It is based on the view that important goals of public policy cannot be delivered through the separate activities of

existing organizations, but neither could they be delivered by creating a new "super agency." It therefore seeks to align the activities of formally separate organizations toward particular goals of public policy. Therefore, joined-up working aims to coordinate activities across organizational boundaries without removing the boundaries themselves. These boundaries may be interdepartmental, central local, and sectoral (corporate, public, voluntary/community). To join up, initiatives must align organizations with different cultures, incentives, management systems, and aims.

## Genesis

From at least the mid-1970s, changing pressure on public services challenged what had come to be regarded as the conventional delivery of public services (Ling 2002). As per Ling, this pattern of delivering public services was seen to be insufficient with a succession of official reports and politician's speeches highlighting its supposed deficiencies in the general areas of civil services, local government, financing, and management and the specific areas such as urban policy, education, housing, and social work (Ling 2002). The debate about the "crises of the state" which started in 1970 did manage to capture the sense that continuing with the organizational status quo was not an option for the public sector. Thus, the government in the United Kingdom began to experiment with the concept to create decentralized agencies which created a degree of fragmentation in the United Kingdom and also in other countries. As a result joined-up government came into discussion in the 1980s not only as response to the weakness in the conventional delivery process but also as a response to the perceived problem associated with fragmentation during the 1980s. The cabinet office of the British government was central in rethinking the delivery of public services. At the heart of the strategy of the cabinet office, there were mainly two principles which were aimed at inclusiveness implying forward-looking policies and implying integrating policies and program between local and national organizational structure of the government. The cabinet office of the British government showed extensive and sincere interest to joined-up government by addressing the skills, budgeting arrangements, and leadership style that would be needed to facilitate joined-up governance. Other important department of the British government like the Treasury also made deliberate efforts to promote joined-up working through the public service agreement by identifying the crosscutting aim of the department to improve productivity in the public sector. Audit services of the British government also embraced the concept and launched many initiatives to improve public services.

## Acceptance of the Concept by Wider Community

In the above context, joined-up governance was accepted with enthusiasm in many different contexts in many different ways. Many of the developed countries embraced joined-up government and practiced in their own contexts. Although the concept of joined-up governance originated in the United Kingdom, many different developed nations around the world, like the United States, Canada, Australia, and New Zealand, are some of the countries where joined-up governance was accepted as a modern concept of governance and was practiced. Along with the interest of the British government for the joined-up government, the concept also excited the wider academic community. Clarke and Stewart (1997) argued that urban policy of the British government provided a fertile policy arena where discussions about joined-up government began to take root. Coinciding with the rise of new labor, there was a growing acceptance of a claim that there were qualitatively new problems developing which required innovative approach to public services. This resonated with the emerging third way claim that new labor saw at once as a radical departure from the conservative government and pragmatic response to the problems of the day. Clarke and Stewart (1997) identified some of the wicked issue which requires holistic thinking and a new style of governance

which has the capacity to think and work across organizational boundaries and employ innovative ways of involving the public in developing responses. Clarke and Stewart were not alone in making the claims that joined-up government implies a new style of government; many other political scientists and thinkers also endorsed these views. *Leat, Seltzer, 6 and Stoker* claimed that this epoch will continue well into the first decade of this new century (Stoker et al. 1999). Similarly Rhodes suggested that there has been a shift away from top-down government toward governance where power is more dispersed (Rhodes 2000). He argued that this implies a change in the way public services are delivered. In summary he argued that we have seen the emergence of a class of problems whose causes are so complex and whose solutions are so multifactorial that they require multiagency response. The spatially and functionally fragmented, professionally dominated, bureaucratic model accountable vertically to a minister suddenly seemed old-fashioned and ripe for modernizing. It can thus be seen that much of the political science literature complimented the claim that models of public service delivery should change profoundly. These mostly suggest that the new model (joined-up government) was simply a necessary response to a wider change (Clarke 2000). Much of these literatures did draw on the concept of governance to examine this shift (Stoker 1998). Although the term governance was not used consistently (Pierre and Peters 2000), among other things, it did gesture toward new types of public-private partnership where flatter relationship would exist between organization having a blurring of boundaries and previous distinct function aiming to execute new ways of managing the consequential partnership.

## Objectives and Purpose

Joined-up government is about aligning agencies and in some cases individuals and their communities and orienting them toward shared goals. At the core of all joined-up governance approaches lies coordination which is an effective tool for efficient planning, implementation, and monitoring. The concept on the one hand provided information to the community that understands their values and concerns and invites them to participate actively in public decision-making. Main objectives of the joined-up government are summarized below:

(a) Ensure access to government services is seamless rather than fragmented and friendly for the individual and society.
(b) Institute measures to eliminate situations where policies undermine one another.
(c) Using resources better.
(d) Launch deliberate efforts to create synergies through partnership between stakeholders from different levels and organizations.
(e) Ensure participation of all concerned stakeholders on all the public policy areas.

## Principles

Joined-up government is the product of a strong planning context and the exploitation of existing policy pathways. Top-down policy making is complemented by horizontal whole of government policy, vertical intergovernmental policy, and bottom-up participating governance, which draws the community into the policy design delivery and evaluation. Top-down policy making has the benefit of authority; centrality has the benefit of error agency cooperation, collaboration, and data sharing. Vertical intergovernmental process has the synergistic potential to scare resources into improve integrated outcomes. Bottom-up participating governance brings the community into policy development.

Joined-up governance describes a strategy that aims to coordinate and implement policies across government structure. This is done by developing cooperation and coordination mechanism and tools that link up efforts at local, regional, and international level as well as different government sectors. Joined-up governance involves not only government departments and agencies but also independent bodies and civil societies to work across organizational boundaries toward one

common goal of delivering service. Some of the major principles that are necessary for the coordination of a joined-up approach are shown below:

(a) Joint commitment and mutual recognition. Each sector/level of government is politically committed to joined-up governance. Each sector/level is also aware of and explicit about its positions and roles and those of other sectors/levels.
(b) Division of responsibilities. The responsibilities for policies and actions are effectively distributed between and within levels of governance, avoiding duplication of interventions and ensuring that the rights of all individuals and groups are taken into account.
(c) Sharing resources. Coordination requires that resources are adequately distributed between levels of government. When competences are developed to local and regional authorities, it is of vital importance that state governments also provide the material resources for their effective exercise.
(d) Sharing and spreading information. Information must be regularly circulated among all levels and sectors of government. Such routines avoid overlap implementation. Information sharing also makes it more possible to address lapses or gaps.

## Various Dimensions

Since the practices associated with joined-up government are wide, ranging it would be appropriate and pragmatic if the total concept is discussed and organized from differing dimensions. The concept can be validated and evolved from the dimension concerning the internal life of each of the sub-organization along with the issues concerning the interorganizational life covering shared leadership, pooled budget, and merged structure. Other dimension covered the aspects of delivery of services incorporating joint consultation with clients for developing a shared focus in order to promote a contended client along with other important issues accommodating accountability upward and target setting from above. These can ensure effective public and private partnership which would be able to deliver efficient public service. Partnership is at the center of joined-up government which offers prospects of securing greater value for money through the coordination of activities.

Hood (1992) identified the problem arising from modern government becoming multi-bureaucratic, where in the process of "policy delivery" can become increasingly complex and the manipulation of the overall system from the center can become much more difficult to achieve and dangerous to the system's professed values. (Hood 1982).

### Selected Examples and Global Practices

Although the notions of joined-up government are derived from the United Kingdom, its principles are universal and accepted by many of the developed nations. Experiences of the practice of joined-up government by some of the developed countries are enumerated in the succeeding paragraphs.

**Australia**: In Australia, the three main types of joined-up working were practiced: firstly between the federal and state governments, secondly between officials providing similar service across the country, and thirdly partnerships between public and private sectors. Their joined-up system was mostly top-down until the 1990s. The need for joined-up working was accepted both centrally and locally. For example, central government had led a coordinated response to external trade pressures and international agreements, and locally it had been able to deliver information to the public more efficiently. Officials had benefited from receiving technical and practical information. However, there were obstacles which included maintaining of secrecy which resulted into suspicion from the public and weakly developed cross-cutting measurement leading to inefficient performance management.

**Canada**: In Canada joined-up working was practiced in two methods, firstly, between the federal government and the local states and territories and secondly, between all the departments. The round of public sector reforms initiated by the "program" which was reviewed in 1994 made it

possible for public services to share their resources. These have contributed to a significant increase in joined-up governance. Performance targets were also used to coordinate joined-up working. Cross-cutting performance targets were found to be helpful. For example, the Great Lakes 2000 initiative brought together Environment Canada, six other federal ministries, and four Ontario Province ministries. It used 50 performance targets for environmental and health improvements. But the initiative had some obstacle also. The decision-making was observed to be often hidden from the public, and poor-quality information made performance management less effective.

**The Netherlands**: In the Netherlands joined-up government was extended in three directions, firstly between the central and the local levels of government (e.g., the Ministry of Home Affairs promotes modernization in local government), secondly between government departments (e.g., the cabinet's annual interdepartmental reviews), and thirdly between "social partners" (e.g., in advisory groups). The Netherlands had been successful in many respects. Successes were associated with low strike rates, the successful management of rising welfare costs, and the management of difficult ethical issues such as abortion. However, involving many partners in decision-making and in delivering services has also made coordination difficult for the government.

**New Zealand**: With a relatively small and centralized system of governing, joined-up government in New Zealand had mainly involved coordinating central government departments to provide joined-up services on the ground. For example, Strengthening Families aims to improve the well-being of families, and it was supported by the Ministries of Health and Education, the Ministry of Social Policy, and many other central agencies.

The use of strategic priorities and overarching goals was a bold attempt to coordinate joined-up working. In areas such as care for older people, it had helped to bring agencies together at both national and local levels. However, the impact of this on the work of departments was often limited. Strategic priorities only partly determined the way departments work.

**The United States of America**: Joined-up government in the United States was first of all between the federal government and the state governments. For example, the Federal Executive Boards did spread best practice throughout the public sector. The states had independent powers in many areas and shared responsibilities in others. The United States provided a wide variety of joined-up working experience with each state often finding new ways of delivering services. However, with so many programs, and new programs being developed all the time, it was often difficult to measure success.

## Obstacles and Challenges

While joined-up governance appears to be logical and desirable, its effective implementation hinges on overcoming a number of challenges. It has been seen that the lack of coordination and cooperation among different sectors and levels of government can hamper an effective government response. Following issues can limit or undermine joined-up approaches of the government:

(a) **Lack of cooperation in the implementation between levels of government**

Sometimes it is not easy to apply legislation or mainstream policies throughout all levels of government. Challenges arise due to poor cooperation and coordination among different levels of government. The result is that local and regional authorities are insufficiently involved in the planning, implementation, and monitoring. Consequently, local and regional authorities may not achieve best result desired by the government.

(b) **Lack of consideration of the division of responsibilities among levels of government**

Very often national level decision-making bodies fail to account for local and regional level action properly and vice versa. Failure to take account of the distribution of responsibilities between different levels, and/or resource allocation that does not match these responsibilities, may lead to insufficient attention to the service delivery at the local level.

(c) **Lack of training in accomplishing the priority task of the government**

The important role of public employees those working in the government sectors are

generally underestimated. The result is that public officials are not given the training necessary to align their day-to-day work performance in public service delivery. It is especially important that public officials acquire the knowledge and skills to discharge their duties to contribute to deliver service.

(d) **Limited cooperation with civil society organizations in the field**

Civil society organizations often possess firsthand knowledge on ground as they tend to have more direct access to ongoing activities. With their community links, they are often better equipped to reach out to population. Therefore, these organizations can be important partners enabling the public sector to fulfill their duty for better governance.

## Advantages: The Case for a Joined-Up Government

The benefits of joined-up governance reached everyone when public authorities at all levels work in a coordinated, comprehensive, and integrated manner. It is also more likely that this coordination might help avoid misguided interpretations and downward prioritization to provide better services to the public. A number of advantages may be attained by joining up governance which are enumerated below:

1. **Improving results**: When policies remain sectorial, their reciprocal influence and possible contradictions are often poorly considered and evaluated. Tensions between different policies emerge and often remain unresolved.
2. **Avoiding error**: Joined-up governance requires policy makers to first identify and analyze issues within their sphere of influence. These considerations must take place at the initial stage of the policy process.
3. **Encouraging innovation**: As actors at all levels and sectors coordinate their planning and action, they are more likely to get fresh inputs and ideas and create new policy instrument and methods.
4. **Raising awareness**: The more public officials on all levels work with a joined-up approach, the more they become conscious of the many ways in which their work standard can improve.
5. **Enhancing accountability and transparency**: There is a need to monitor and report on achievements and failures of all policies, to find out whether and to what extent public authority operations live up to their aims. This increases accountability of officials and departments and enables individuals to hold public officials accountable for policy implementation (or non-implementation).

## Epilogue

Modernizing government represents a significant change in the public service environment, and its successful implementation will require new ways of working. The goal of achieving more efficient and effective delivery of public program is one that is shared between public sector managers and also general public. This requires a significant and acknowledged shift in civil service culture as well as change in career structure across the public, private, and voluntary sectors. The government has repeatedly reiterated the theme that joining up requires both a change in leadership style and whole change of culture (www.cabinet-office.gov.uk/innovation/2000/winning/). Joined-up government is the product of a strong planning context and the exploitation of existing policy pathways. Joined-up government was a major element of British government during the first Blair government, and it has rightly attracted a great deal of attention. Although the motions of joined-up government are derived from the United Kingdom, its principles were universal and accepted by many of the developed nations. It is best seen as a strategic response to both the weakness of conventional public administration and the fragmentation of 1980. Despite all the shortcomings, joined-up governance is promising. It is a product of a strong and articulated planning process. Although this concept initiated from Great Britain, its application can be used worldwide with success. The principles and practices of joined-up governance are definitely worth considering. The government can be benefited through a proper usage of the cross agency cooperation, collaboration, and data sharing. Only a

well-planned and structured, adequately resourced, properly managed, and visionary leadership can ensure the success of joined-up governance.

## Definition

*Punctuated equilibrium theory* "addresses both incremental and large budget changes. It asserts that there is a state of equilibrium followed by a punctuated change followed again by equilibrium" (Jordan 2002, p. 202). The *Hashemite Kingdom of Jordan*, known as Jordan, is a Middle Eastern country located in the Levant. Its official currency is the Jordanian dinar, which equals US dollar 1.41. Jordan is an upper-middle-income country.

Decades after Key's (1940) idiosyncratic question about the efficient allocation of public resources, his argument on the lack of budgetary theory causes economists and policymakers to desperately try to find an answer to "on what basis shall it be decided to allocate X dollars to activity A instead of activity B" (p. 121). However, finding an equation or theory to address Key's question has resulted in numerous arguments to date because each country and each state have different criteria and an uncertain environment. From a different perspective, Straussman (1985) commented on Key's idea that there is a failure in economic theory and incremental theory in addressing this question, and he argued that if the budgeting process is a political matter, it is difficult to find a unifying formula for public resource allocation.

The purpose of governmental preparation of public budgeting through allocation and distribution policies is to reduce inequalities and improve the welfare of citizens. However, there are numerous factors that influence the decision process, for instance, economic conditions, ideologies, and unprecedented events such as natural or man-made crises. Therefore, understanding public budgeting is accomplished through economic, management, and political science (Caiden 1990). In this chapter, through the political science lens, we employed the incrementalism and punctuation equilibrium theories. These theories are mutually exclusive, so the existence of one theory would lead us to refute the other one as a theoretical theme of our analysis context and time period.

In essence, the incremental and punctuation equilibrium theories describe the dynamics of government allocation of resources. Some scholars have argued that the punctuation equilibrium theory can be used to explain the budgeting

decision-making process, taking into account the environmental factors (True et al. 2007). It demonstrates how the unsteady political environment and the availability of resources lead to sudden policy breaks in incremental trends (Guragain and Lim 2019). In terms of the strengths of punctuation equilibrium and the pitfalls of incrementalism, Bozeman's and Strussman (1982) incremental theory is less capable of addressing the uncertainty and radical changes in the budgeting decision-making process. The incremental and punctuation equilibrium theories have been extensively explored by economists and public budgeting and policy science researchers, who applied it to democratic and industrial states in European countries and the United States (the second section below discusses part of these studies). However, very few studies have investigated public budgeting theories in developing countries and authoritarian regimes. Thus, this chapter is an expansion of the existing literature on punctuation equilibrium theory with an emphasis on current and capital expenditure in Jordan as a developing and authoritarian state (According to Democracy Index).

Briefly, Jordan is a relatively small country with limited resources that lies in the Middle East region. It gained its independence in 1946 (Sorenson 2018). Jordan is an absolute monarchy with a crown and legislative authority including a council of deputies and house of senators, and the prime minister is appointed by the king and confirmed by the legislature (Jreisat 2017). According to the latest census in 2015, the Jordanian population is 9.5 million (Alshoubaki and Harris 2018). Jordan is challenged by political and economic pressure, such as economic hardship, population boom, high unemployment rate, budget deficit, and limited natural resources (Jreisat 2017). In terms of the governance structure, Jordan faces a fluctuation in the state structure and administration; for example, since its independence, Jordan has appointed 42 prime ministers and was significantly influenced by the International Monetary Fund and World Bank in its fiscal policy and development programs (Jreisat 2017; Massadeh 1999). The turbulent environment in the Middle East has imposed an extra burden on Jordan. For example, the 1967 Arab-Israeli War caused 300,000 Palestinians to seek refuge in Jordan and resulted in military expenses and the loss of the West Bank and Jerusalem, which constituted a quarter of Jordan's gross domestic product (Sorenson 2018). This was followed by the civil war in 1970, which was popularly known as Black September, the economic crisis in the 1980s, and the first and second Iraq invasions and loss of the east borders. Lastly, the Arab Spring and the ferocious civil war in Syria resulted in an influx of 1.2 million Syrian refugees (Sorenson 2018). Moreover, Jordan has an authoritarian regime that relies on the tribal system to keep balance of power in the social context; however, since King Abdullah II came to power, Jordan has accomplished notable progress toward liberalization (Bellin 2004).

To come to a clear understanding of the hallmark theme of the dynamics of national public spending, we sought to examine the distribution of annual changes in Jordanian total public expenditure between 1964 and 2017. We also split the functional spending into current expenditure and capital expenditure to determine which type of spending is prone to punctuation.

This chapter is organized as follows: in the next section, we discuss the theoretical perspectives of the chapter. Then, we present the data and method. In the third section, we demonstrate the key results, and in the last section, we provide the chapter conclusion.

## Theoretical Perspectives

### The Foundation of PET

The incrementalism theory was the prevailing budgeting paradigm in the 1960s and 1970s. It was developed based on the muddling-through theory and bounded rationality of decision-making process that makes sequential limited comparisons rather than comprehensively comparing all alternatives at once (Lindblom 1959). The policymaking process is affected by decision-makers' intellectual capacity and available information to choose satisfactory alternatives (Simon 1957). Wildavsky (1964) asserted that

budgeting is incremental in nature because policy decisions are made in the narrowest sense; a budget is prepared within strict constraint adjustments. The incremental approach simplifies the budget preparation process by considering the spending of the previous year, and any increase or decrease in spending is allocated proportionally (White 1994). However, some scholars question the ability of incremental theory to address the dynamics of public budgeting preparation. Berry (1990), for instance, argued that incrementalism is depleted as a concept and cannot be utilized in all cases; therefore, there are exogenous factors leading changes in the base, and the incremental approach reduces innovative decision-making. Caiden (1989) claimed that incrementalism is insufficient to use in cases of uncertainty and crisis. She provided the nuclear weapon dilemma as evidence of the failure of incremental theory to discuss massive and collective problems. Along the same lines, Leloup (1978) pointed to the influence of politics in changing the base in preparing the public budget; he considered political bargaining to lead to diminishing the relying on the base. Bozeman and Straussman (1982) noted that incrementalism was unable to deal with economic fluctuation during Regan's administration and cannot successfully accomplish spending cuts; they called for adopting a top-down approach. Alternatively, Baumgartner and Jones (1993) established the concept of punctuation equilibrium to explain incremental and large budget changes.

Punctuation equilibrium describes a complex policy process through the combination of information processing and bounded rationality principles; it explains the sudden policy shifts that might occur during a long period of stasis (Baumgartner and Jones 1993). The notion of the punctuation equilibrium theory in public budgeting was built upon evolutionary change and borrowed from biological science to address the stability periods that are broken by radical changes (Cairney 2012). Punctuation equilibrium theory accomplishes prolific advantages in terms of understanding the policy changes in the current turbulent environment and fluctuating political climate and information profusion that go beyond the abrupt changes due to political rational choice perspectives (Theory of democracy (Downs 1957)), but the uneven information processing leads to ignoring significant indicators of problems before governmental action (Eissler et al. 2016). Eisser et al. (2016) asserted that punctuation takes place in any phase of policy process and that it is not, as previously perceived, an agenda-setting approach, and conditions push a window of opportunity to create a large change only. Koski and Workman (2018) investigated information processing and policy change and provided practical lessons under the arch of the punctuated equilibrium theory concept. They cautioned about the negative impact of centralization in solving problems of information search and the importance of numerous venues to enhance citizens' participation and influence.

Czapiewski (2015) claimed that punctuation equilibrium can be utilized in analyzing the policy changes in political systems and political parties and focusing on modern democracy's influence not only in the United States but also in European countries. By investigating the work of Czapiewski (2015), researchers examined the strengths of applying the punctuation equilibrium theory in European countries. Princen (2013) studied the principles of this theory in the European policy process and found that punctuation equilibrium theory provides a systematic way to understand the policy process, facilitates the comparison between European political systems and others, and demonstrates the interaction between institutions and policy development. Punctuation equilibrium theory is pertinent to different realms, such as foreign policy and public budgeting. Joly and Richter (2019) investigated the relationship between changes in allocation of foreign aid and administration size; they concluded that the allocation of foreign aid coincides with punctuation equilibrium and addressed the reasons for changes in policy issues in the political agenda.

## PET in Public Budgeting

As a point in this chapter, we employed the punctuation equilibrium theory to address changes in public budgeting. True (1995) deployed Baumgartner and Jones' (1993) theory

to define the change in public expenditure and found that the drivers of sudden change in spending were the Great Society, Cold War, and military group stockpile. Moreover, Jones, Baumgartner, and True (1998) studied the policymaking process in the United States since 1945 through the percentage change in congressional budgeting and concluded that punctuation happened in programs and subsystems of the US government. Generally, punctuation in the budgeting process happens in an inconsistent decision environment and volatile political atmosphere that leads to a break in the existing state of affairs (Guragain and Lim 2018). At the state level, Breuing and Koski (2006) investigated the incrementalism and punctuation equilibrium in the public expenditure of 50 states from 1984 to 2002 at the functional level; they observed different degrees of punctuation. The occurrence of punctuation is not an absolute fact in federal government; for example, Robinson and Caver (2006) compared the congressional budgetary changes in the period between 1947 and 1975 to congressional budgetary changes in the period between 1976 and 2000; they found very weak evidence for the fitness of the punctuation equilibrium theory.

The generalizability of the punctuation equilibrium theory makes it possible to apply not only at the federal and state level but also at the local level and internationally. To demonstrate, Jordan (2003) examined the decision-making process in local government by analyzing differences in distribution. She discovered that spending distribution fits the punctuation equilibrium theory. By the same token, Kovari (2016) showed the punctuation in the operating and capital spending of Wisconsin's counties, cities, towns, and villages over 19 years. A study by Baumgartner, Foucault, and Abel Francios (2006) indicated that French national budgeting since 1820 has exhibited large breaks from equilibrium norms. The results were similar to the high leptokurtic distribution in the United States budgeting in Jones and Baumgartner's (2005) landmark study.

### PET in Different Governmental Systems

Sebók and Berki (2017) sought to determine the punctuations in Hungarian public expenditure from 1991 to 2013. They found consistency between the distribution of change and punctuated equilibrium theory. The researchers expanded their analysis a year later to offer an insightful explanation for the interruption in Hungarian expenditure between 1868 and 2013 based on the political regime influence and the comparison between democratic systems and autocratic systems. As noted, most studies on public budgeting punctuation equilibrium have focused on big industrial and democratic countries. There is a lack of punctuation equilibrium literature in the context of developing and authoritarian states. In this chapter, we reviewed relatively recent studies assessing the abrupt change in public expenditure in developing countries. The first evidence was from Brazil. Rey, Epp, and Baumgartner (2015) studied the impact of the democratic transition on public expenditure by comparing the distribution of annual change before and after democratic government and interpreted it according to Organization for Economic Cooperation and Development country factors. Moreover, Guragain and Lim (2018) found that public budgeting in Nepal witnessed several changes that caused a break in the incremental flow of the budgeting process.

Indeed, researchers have found shreds of evidence of punctuation equilibrium in public budgeting and proven the applicability and generalizability of its perspectives; however, no theory has been spared from criticism. For example, Givel (2010) critiqued the punctuation equilibrium theory from different dimensions. He pointed to the misuse of the metaphor of evolutionary change because there are differences between biological and public policy punctuation concerning "time frames for change, what constitutes outside disturbances of equilibrium, venues of punctuated equilibrium, level of analysis for change and patterns of change" (Givel 2010, p. 187). Givel (2006) suspected the ability of the punctuation equilibrium theory to indicate the punctuation in some policies, such as the US State Tobacco Policy, Pacific Northwest Forest Policy (Cashore and Howlett 2007), and US Federal Auto Efficiency Policy (Perl and Dunn 2007).

## Data and Methods

In this chapter, we examined the distribution of annual change in national public expenditure in Jordan between fiscal years 1964–1965 and 2017. The data source was the Jordanian Ministry of Finance; data were provided to us directly, in person. Our analysis focused on the total public expenditure, current expenditure, and capital expenditure to see the variation in spending distribution between capital and operating expenditure. We employed the leptokurtic and kurtosis distributions to determine the abrupt change in the incremental trend of public spending. In several empirical studies, researchers used this method (e.g., Jones et al. 1998; Kovari 2016; Robinson and Caver 2006). In *Punctuated Equilibrium: An Agenda-Based Theory of Budgeting*, Jordan (2002) maintained, "The leptokurtic characteristics of budget is consistent with punctuation equilibrium theory, therefore, further empirical examination of punctuation can't rely on the traditional analysis that assumes normality. . .. extreme or punctuated part of a sample can be great importance" (p. 213).

Throughout this chapter, we sought to answer the following questions: (a) Is it absolute incrementalism or punctuation equilibrium theory that can provide a better understanding of the dynamics of Jordanian public expenditure between 1964 and 2017? (b) Is the current public expenditure in Jordan consistent with punctuation equilibrium theory? (c) Is the capital public expenditure in Jordan prone to punctuation equilibrium theory? To answer these questions, we tested three hypotheses, as follows: first (H1), we hypothesized that Jordanian public spending would show normal distribution of annual change from fiscal year 1964 to fiscal year 2017. As discussed in the "Theoretical Perspectives" section, public spending is innately incremental; however, some events lead to drastic change in incremental trends. This assumption is in line with the work of Brown and Halaby (1984), McDowall and Loftin (1984), and McDonald (1984) because they confirmed that the base year spending is the main influence for the next fiscal year spending, to put it simply. We supposed normal distribution of public spending.

Second (H2), we hypothesized that Jordanian current public expenditure would show leptokurtic distribution of annual change in the period of analysis. Generally speaking, the deviation from incremental trends occurs due to changes in political regimes and parties, as well as public opinion (Baumgartner and Jons 1993). The last hypothesis was built upon the work of Musgrave (1938), whose premise was that the operating expenditure fits into incrementalism rather than capital expenditure. In other words, we hypothesized (H3) that Jordanian capital public expenditure would show leptokurtic distribution of annual change in the period of the analysis. The normality test enabled us to determine the nature of public spending through assessment of distribution of annual changes in national spending in Jordan for 53 years $= \left(\frac{\gamma_t - \gamma_{t-1}}{\gamma_{t-1}}\right) * 100$; the analysis time series began 20 years after Jordan's independence from the British mandate to fiscal year 2017. It is worth mentioning that during this period, several events occurred, such as the Arab-Israeli War in 1967; civil war; succession of three kings; national and global economic crises; changes in prime ministers and governing styles; the influx of Palestinian refugees, Iraqi refugees, and lately Syrian refugees; and the repercussions of the Arab Spring.

## Results

In this chapter, we employed the distribution of annual change in national public expenditure from fiscal year 1964–1965 to fiscal year 2017 in an effort to gain a clear understanding of the theme of dynamics of national spending in Jordan. The descriptive analysis and normality illustrate that the national spending is consistent with the punctuation equilibrium theory. The analysis was based on graphical and statistical analysis, as demonstrated in Tables 1 and 2; the skewness and kurtosis values explain the non-normality distribution of total expenditure, current expenditure, and capital expenditure. The histogram

| | df | P (k-s) | P(S-W) |
|---|---|---|---|
| Total expenditure | 53 | 0.006 | 0.000 |
| Current expenditure | 53 | 0.000 | 0.000 |
| Capital expenditure | 53 | 0.002 | 0.000 |

graphs present the non-normality distribution of these spending categories.

In terms of testing the hypotheses, the examination of the hypothesis regarding Jordanian total public expenditure showed that total public expenditure showed normal distribution of annual change from fiscal year 1964–1965 to fiscal year 2017. The statistical analysis led to rejecting the hypothesis; for example, the skewness value of 1.574 and kurtosis value of 4.964 are greater than 1, and the Kolmogorov-Smirnov test for the skewed data suggested strong evidence of non-normality. For approximately normally distributed data, the null hypothesis reached the level of significance. This was opposite to our expectation that public expenditure would be incremental in nature. The second hypothesis that Jordanian current public expenditure would show leptokurtic distribution of annual change in the period of the analysis was rejected. According to the analysis, the skewness value of 1.451 and kurtosis value of 3.998 are greater than 1, and the Kolmogorov-Smirnov test for the skewed data suggested evidence of non-normality. Finally, the examination of the null hypothesis that Jordanian capital public expenditure would show leptokurtic distribution of annual change in the period of the analysis demonstrated that the skewness value of 1.225 and kurtosis value of 1.901 are greater than 1, and the Kolmogorov-Smirnov test for the skewed data suggested strong evidence of non-normality, so the null hypothesis reached the level of significance (Fig. 1).

## Conclusion and Remarks

In this chapter, we addressed the dominant budgeting theory in Jordan as a developing authoritarian and austere state that has experienced different fluctuations in national atmosphere and neighboring countries due to the repercussions of political fragility in the Middle East. We utilized the annual percentage change in national public, current, and capital expenditure from fiscal year 1964–1965 to 2017. The chapter contributes to the existing literature of punctuation equilibrium theory by employing both statistical analysis and graphical methods to discover the spending trends in the period of analysis.

We conclude that the punctuation equilibrium theory provides better understanding of the Jordanian public expenditure dynamics. This was addressed using normality tests and histogram graphs to check normality. In fact, the non-normal distribution demonstrated the abrupt change in the incremental trends of public spending and demonstrated punctuation. In the

**Jordanian Public Expenditures: Dynamics, Incrementalism, and Punctuated Equilibrium, Fig. 1** Distribution of annual changes in Jordan's public expenditure

same vein, the distribution of annual percentage changes of current expenditure and capital expenditure was prone to punctuation equilibrium theory in the period of spending. We supposed that Jordanian spending, in light of limited resources and austerity, would be incremental, as Bozeman and Straussman (1982) argued that in case of economic problems and austerity, governments are inclined toward piecemeal budgeting. However, the results are congruent with existing studies that addressed the punctuated spending in developing countries and authoritarian regimes, such as the study of Guragain and Lim (2018) on Nepalese budgeting and its relationship with political instability and the landmark study of Rey, Epp, and Baumgartner (2015) on the effect of democratic transition on public budgeting. In this analysis and in the case of Jordan, we could not determine the causes of punctuations, but, as discussed above, there are many possibilities. Therefore, this study opens up space for future research to define the main drivers of radical change in public spending in both current and capital expenditure.

[2]Department of History and Political Science, Azusa Pacific University, Azusa, CA, USA

## Synonyms

Biblical principles; Government; Leadership; Management

## Definition

Judeo-Christian leadership is defined as the understanding and use of (a) leadership principles and illustration drawn from biblical scripture, with (b) particular focus upon biblical characters and events that reflect these principles and practices.

## Introduction

What is leadership? Leadership focuses on getting people to accomplish goals and fulfill purposes. Leaders identify vision, establish mission, develop a strategy, locate and process information, and ultimately motivate people to address the problem. Today, public leaders are challenged by events large and small that significantly alter lives. This ranges from the mundane of budget overruns and personnel problems to the major, including terrorist bombings, mass shootings, and natural disasters. Because of perceived indecisiveness or even incompetence on behalf of some public leaders, the public is losing trust in government and its leaders. A recent survey found that 71% of Americans said government leaders are "not at all" or "somewhat" not credible (Harrington 2017). What is happening? Why do Americans have such low levels of confidence and trust in their public leaders?

Some leadership observers, such as Gilbert Fairholm (1997), argue there is a crisis: a crisis of meaning. Crisis of meaning cuts to the core of leadership potential. It robs leaders and organizations of true worth; it cripples them, rendering them anemic and ineffective. Crisis of meaning cuts across the boundaries of administration, business, politics, ministry, education, and other organizations and institutions. Crisis of meaning negatively affects not only organizational performance and outcomes, but neuters the power of vision, purpose, and leadership credibility.

At the heart of crisis of meaning is a lack of attention on the meaning and importance of the human spirit. The human spirit is the animating force at the core of human beings. The human spirit guides and directs individuals' thoughts and actions, whether privately or publicly. The increasing interest in the role of spirituality and religious principles for leadership today (Fry 2003) suggests that a more focused understanding and greater appreciation for the role of the human spirit in public leadership is needed. Being a good public leader requires more than simply balancing the bottom line or meeting metrics for efficiency and effectiveness. It requires adherence to the principles of leadership that are found in the meaning of spiritual faith. This entry chapter will examine the Judeo-Christian faith tradition.

## Definition of Judeo-Christian Leadership

Judeo-Christian is a phrase that refers to the religious tradition centered in the ethical, historical, and religious tenets associated with both the Jewish and Christian faiths. Although other non-Judaic and Christian faiths, such as Islam, have significantly contributed to our understanding of faith and spirituality and specifically applied to leadership, this entry chapter will focus exclusively on the influence of Judeo-Christianity. Certainly, there are major differences between Judaism and Christianity, not the least of which is the Jewish rejection of Jesus Christ as the Messiah. However, there are some theological similarities between Judaism and Christianity, such as the preeminence of Jehovah God, sharing of passages of

sacred text that warrant further attention, especially as they affect leadership and address the crisis of meaning. Despite some challenges of using the phrase from a theological standpoint, it is beneficial when applied to understanding and appreciating aspects of leadership principles.

Judeo-Christian leadership is defined as the understanding and use of (a) leadership principles and illustration drawn from biblical scripture, with (b) particular focus upon biblical characters and events that reflect these principles and practices. The use of leadership principles, biblical characters, and events drawn from Scripture emphasize a range of human virtues and weaknesses. Principles in general are important because they contain fundamental truths or propositions that provide the foundation for human beliefs and behaviors. Scriptural leadership principles, for example, include human character, wisdom, compassion, servanthood, knowledge, and truth-seeking. Judeo-Christian leadership principles are largely understood and applied to religious leaders, specifically those in church and para-church organizations and institutions. An important point of this entry chapter will highlight several key leadership principles and demonstrate their conceptual and practical use for public sector leaders. [A point of clarification is appropriate: not all Judeo-Christian leadership principles have been perfectly practiced throughout history, including the present age. This is because humans, regardless of their religious and spiritual values conception and training, are imperfect. This entry chapter is simply an opportunity to identify, describe, and discuss leadership principles and practices framed within one specific religious and spiritual framework.]

Spiritual leadership is a term that is more popular in secular leadership literature than the term Judeo-Christian leadership. The term's secular organizational and institutional popularity is largely because it is not specifically tied to or equal with specific religious institutions or traditions, such as Judaism, Christianity, or Islam. Spiritual leadership is derived from the concept "spirituality," whose root is "spiritual." Spiritual comes from the Latin word *spiritus*, which means "breath" or "breathing." The Greek word is *pneuma*, which is more introspective, being translated "spirit, mind, soul, and breathing." All four elements are the essence of the human being, of human life.

Scholars of spirituality tend to connect the human life with "a transcendent being" (Fry 2003), emphasizing that the "basic desire" of humankind is "to find ultimate meaning and purpose in one's life. . ." (Mitroff and Denton 1999). Spiritual leadership, then, emphasizes two elements associated with the Judeo-Christian faith tradition: (a) the dynamism of the human spirit and (b) the revelation of a transcendent reality or vision of life, whether from a divine being or the human spirit.

Judeo-Christian and spiritual leadership hold that the core of the human being is the heart or spirit. Fairholm refers to this as the "emanating force." The transcendent reality or vision of life is the reality (Latin for "thing") that individuals and organizations embrace values that provide a vision and hope for the future (Fry and Slocum 2008, 90). As a result, in many instances the terms are used interchangeably, including Christian Bible teachers (Blackaby and Blackaby 2001) and scholars who examine spirituality and ethical leadership in the workplace (King 2006, 2013). For continuity and clarity's sake, the remainder of this entry chapter will use the term Judeo-Christian leadership exclusively.

This entry chapter will identify and discuss six principles of Judeo-Christian leadership. These principles are supported by Scriptures, using examples and illustrations from both biblical text and secular literature. The principles are not inclusive of all public leadership functions and behavior; however, they aid the reader in understanding the spiritual, ethical, and moral role and functions of public leaders. The principles are *character; fidelity of authority; vision, mission, and strategy; wise decisions; servant leadership;* and *mitigating conflict.*

## Judeo-Christian Leadership Principles in the Public Sector

*Character*. According to Greek tradition, character is the imprint of the human spirit. It is the core

of a person. Character establishes a public leader's personal priorities, securing the foundation for integrity, influencing the public leader's vision, goals, work ethic, attitude, and behavior. In the New Testament, the Apostle Paul identified in I Timothy 3:1–13 and Titus 1:5–9 (KJV) several traits of character required for leadership in the first-century church. For example, in the I Timothy 3 (KJV) account, Paul argues that church leaders should display "spiritual maturity" (v. 2), such as perseverance, forgiveness, courage, humility, and vulnerability. Leaders should "moderate personal habits" (v. 3), such as drinking and selfishness. And church leaders are to exhibit character traits that "beyond reproach" (v. 7), desiring to pursue action that is moral and upright, authentic and filled with integrity of purpose and action. These traits are acquired and not innate, and thus they represent the ethical and moral position public leaders should strive toward.

Critics argue that public leaders are not church leaders. This is true: public leaders are not church leaders; however, public leadership, like church leadership, is based on the ethical foundation of character. Ethical public leaders demonstrate respect, serve others, are just and honest, and strive to build community, both within and outside their jurisdictional authorities. They build relationships between themselves and their followers and serve their constituents before themselves. Ethical public leaders exhibit the highest level of character. They not only pursue the right goal or objective, but do so for the right reason.

*Fidelity of authority.* Fidelity is faithfulness or loyalty to a cause greater than the person. It is derived from the French term, *fidelite*, which in turn is derived from the Latin word, *fidelitatem*, meaning "faithfulness or adherence to something greater." According to the Apostle Paul in I Timothy 3, leaders cannot be "self-willed" or "think of themselves first" (v. 8). The self-willed person is not a leader at all, given that by definition he rejects the welfare of others. A self-willed, or arrogant, person pursues a personal agenda, asserting personal bias in decision-making matters.

Likewise, public leaders are not to be self-willed or arrogant. Public leaders should be committed to a cause or purpose greater than themselves: the public good. If public leaders embrace public virtues such as loyalty, trust, and commitment, then they cannot lead from a self-centered position. A public leader's fidelity of authority is grounded in personal and organizational loyalty and faithfulness to a cause or purpose greater than oneself. The US President's responsibility, for example, is to adhere to the precepts of the USA. Constitution. First responders as well are bound to "protect and serve" the citizens in their local jurisdictions, setting aside their personal desires and goals. Disloyalty or faithlessness to these tenets, demonstrates the public leader's lack of commitment and fidelity to the greater public good.

*Vision, mission, and strategy.* The Bible reflects the articulation, clarification, and provision of vision, mission, and strategy. Countless times throughout the Bible, there are examples where individuals, groups, tribes, or nations sought clarity of vision and mission, while establishing a plan or strategy to carry out the mission. In the Old Testament, for example, Nehemiah had a vision to rebuild the wall that surrounded Jerusalem (Chapter 1, KJV). His mission was supported by the financial and political support of King Artaxerxes I of the Achaemenid Persian Empire [Reign 465–424 BC] and the commitment of the people in Jerusalem (Chapter 2, KJV). Nehemiah established a strategic plan to build the wall, enlisting the aid of workers with specialized skills, maintaining an efficient work schedule, overseeing the administrative aspects, and fending off enemies who tried to stop the work (Chapters 3–6, KJV). In the New Testament, Jesus chastises the Pharisees for not understanding the true vision of the Messiah: to address deep-felt spiritual needs. The Pharisees established religious codes, rules, and regulations for maintaining all aspects of people's lives but failed to see the weightier, spiritual matters that demonstrate concern for the human condition (Matthew 23: 16–24, KJV).

Public leaders have the same opportunity: to create a vision that fulfills both the needs of people and the organization. Public leaders develop a mission that envisions leaders and followers working together to create a service that meets the expectation of the public. Public leaders, working in concert with co-workers, clientele,

public at large, and nonprofit and faith-based organizations, devise plans that meets organizational goals and enriches the quality of lives. Public leaders are required to "create vision, develop a mission, and develop strategy" in an organizational culture conducive to developing relationship, community, and trust (Fry and Slocum 2008, 90–91).

*Wise decisions*. Decision-making is an important element of public leadership. Judeo-Christian leadership focuses on various components of making wise decisions, but two are notable: drawing strength from God or the Divine Being (Isaiah 41:10 KJV) and utilizing wise counsel (Proverbs. 1:5, KJV). In Moses' final days, for example, he speaks frankly and openly to Joshua regarding the need to depend upon God for courage and strength: "Be strong and of good courage, do not fear nor be afraid of them (i.e. enemies); for the Lord your God, He is the One who goes with you. . ." (Deuteronomy 31:6, KJV). Likewise, wise leaders invoke the words of counsel for safety and direction (Proverbs 11:14, KJV), while providing inexperienced leaders with relational support mechanism (Proverbs 12:15; James 1:5, KJV).

Making wise decisions for the public sector requires guidance and counsel but information as well. Wise decisions cannot be made without the public leader having sufficient information to draw from. Today, public leaders have ample information at their disposal, primarily information that comes through calculations of data, assembled in computer databases, spreadsheets, and via forms of information technology. It is the not the amount or detail of the information that is important; it is the will or courage of the public leader to decide. Combine sound information, inner strength and reliance, counsel from others, courage, and intuition, and public leaders have the necessary tools to make wise decisions.

*Servant leadership.* Servant leadership is the bulwark of public leadership. In Mark 10:43b-45 (KJV), for example, Jesus says ". . .whoever desires to become great among you will be your servant. And whoever of you desires to be first shall be (servant) to everyone. For even the son of Man did not come to be served, but to serve. . ." The servant leader is humble and willing to sacrifice material gain for eternal rewards (John 15:20; Colossians 1:24, KJV). Servant leaders encourage and foster in-depth personal and work-related relationships, not only because workers who enjoy working with each other perform better but also because relationships form long-lasting bonds (Proverbs 20:18; Luke 6:12–16, KJV).

Servant leadership theory has become increasingly notable in academic (Weinstein 2013) and popular (Greenleaf 2002, 25th anniversary revised edition) circles. Robert Greenleaf's model focuses on building relationships, encouraging individual and organizational trust, and ultimately leading to increased organizational performance and effectiveness. The servant leader bridges the gap between the organization he leads with the community in which he works. Bridge building breaks down barriers that prevent relationships and in turn fosters trust. Public leaders are entrusted by the body politic to care for and oversee public resources and enact policies that meet the needs of the public good. Stewards of public goods must exercise proper judgment concerning a "right or wrong" or "good or bad" decision.

*Mitigating conflict*. Whereas today's public culture is highly divisive and partisan, Judeo-Christian leadership is committed to promoting peace and negating conflict. The world seeks to promote and flaunt authority. Judeo-Christian leadership seeks to better the lives of followers. At the heart of strife and division is sin, or separation from the sovereign God (James 4:1–12, KJV). The role of the public leader is to not cause divisions, but to promote unity between factions so that the greater common good can be reached.

Public arbitration is to focus on the person, but arbitration means not only resolve the issue, but bring people to heartfelt and soul-centered change (Keegan 1987). Justice, equity, and equality are excellent values to pursue, but if the person's heart is not changed, then the negotiations have failed their biblical purpose (Matthew 23; I Corinthians 6, KJV). Peacemaking is achieved through civil communication and truth-telling (Mark 9:33–36, KJV). When conflicts arise between two people, especially Christians, it is the responsibility of the one who is wronged to go directly to the perpetrator of the wrong and confront in an honest and

transparent way. A third party may accompany, but the goal is to talk with each other, reasoning and clarifying the issue, and work toward an amicable agreement or settlement regarding correcting the wrong (Matthew 18:15–17, KJV). Building relationships based on unity of the heart and an attitude of forgiveness is the hammer needed to break the bonds of divisiveness and dislike (I Corinthians 1:10; Romans 12:10; Ephesians 4:2, KJV).

## Conclusion

If Gilbert Fairholm is correct and there is a "crisis of meaning" in leadership today, then one answer is the continuing evolution and application of Judeo-Christian leadership principles in the public sector. Judeo-Christian leadership principles of *character; fidelity of authority; vision, mission, and strategy; wise decisions; servant leadership;* and *mitigating conflict* reflect some of the basic elements of public leadership and can be universally applied.

The practical application of these principles provides an opportunity for public sector leaders to not only address human weaknesses but also to demonstrate human virtue in leading. If public sector leaders seek to lessen this "crisis of meaning," these principles reflect the inherent need for personal ethical and virtuous character, while emphasizing the commitment for increased organizational performance.

# Judicial Oversight of Bureaucracy

Md. Awal Hossain Mollah
Department of Public Administration
University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Judicial activism; Judicial advice; Judicial charge; Judicial guidance; Judicial review; Judicial stewardship; Judicial supervision; Judicial surveillance

## Definition

Judicial oversight refers to the process by which the judiciary examines the legality of any action of a person or authority, public or private, in accordance with the provisions of the Constitution or any law of a country. Thus, judicial oversight of bureaucracy refers to the procedures and mechanisms of the judiciary by which the functions of bureaucracy are scrutinized and tested based on evidence for its validity or legitimacy.

## Introduction

This chapter deals with a vital issue of governance that is judicial oversight of bureaucracy by which individual rights and accountability of bureaucrats are ensured. Judicial oversight has some common types widely and popularly used globally such as judicial review, judicial supervision, judicial activisms, and judicial advice (Mollah 2014). Typically, judicial review is used for judicial oversight of bureaucracy globally. However, judicial activism is used significantly in South Asia including Bangladesh for the last 20 years. Both judicial review and judicial activisms are closely related to the world famous case of **Marbury vs Madison** in 1803 declared by Chief Justice John Marshall of the USA. In this case, C. J. John Marshall explained that the court has the rights to say "what the law is? A law must be consistent with the Constitution. If there is any inconsistency between a law made by the Congress and the Constitution, it is the duty of the court to enforce the Constitution and ignore the law." Thus, he laid down the foundation of two concepts – judicial review and judicial activism (cited in Lal 2004). These two basic forms of judicial oversight are used mainly as judicial oversight of bureaucracy like very effective means for protecting and promoting individual rights through ensuring accountability and transparency of bureaucracy. Judicial oversight is an effective control mechanism of not only the bureaucracy but also the legislature and the judiciary. It also exercises this power for any unlawful/illegal action of any individual or organization (public or private). In this chapter, the main form (judicial review) of judicial oversight of bureaucracy has been analyzed with case references focused on Bangladesh.

## Judicial Oversights of Bureaucracy in Bangladesh

The bureaucracy exercises a huge volume of power to meet the needs and expectations of citizens through administrative and development activities of the government. Today, bureaucracy is not concerned with only pure administrative function but also involved with a large number of quasi-legislative and quasi-judicial functions (Wade 1971). Therefore, they have a number of chances to become arbitrary or master of the citizens. So, it is very necessary to control them. There are three main formal control organs of the government such as executive, legislature, and judiciary. This chapter highlights only judicial oversight over bureaucracy. Judicial oversight of the bureaucracy is primarily linked to the judicial review and judicial activism. Besides, judicial supervision and judicial advice are also used as judicial oversight. In this chapter, only judicial review and judicial activism have been analyzed with suitable case references.

## Judicial Review

Judicial review means the power of the courts to examine the legality of the official act and thereby to safeguard the fundamental and other essential rights of the citizens. The object of judicial review is to ensure that the authority does not abuse its power and the individual receives just and fair treatment (Wilkey 1985). It is the ultimate power of any court to declare unconstitutional and hence unenforceable any law, any official action based on a law, and any other action of a public official that seems to be conflicting with the Constitution (Abraham 1980). Thus, the judiciary is empowered to check a law or an official act of a government employee or agent for constitutionality or for the violation of basic principles of justice. The Supreme Court is also called the absolute

protector of the freedom and liberty, the authoritative interpretation of the will of the citizens, and the ultimate authority to control any exercise of absolute, impulsive, and arbitrary power (Diwan and Diwan 1996).

In the USA, there is in theory almost no limit upon the right of courts to review the decisions of administrative tribunals and agencies. Similarly, Wilkey (1985) mentioned that in the USA, judicial review produces a "summing up" of "all the rules of administrative law, both procedural and substantive, for if an agency violates any of the fundamental rules or due process of law the agency action is sure to be challenged and ultimately nullified by the courts." On the other hand, in the UK, the general theory of judicial control is comparative. It is commonly called the doctrine of ultra vires. The doctrine of ultra vires means beyond the jurisdiction or excess of jurisdiction or lack of jurisdiction. For example, in a leading case of 1948 in the UK, it has been observed that:

An attack was made on conditions attached to a license for Sunday showings at a cinema. The Cinematograph Act 1909 empowered the local council to Sunday opening of cinemas subject to such conditions as the authority think fit to impose. A license was granted subject to the condition that no children under 15 years of age should be admitted, whether accompanied by an adult or not. This total ban on children and indirectly (in effect) on parents was attacked as being unreasonable and therefore ultra vires (Wade 1971).

Bangladesh and other South Asian countries mostly follow this doctrine of ultra vires for judicial review. The power of judicial review in Bangladesh has been established by Articles 7, 26, and 102 (2) of the Constitution of Bangladesh (COB 2011). Articles 2 and 26 of the Constitution enumerate the full judicial power of the Supreme Court to declare a law passed by the legislature inconsistent with the Constitution or fundamental rights' ultra vires (COB 2011). The judicial review of executive and bureaucratic actions has been empowered by Article 102 (2) of the Constitution.

The common grounds of judicial review under the doctrine of ultra vires are abuse of discretion, breach of statutory duty, abuse of power and authority, irrelevant consideration, exceeding jurisdiction, lack of jurisdiction, malice, breach of mandatory condition, ulterior objects and mixed motives, rule against negligence, acting in the wrong manner, and nonobservance of natural justice.

In exercising the power of judicial review, the law court acts on the principles that "the administrative powers can be validly exercised only within their true limits and public officials are not to be allowed to transgress the limits of their authority conferred by the Constitution or statutory laws" (Islam 2003). Moreover, the court exercises the power of judicial review if any administrative or executive decision is mala fide or in violation of the principles of natural justice or due process of law. Some case example of judicial review has been analyzed below.

## Case Analysis

In the case of ***Motiur Rahman* Versus *Bangladesh*** (2005), an important question of law arose as to whether under s 3(2, 3) of Special Power Act 1974 (later used as SPA 1974) a District Magistrate or Additional District Magistrate is empowered to pass an order of detention making the same effect for 30 days from the date of service of the order of detention as was being done since February 17, 1993, following a circular issued by the then Secretary of Ministry of Home Affairs (in this case total no. of writ petitioners were 18 (57 Dhaka Law Report (later used as DLR), 2005, pp. 327–32). In this regard, MA Aziz and Syed Refaat Ahmed, two judges of the High Court Division (later used as HCD), gave a historic verdict by the judgment passed on July 29, 2003. The court held that from a combined reading of s 3(2, 3), as mentioned above, there cannot be any room for doubt or debate that the order of detention made under s 3(2) cannot remain valid after the expiry of 30 days from the date when the order was made.

This was because s 3(3) of Special Power Act, 1974 (later used as SPA 1974) in an unmistakable and unambiguous term stipulated that an order of

detention will operate with effect from the date of making the order and no such order will remain in force for more than 30 days unless in the meantime it has been approved by the government (57 DLR 2005 p. 328). The court added that the District Magistrate or Additional District Magistrate on the basis of an alleged circular dated February 17, 1993, from the Ministry of Home affairs started detaining persons with effect from the date of service of the order on the detenu. A process would normally take a few days, but this processing time started getting added up with the 30 days of the detention order. Then the court observed that the detention of these additional days was left unaccounted for, resulting in keeping the detenu many days more in custody. This was wholly unlawful and unauthorized simply because it keeps a person in custody for a period longer than permitted by law.

A circular does not have any force of law and cannot override an act of parliament, i.e., the SPA 1974 (DLR 2005, p. 330). The court further observed:

We find that the law of preventive detention is being misused and abused by the officers who have the power to detain a person because of lack of knowledge of the law, particularly the law under which they have been empowered to pass an order of detention. On a reference to each and every order of detention, we find that before signing the order the detaining authority i.e., the District Magistrate/Additional District Magistrate, asserts that on being satisfied as to the necessity of detaining a particular detenu the order of detention is passed. We thus feel that the government should take steps to see that these officers are properly trained for a reasonable period so that they may be imparted with the basic and working knowledge of the law. (DLR 2005, p. 332).

This was a historical verdict of the High Court, which was directed to the Registrar to circulate among all the District Magistrates and all District Session Judges of Bangladesh and also directed to send a copy of the verdict to the Secretary of Ministry of Establishment, the Secretary of Ministry of Home Affairs, and the Secretary of Ministry of Law, Justice and Parliamentary Affairs.

In this case, it has been found that the detenu authority misused SPA, which was against personal liberty and a clear violation of human rights. However, the court heroically declared the aforesaid actions of government were illegal and directed the concerned ministries of the government to take necessary steps regarding this. Thus, the judiciary makes the administration accountable and contributes in ensuring human rights and good governance.

Similarly, in the case of **Khorshed Alam vs Secretary of Ministry of Home Affairs** (Writ Petition No. 194 of 2004, 57 DLR, 2005, pp. 32–4), it was found that the extension of detention order was made by the District Magistrate arbitrarily by abusing SPA 1974, which had no legal basis, and the detenu was set free by the fair verdict of the Supreme Court. We also found that colorable exercise or abuse of administrative power is not allowed by the law and the court, and no one is above the law. Thus, the court compelled the lower court, tribunals, and administration to account for the common law of the country through its judicial review and supervision process. At the same time, the court ensured the personal liberty of citizens as well as human rights.

In another case of **Amirul Islam vs Ministry of Home Affairs** (Writ Petition No. 4345 of 2004, 59 DLR, 2007, pp. 258–63), the petitioner joined as a police sergeant at Khulna Metropolitan Police (KMP), Khulna, on March 9, 2000, and after completing 2-year training period in police service was confirmed as a police sergeant in 2002. Suddenly, the petitioner was placed under suspension by the commissioner in charge of KMP vide office Order No. 282(6) RO dated January 18, 2004, on the allegation that he was involved in immoral activity with one Akhi Islam Ruma. In this case, the court found that the charge was not only the violation of the principles (audi alteram partem) of natural justice but also the provisions of special provisions of ordinance were discriminatory and comparatively harsh in nature. In addition, in the absence of guideline as to which case is treated under PRB and which under the ordinance 1976, the authority enjoys arbitrary power in violation of the nondiscriminatory provision of the Constitution.

Therefore, in view of the overall circumstances, the court constrained to hold that in the instant case there was fair scope to give proper relief to the petitioner as he was deprived of cross-examining prosecution witness and was punished and unheard without giving the opportunity of self-defense as such. Thus, the Supreme Court of Bangladesh plays a very crucial role in ensuring legal accountability of public officials and also in ensuring fundamental rights of citizens, rule of law, and constitutional supremacy that ultimately contribute to good governance through its review power.

Some other cases also found that in exercising the power of judicial review, the Supreme Court acts on the law that administrative powers can be genuinely exercised only within their true limits under laws. For instance, in the case of **Shamima Sultana vs Bangladesh (**Writ Petition No. 3304 of 2003, 57 DLR, 2005 pp. 201–24. Shamima Sultana Seema and nine other petitioners were Ward Commissioners (elected by dated 25–03-2002 City Corporation Election) in the seats reserved for female candidates in Khulna City Corporation under provisions of Section 4 of the Khulna City Corporation Ordinance 1984 (the Ordinance, in short)), the court declared that the government cannot do anything out of the ambit of law or ordinance. In this case, the circular dated September 9, 2002, issued under the signature of the Joint Secretary, Ministry of Local Government, Rural Development and Cooperative, and Local Government Division (Poura-1) was declared illegal and without lawful authority. It was further declared that once elected, commissioners, whether in the general seats or in the reserved seats, male or female, are equal in all respects, and they shall be so treated by all concerned. Thus, the judiciary on the one hand ensured administrative accountability and on the other and more importantly ensured rule of law, equal rights, as well as human rights through this judicial review process.

Similarly, public officials are not to be allowed to transgress the limits of their authority conferred by the Constitution or by statutory laws. The courts can exercise the power of judicial review if the decision is mala fide or in violation of the principles of natural justice or an irrelevant consideration or rule against bias. In the case of **Mamunur Rashid vs Bangladesh (**Writ Petition No. 2529 of 2001, 57 DLR, 2005, pp. 100–103**)**, after observing the evidence and hearings of both parties, the court found some serious anomalies in government records and decoded that the impugned compulsory retirement order shomo (Uni-1) Pa/293–274 dated November 6, 2001, had been passed with mala fide intention and hence was without jurisdiction and was of no legal effect.

From the above analysis, it has been found that if any case appears before the court like inconsistent with the Constitution and law, the court can declare that that case happened without lawful authority and is of no illegal effect. The court can also order the concerned authority to take necessary steps regarding this. Therefore, the court can compel the administration to be accountable to the judiciary or legal system of Bangladesh. In this way, the court, on the one hand, ensures the accountability of government officials and, on the other hand, ensures fundamental rights of citizens.

In contrary, it has also been found that implementation of verdict depends on executive and will of government which is a major challenge and impediment of judicial power and independence. It is evident that Masdar Hossain Case was a landmark case in the history of Bangladesh. In this case, it has been found that Masdar Hossain along with 441 judicial officers (judges) filed a writ petition (No. 2424 of 1995) for separation of the judiciary from the executive in Bangladesh. The High Court delivered its historic judgment on May 7, 1997, in favor of the separation of the judiciary from the executive. However, the government took a stance against this verdict and favored an appeal to the Appellate Division. The Appellate Division also gave its landmark decision in favor of the separation of the judiciary from the executive with 12-point directives on December 2, 1999 (Mollah 2012). Successive governments took 23 adjournments up to 2006, but the verdict remained unimplemented, and it

was finally implemented by an interim caretaker government (2006–2008) in 2007. Perhaps, it remained pending if the then interim government did not implement it. Similarly, a lot of verdicts have been delivered against arbitrary arrest, detention and torture in prison cell, under trial prisons, extrajudicial disappearance and killing, environmental protection, violence against women and children, and violence against minorities and backward groups, but the execution or implementation of these verdicts is either very slow or still remains pending. As a result, violation of human rights, misuse of power, deterioration of law and order, and attack and abduction by militant groups are increasing.

## Is the Judiciary Independent?

*"The ultimate protection of the individual in a society governed by Rule of Law depends upon the existence of an enlightened, independent and courageous judiciary and upon adequate provision for the speedy and effective administration of justice"* mentioned by International Conference of Jurists, held in Bangkok in 1965.

Independence of judiciary means a fair and neutral judicial system of a country, which can afford to take its decisions without any interference of executive or legislative branch of government including personal freedom of judges from political, superior, or any other forms of internal or external interference. Broadly independence of judiciary depends on two aspects – institutional and individual independence of judges. In theory, the Judiciary of Bangladesh is separated and independent institutionally from 2007. However, in practice both institutionally and individually, it is not independent. Few instances can be mentioned here. Individual independence of judges depends on appointment, tenure, and discipline.

Serious controversy has risen regarding the frequent appointments to the High Court Divisions of the Supreme Court. There are allegations that the appointments are made by political consideration. Bangladesh still does not have a law prescribing detailed "qualifications" for the appointment of judges to the Supreme Court. In Bangladesh three basic principles are followed for appointing judges in Supreme Court and subordinate courts, which include the following: seniority, merit, and quota. Out of three, the most practicing criteria are seniority. However, the principle of seniority is not always strictly followed in appointing judges. For example, in 2004 Justice Syed J.R. Mudassir Husain of the Appellate Division of the Supreme Court was appointed the 14th Chief Justice of Bangladesh bypassing Justices M. Ruhul Amin and Mohammad Fazlul Karim, two senior judges of the Appellate Division. Similarly, in 2008 President Prof. Iajuddin Ahmed appointed Justice Mr. M.M. Ruhul Amin as the 16th Chief Justice of the Supreme Court of Bangladesh by superseding Justice Mohammad Fazlul Karim, who was then the senior most among the Appellate Division judges. This practice is still continuing. The present (22nd) Chief Justice Syed Mahmud Hossain has been appointed superseded by Justice Wahhab Miah who was the senior most and acting CJ after the resignation of CJ Surendra Kumar Sinha.

In addition, generally the most senior judges of the High Court Division are appointed to the Appellate Division, but these principles also violated frequently in Bangladesh. From December 1985 to November 2000, this occurred 19 times in Bangladesh (Akkas 2004, p. 140). Similarly, the appointment of Chief Justice A.B..M. Khairul Haque by the President in September 2010 was alleged to have involved the supersession of two more senior judges of the Appellate Division. Similar controversies arose in the appointment of the present Chief Justice of Bangladesh, Justice Muzammel Hossain on 18 May, 2011. In this appointment, Justice Shah Abu Nayeem Mominur Rahman was superseded (and then he resigned).

In the case of High Court Division, seniority principles were violated on February 20, 2001, for instance, three judges were appointed to the High Court Division by superseding senior district judges. In order of seniority the first four judicial officers in the rank of district judges were as follows: Mr. M. Abdul Hye, Mr. Afzal Hossain Ahmed, Mr. M. Abdur Razzak, and Mr. M. Marzi-Ul-Haque.

As an institute the judiciary is still not independent too. For instance, the **cancellation of the 16th amendment of Bangladesh Constitution** is worth mentioning here. Advocate Manzill Murshid with eight other Supreme Court lawyers filed a writ petition to the High Court Division (HCD) on November 5, 2014, questioning the legality of the 16th amendment of the Constitution. The 16th amendment of the Constitution was passed by the parliament on September 17, 2014, without any opposition which repealed the provision of the Supreme Judicial Council (SJC), which was the constitutionally empowered body for probing allegations against judges of the Supreme Court and recommending removal. Through this amendment, the parliament was empowered to remove (impeach) judges for incapacity of misbehavior. In this case, based on the arguments of 12 amicus curiae, on June 1, 2017, the Appellate Division of the Supreme Court chaired by the Chief Justice (Surendra Kumar Sinha) of Bangladesh upheld the High Court verdict (delivered on May 5, 2016) that declared the 16th amendment of the Constitution illegal, unconstitutional, and against the principles of the separation of state powers and the independence of the judiciary (*The Daily Sun*, July 3, *2017*; *The Daily Star*, May 6, *2016*).

However, the verdict has not been implemented as the government did not accept the verdict and challenge for review. In addition, the government compelled 11 "charges" against Chief Justice (CJ) Surendra Kumar Sinha including money laundering and corruption and forced for resign. As a result, he (CJ) has reigned from the post of CJ on October 10, 2017, and went to Australia (The Daily Star, 15 October 2017). Critics raised their voice against this forced resignation of CJ which is a serious threat for judicial independence, which happened for the first time in the history of Bangladesh. Therefore, political and executive interference on judiciary is still continuing though the judiciary has been separated from the executive in 2007. It has also alleged that Surendra Kumar Sinha (CJ) was appointed by the ruling party, by superseding on political consideration.

In case of the lower judiciary, the independence is also a matter of contention. Posting, promotion, and transfer of the judges of subordinate judiciary are still in the hands of the law ministry.

There is criticism also regarding the appointment of public prosecutors, who play a great role in aiding the judiciary to come to a proper decision-making in state-led cases. Bangladesh has a longstanding practice of appointing ruling party-affiliated lawyers as public prosecutors. It is alleged that, following the practices of the past, the current government has replaced the entire group of public prosecutors with members or genuine supporters of the governing party and has also made politically motivated appointments to the Office of the Attorney General. Apart from these, the manner of refusal of bail to political leaders has raised concerns about whether the courts are functioning freely. In addition, presidential pardons in several sensational murder cases to persons affiliated with the ruling party seriously undermined the rule of law.

Therefore, the judiciary is facing political and executive domination and challenges which are the major obstacles of independence of judiciary in Bangladesh. Thus, the real spirit of judicial oversight, rule of law, and good governance is hampering.

## Conclusion

The foregoing discussion and analysis reveal that the role of oversight of the judiciary in protecting the citizen's rights through checking and combating the abuse or misuse of official's power is very effective. However, the courts cannot interfere in the bureaucratic activities of their own accord. They can intervene only when they are invited to do so by any person or organization who feels that his/her rights have been abrogated or are likely to be abrogated as a result of some action of the public officials. Secondly, the courts cannot interfere in each and every administrative act, as too much of judicial action may make the official too much conscious, and very little of it may make them negligent of the rights of

citizens. Though suo moto rule or PIL is effective for rapid action against the arbitrary or abusive exercise of bureaucratic or administrative power, the implementation of the verdicts is dependent on the executive. Besides, the judiciary is not independent enough to take its decision both individually and institutionally. Therefore, strong political will is essential for the execution of the judicial decision. Therefore, both judicial independence and strong political will are a must for effective judicial oversight of bureaucracy in ensuring rule of law and good governance of a country.

## Synonyms

Constitutionalism; Court power

## Introduction

Judicial review refers to the power provided to the judicial branch to formally examine and potentially overturn the work of the legislative or the executive branches of government, generally for nonconformity with the constitution or other higher sources of law. From its roots in the United States, the global spread of judicial review has been nothing short of transformative for modern governance, with courts as much as legislatures or governments now responsible for determining policies within society. Yet, both theoretically and practically, the institution of judicial review brings up difficult issues for modern government, particularly democratic government. Paraphrasing President Lincoln, democratic government can be thought of most directly as "government by the people and for the people." However, through the process of judicial review, judges – unelected actors in nearly all societies – end up holding a veto over the laws created by the people's representatives. For this reason, the eminent jurist Oliver Wendell Holmes Jr. described the exercise of judicial review as the "gravest and most delicate task" that judges are asked to perform. Given the concern that judicial review can be a problematic "counter-majoritarian" force in democratic society, why was the power of judicial review created, and how has it influenced modern governance?

This review describes the principal theories developed by scholars and political thinkers to explain both why the power of judicial review was created and how it may comport with

modern democratic government. The first section provides a brief background and history behind the practice of judicial review. The second section describes major theories of judicial review, while the final section examines broader theories of political conditions under which judicial review is established.

## The Creation of Judicial Review

Given its long and important history in the United States, most Americans assume the power of judicial review is expressly written into the US Constitution. In fact, this power is nowhere stated within the document. Nor is it mentioned in any governing document in England, the source of most US legal tradition. Given this background, where does judicial review come from? It is often said that English Court of Common Pleas Chief Justice Sir Edward Coke provided the first step in *Dr. Bonham's Case* (1610), in which he determined the Royal College of Physicians should not have the ability to imprison doctors, even though the college's enacting law suggested it could. Coke noted that when an Act of Parliament "is against common right and reason," judges following common law principles should set that law aside. However, the expansion of court power suggested in *Bonham's Case* was muted in England after the Glorious Revolution of 1688 solidified the notion of parliamentary supremacy – the idea that parliament is the sole legitimate lawmaking body in the country.

Though muted in England, the American colonists later took up the idea that courts could exercise an independent check on the legislature, particularly after the War of Independence. *Holmes v. Walton* (1780) and *Bayard v. Singleton* (1787) were early examples of state courts ruling state laws unconstitutional. Still, it was not until the US Supreme Court's decision in *Marbury v. Madison* (1803) that the power of judicial review was solidified within American society.

In *Marbury*, the new Supreme Court was faced with a difficult political issue and a separate but related legal issue. The genius of *Marbury* lies in Chief Justice John Marshall's resolution of both problems within a single decision. The political issue resided within William Marbury's legal claim: Marbury argued he was owed a commission to be justice of the peace in Washington, D.C., a commission that was signed by former President John Adams in the final days of his presidency but not delivered to him (in an odd note, John Marshall, serving then as Secretary of State, and Marshall's brother were responsible for delivering the commissions). The new President Thomas Jefferson was adamant he would not allow Marbury his commission, even if the Supreme Court ruled in Marbury's favor. Solving both the political and the legal issue in one fell swoop, Marshall determined that Marbury was owed his commission, but the 1789 Judiciary Act that allowed Marbury to file his claim directly in the Supreme Court contradicted the US Constitution. Given that an Act of Congress violated the Constitution, which principle should stand? To Marshall, the answer was obvious: it must be the Constitution. If the Congress could override the Constitution with simple legislation, then the Constitution is meaningless as a supreme governing document. Yet, a question remained: which actor was responsible for overturning unconstitutional laws? Again, for Marshall, the answer was clear: this power resides with the Supreme Court. To allow the legislature or the executive the ability to determine whether they made a constitutional error would allow those actors to serve as the judges of their own misdeeds. From this case, not from any specific grant of power in the US Constitution, the modern concept of judicial review was born.

Despite the global growth of judicial power today, most societies – democratic or undemocratic – did not wrestle with the complicated issues of judicial review until the latter half of the twentieth century. In fact, after its establishment in *Marbury v. Madison* (1803), very few countries adopted this doctrine within their own governments or allowed their own courts to assume this power. Those few countries that did sanction judicial review of legislation, such as Norway in the mid-1800s, saw their judiciaries extremely hesitant to use such powers. For example, after claiming for itself the hypothetical

power to overturn Acts of Parliament in 1921, the Danish Supreme Court did not actually overturn an Act of Parliament until 1999 (Rytter and Wind 2011). In the Netherlands, the Dutch briefly pursued something like centralized judicial review between 1802 and 1805, though it quickly was replaced. Even in the United States, the Supreme Court did not strike down another federal law after *Marbury* until the infamous case of *Dred Scott v. Sandford* (1857), which ruled unconstitutional the Missouri Compromise of 1820 and removed old barriers limiting the introduction of slavery.

The historical absence of judicial review in many parts of the world can partly be explained by the adoption of the civil law in most countries in Europe and Latin America and many countries in Africa and Asia. In opposition to the prominent role of judge-made law in the common law tradition, the civil law tradition focuses on the predominant role of the legislature in making laws, with a necessarily more circumscribed role for judges. European courts for nearly all of the eighteenth and nineteenth centuries followed this constrained model of adjudication, in which judges were not to interpret the law, but rather apply it to discrete cases using methods of "legal science." In the European separation of powers framework inspired by Montesquieu and Rousseau, lawmaking was the domain of the parliament – which was the repository of "the will of the people." For courts to engage in judicial review would be tantamount to creating, in Edouard Lambert's famous phrase, a "government of judges" unaccountable to the people.

However, the rise of authoritarian governments in much of Europe during the 1920s and 1930s ultimately led to questions regarding the desirability of political processes in which governing parties ruled unchecked by other actors. The end of World War II saw the introduction of new constitutional courts tasked explicitly with the exercise of judicial review in many rebuilding democracies in Western Europe. Southern European countries transitioning from dictatorship to democracy similarly adopted judicial review in the 1970s, as did many Asian countries in the 1980s (Ginsburg 2003). Later, the fall of communist regimes in the late 1980s and early 1990s also led to the formal introduction of constitutional courts in the remainder of Europe and into Central Asia. Nearly all post-Communist countries, including the post-Soviet successor states, explicitly established constitutional courts to review the actions of the elected branches in their own nascent democracies. Similarly, the loss of power by formerly dominant political regimes in South Africa, Israel, and Sweden also led to the establishment of judicial review powers in those countries during the 1970s, 1980s, and 1990s. Currently, nearly 130 countries today have adopted judicial review. And as a result, rights and powers throughout the world are now "judicialized." That is, courts and judges now play a vital role in solving critical social issues and adjudicating the powers of other governmental actors.

## Why Judicial Review?

Given the ability of unelected judges to review and potentially overturn the actions of the democratically accountable legislative and executive branches, scholars, jurists, and political thinkers have long questioned precisely why societies would want the judicial branch to have this "counter-majoritarian" power, particularly in democratic government (Bickel 1962). Thomas Jefferson, for one, believed the executive and legislative branches were just as competent as the Supreme Court to discern what is and is not compatible with the national constitution. Accordingly, Jefferson believed the judiciary – and specifically the Supreme Court – should not hold the final word on constitutional interpretation, but instead should be but one voice among many in the constitutional dialogue.

A practical problem arises from Jefferson's conception of constitutional interpretation. If the branches that make and enforce our laws also serve as equal judges of their own constitutionality, then a separation of powers system of government becomes not so separate. Thus, one commonly cited reason why the judicial branch should hold the power of judicial review is to uphold the separation of powers democratic system and avoid the problem of any one branch

being the judge of its own constitutional powers (Shapiro 1999). Judges, then, serve a valuable role policing the boundaries of constitutional powers, ensuring that any one actor or institution does not breach the constitutional bargain, destroying the Constitution in the process. For example, the Supreme Court's decision in *U.S. v. Nixon* (1974) put to rest the idea that executive privilege allows the President to avoid a valid criminal investigation by courts or prosecutors. Similarly, constitutional courts from Spain to Slovenia regularly adjudicate constitutional disputes between central governments and regional or local governments. In doing so, these courts ensure that regional actors and national actors alike abide by the structure of government and the limitations on their respective powers.

In addition to serving as a neutral adjudicator of constitutional borders, judges exercising judicial review can serve a valuable role as protectors of democratic principles, specifically defending the rule of law and ensuring equal treatment of all actors in society (Guarnieri and Pederzoli 2002). In a democracy, the people's representatives in the legislature and the executive government are given the power to enact legislation and implement laws. Yet nearly all countries today are governed by a constitution – a set of higher laws and principles designed to set the boundaries of legislative and governmental power. Without the power of courts to review and potentially overturn the acts of these other actors, the limits – but also the principles – contained within the constitution can be transgressed without punishment. In fact, the inability of civil law judges in Continental Europe to check abuses of power by elected actors is seen by many as a primary cause of the fall of democracy and the rise of authoritarianism in Germany, Italy, and other European countries in the 1920s and 1930s (Stone Sweet 2000). At the same time, the idea that judges can serve as protectors of traditional democratic principles often is credited as a major reason why these same European countries adopted judicial review through constitutional courts after World War II.

The non-majoritarian, even counter-majoritarian, nature of courts has driven a second broad theory for judicial review powers: that judges should be able to exercise judicial review because they are best placed to protect individual rights within society. Even in democracies, elections to select judges are almost unheard of (though many US states have adopted the practice). Many rights-based scholars argue that with no democratic constituency to answer, the judiciary can act to protect the interests of those who lack political influence in the elected branches of government. Specifically, judges can use the power of judicial review to ensure that minority groups and minority views within society do not suffer from discrimination and that they receive the democratic bargain on the same terms as the majority.

This rights-protecting theory has both activist and more skeptical adherents. The more activist branch views the courts as the best venue to handle matters of individual rights protection, particularly for rights that lack majority support. Justice William Brennan, for example, viewed the US Constitution as the basis for advancing evolving standards of social justice and human dignity in society, with the Supreme Court the protector of those values. In a noted 1985 speech, Brennan used the example of the death penalty to illustrate his views on the role of the courts in the protection of constitutional rights. Despite popular support for capital punishment, Brennan believed that broader constitutional values of justice and human dignity must be protected and advanced for all, even if a majority of American society was unwilling to recognize those values. Similarly, Brennan and others advanced the constitutionality of affirmative action programs as a way to ensure that groups that have faced historic discrimination receive opportunities to advance in society.

Yet, given the inherent counter-majoritarian problems of judicial review, many jurists and legal scholars have advanced a concurrent doctrine of "judicial self-restraint." Beginning with the eminent Harvard Law Professor James Thayer (1893) and continuing through the works of Felix Frankfurter, Alexander Bickel, and others, legal scholars have argued that courts must exercise self-restraint when reviewing the actions of the elected branches of government, providing these democratically accountable actors with sufficient latitude to ensure that the interests of the people

can be expressed in legislative policy. Given the broad and abstract nature of many constitutional provisions, the judiciary should not dissect specific provision of laws, nor should they question too severely the possible motives behind laws. More directly, a judge's self-proclaimed "sense of what is right" should not trump the decisions of the elected legislative majority, and laws should be overturned only when a clear violation of constitutional norms has occurred, lest the judiciary become a super-legislature.

This sense that the power of judicial review must be used with restraint in democratic society has driven a more skeptical "rights-protecting" branch of scholars. This branch is typified by John Hart Ely (1980), who questioned the desirability of unelected judges overturning the will of the people's representatives in the Congress. However, Ely nevertheless believed that judicial review could and should be used in certain circumstances, notably to correct procedural errors in the democratic system and to protect oppressed minority groups within society. The minority protection theory is commonly associated with major US Supreme Court rulings, including *Brown v. Board of Education* (1954), which overturned long-standing segregationist education policies in much of the United States, and *Loving v. Virginia* (1967), which overturned state laws criminalizing marriage between people of different races. It is important to keep in mind that many of these segregationist policies were popular at the time: as many as 80% of Americans at the time approved of the anti-miscegenation laws overturned in *Loving*. Thus, the Court's rulings can be viewed as protecting minority rights, or even unpopular views, in the face of public opposition.

Are such minority rights-protecting efforts successful? Current views are mixed. One popular theory considers the Court's *Brown* decision to be largely a failure, as segregationist educational policies continued for years through "massive resistance" against desegregation in the South. Rosenberg (2008) famously termed the idea that courts can influence social change a "hollow hope," with the Court's desegregation efforts serving as critical evidence in favor of a "constrained" court theory. Yet the Court's decision likely did play a role in changing public perceptions of racial inequality. By offering moral leadership on the issue of racial equality, the Court's decisions contributed first to more limited executive actions, such as President Eisenhower's decision to desegregate the Little Rock schools with the US military, before ultimately helping to guide the passage of the 1964 Civil Rights Act and 1965 Voting Rights Act. Thus, much like Franklin and Kosaki's (1989) "republican schoolmaster" theory, the Court's decisions – while not completely successful on their own – contributed to attitude changes in government and in popular society.

However, others have noted the Supreme Court has not always been a champion of individual rights or minority rights in American society. Far from protecting minorities, until *Brown*, the Supreme Court's 1898 ruling in *Plessy v. Ferguson* legitimized institutional racism in American society, paving the way for further restrictions on the rights of African-Americans and people of color in many parts of the United States. This more critical examination of Supreme Court rulings has led to the development of a third broader theory for the value of judicial review. Unlike previous theories, which explicitly or implicitly assume some amount of counter-majoritarian behavior by courts exercising judicial review, increasing numbers of scholars endorse what can be termed "majoritarian" judicial review.

The late Yale Political Scientist Robert Dahl developed this notion of majoritarian judicial review in the late 1950s after noticing that the Court had rarely used its power to directly challenge the policies of the Congress or the President. Dahl (1957) proposed this lack of confrontation should not be surprising, as Supreme Court justices are nominated and confirmed by the President and Senate, actors who themselves have been elected by popular majorities. Therefore, given the assumption that these political actors will select judges who think like them on legal and policy matters, we should see the Supreme Court not acting as a brake on public policy, but rather playing an important *legitimizing* role within society for the policies adopted by current elected majorities.

To greater and lesser degrees, other prominent theories justifying judicial review focus on the value judicial review has to democratic majorities. Mark Graber (1993) describes how political leaders have, at certain moments in history, welcomed the courts to enter the "political thicket" and help provide solutions to difficult political issues. Courts can act in a more directly majoritarian manner when they take on entrenched special interests that have prevented the majoritarian process from functioning in its intended manner (Klarman 1997). The example of legislative redistricting provides an illustration. By the 1950s, many states had failed to properly redistrict their local legislative districts, with the result being vastly underrepresented urban areas and overrepresented rural areas. In a series of cases, the Supreme Court took on these entrenched interests in state politics, in the process ensuring an equal voice in politics for growing urban population centers.

Alternatively, judicial review can be used to help elected actors resolve legislative problems (Rogers 2001). Legislators are charged with creating laws, yet they also work with what economists would call "imperfect information." That is, they cannot see into the future and know with certainty how the laws they enact will work out among the public. However, judges do have the benefit of seeing how the laws they are asked to review have worked within society, and so can offer a valuable benefit to elected actors, striking down those parts of laws that have not worked well and keeping those that have.

Even if judges do act in this majority-enhancing fashion, normative problems arise when viewing judges as majoritarian or majority-enhancing actors. If judges exercising judicial review are expected to check the impulses of the elected branches, and are given independence protections like life tenure and salary guarantees to ensure they can act as guardians of the constitution, then who "guards the guardians"? That is, how can we ensure that judges, the most democratically unaccountable actors in government, stick to the democratic bargain and ensure they do not use the power of judicial review to overturn democratic principles? Examples abound of unelected and unaccountable judiciaries ratifying policies that harm the interests of liberal democracy. Lisa Hilbink (2008) explains that the Chilean Supreme Court, dominated by traditional conservatives, largely endorsed the Pinochet regime's violent suppressive crackdown on civil society and socialist party supporters. Similarly, the *Lochner* era Supreme Court, which struck down major state and federal laws to regulate hours and working conditions in American society, is often criticized for ignoring the needs of the expanding industrial working class in favor of wealthier business owners.

One answer comes from the burgeoning study of judicial legitimacy. Basic legitimacy theory holds that the power courts receive from society is based on the respect the public grants to judicial outcomes. Specifically, legitimacy is seen in the willingness of individuals to obey decisions even if they disagree with those outcomes personally (Gibson and Caldeira 2009). As Hamilton noted in *The Federalist Papers*, the judicial branch lacks control of the purse and the sword – key items in government, democratic or otherwise. Instead of force or will, the power of the courts comes from their exercise of *judgment* in resolving cases. For legitimacy theorists, the reason why we respect the judgments of the Court is because they are viewed as principled outcomes, not the product of politics. Yet, with their source of power arising from public support, judges have a critical incentive to avoid adopting outcomes that stray too far from what is publicly desirable, as such outcomes would ultimately lead to the loss of public trust and support for the judiciary. And without public support, the courts have no effective way of ensuring that the other branches of government respect their outcomes. Thus, judicial outcomes ultimately are limited by the need to gain or maintain legitimacy for their outcomes, which means adhering to principled outcomes without overt partisan bent.

With the emphasis on judicial legitimacy, a growing area of research has focused on the middle ground between activism and democratic accountability. Specifically, recent work has sought to examine whether courts also follow the mood of the public when making decisions, much like national elected leaders. Tom Clark (2011)

examines how the Supreme Court has responded to public opinion and public pressures over time. Looking at the number of laws overturned in a given year, there is evidence that the Supreme Court has been more reticent to strike down laws when public opinion of the Court is low and more activist when public opinion of the Court is high.

## The Political Logic of Judicial Review Powers

Finally, given the theoretical need to establish judicial review, why would political actors ever choose to establish an institution that effectively limits their own powers? This question is much more than academic: both the United Kingdom and the Netherlands represent two examples of well-functioning liberal democracies in which judges cannot overturn the laws enacted by the parliament. At the same time, several communist regimes – including Poland and Yugoslavia – adopted courts with limited judicial review powers despite the absence of democratic norms. Thus, the reasons must go beyond a simple narrative in which well-performing countries adopt judicial review and despotic or autocratic regimes do not.

Scholars adopting the "insurance theory" of judicial power have argued that politicians have incentives to provide courts with strong review powers, but only in some circumstances. In competitive political environments, where several parties believe and are perceived to be able to win elections and be competitive in the future, all of the major parties have incentives to provide for strong court powers. The logic centers on the need to "insure" against future losses in the electoral arena. Even if party A believes it can win the current election, its leaders also know that parties B or C may win the next election. And even though parties A, B, and C may not want to subject their own policies to judicial review, they all will allow judicial review powers as a way to provide insurance against overreach by other parties when those parties are in power (Ginsburg 2003). Conversely, when a single party recognizes it should dominate electoral politics, it should be less likely to adopt or concede to the strong judicial powers that can limit government policies. The insurance model does have explanatory power: evidence suggests varying levels of judicial empowerment in Mexico, Italy, Japan, and Taiwan can be explained through the idea of judicial review as political insurance.

Finally, as judicial review has spread during the last century, new insights into the practice of judicial review have come from qualitative and quantitative studies of high courts around the world. Many of the most important insights have clarified existing work developed in the United States. Confirming Dahl's basic theory of policy-motivated judicial review, judges in France, Germany, Spain, and elsewhere roughly follow the views of their appointing parties (Hönnige 2009). However, there clearly is more to high court judging than simple politics. Studies of the German Constitutional Court have brought greater depth to understanding how courts interact with parliaments in a separation of powers model of democratic government (Vanberg 2005). Specifically, it appears courts overturn legislation at higher rates in several key instances: first, when they are given a prominent public issue and, second, when interest groups or prominent political actors also support overturning legislation. However, the Constitutional Court also listens to the briefs produced by the parliament: when parliament weighs in on a court case, the German judges generally rule in parliament's favor. Similarly, the European Court of Justice carefully considers member state support for keeping or discarding legislation in its own exercise of judicial review within the European Union (Carrubba et al. 2008).

## Conclusion

From modest origins rooted in a lack of court power, the institution of judicial review has become a dominant force in national politics throughout the world. As more citizens awake to the possibilities of rights protection and the advancement of policies through legal mobilization, there has been greater "judicialization" of rights and of law and policy. No longer do citizens in France, Germany, or Poland have to go to their

local member of parliament or the town council to obtain justice or change the laws. They now can go to court to obtain the rights that formerly were determined by elected leaders. Yet, this power of judicial review contains difficult problems for democratic societies built on the "will of the people." Specifically, there arises the counter-majoritarian concern that unelected judges will overturn the people's preferred outcomes. Solutions to this counter-majoritarian problem have come in several forms. One traditional view justifies judicial review as necessary to uphold the constitutional structure of government, to police the borders between national actors and between federal and local authority. Another justification for judicial review, potentially more expansive for judicial power, portrays courts as the best venue for determining rights in society, particularly minority rights.

If judges have control over rights protection and rights enforcement, then how can society ensure that judges don't then run riot, fashioning new rights for society as they (and only they) see fit? An answer to this conundrum is found in the third major rationale for judicial review: that judges often do not run riot, but instead seek to fashion solutions that are in line with majority sentiment. We really have nothing to fear, according to this view, as judicial review generally is used to either legitimate political power or else remove obstructions preventing majority-promoted outcomes. Thus, judicial review allows for protection of constitutional norms and values while allowing society to change the interpretation of those constitutional values over time, turning more progressive or more conservative with changing times. Viewed in isolation, any of these three theories may not capture the nuances of judicial decision-making. However, when combined, they do offer a fairly complete sense of the motivations for judicial review and the benefits judicial review provides.

## Judicial Review of Significant Agency Programs

Patricia Ross McCubbin and Steven Rodgers
Southern Illinois University School of Law, Carbondale, IL, USA

### Synonyms

"ObamaCare" is an informal label for the Patient Protection and Affordable Care Act.

### Definition

"Judicial review" refers to the process by which judges determine whether an agency action should be allowed to proceed.

"Uphold" means "approve" or "allow," so when a judge upholds an agency action, the judge allows the action to proceed.

"Reverse" means "disapprove" or "disallow," so when a judge reverses an agency action, the judge does not allow the action to proceed.

"Standards of review" are the legal tests judges use to determine whether to uphold or reverse agency action.

### Introduction

The US Congress often delegates authority to federal agencies to implement programs that are only loosely described by Congress in the agencies' governing statutes. Sometimes Congress merely leaves technical details to the agency and rightly so, because the agency has more expertise on technical matters than Congress does. Sometimes, however, Congress leaves ambiguities on more central elements of a statutory program, and an agency has to make policy choices to flesh out the contours of the program (or at least has the opportunity to do so).

Those agency choices can be quite controversial, and often an objecting party (or many parties) will bring a lawsuit asking a court to review and block the agency's action. Lawsuits challenging agency actions raise a fundamental question: How aggressive should the court be in its review? To answer that question, federal administrative law has developed certain doctrines, referred to as "standards for judicial review," that establish the level of "deference" a court should give to the agency. By "deference," we mean the extent to which a court should accept an agency's action, and some standards of review are more deferential (or more accepting) than others. Using a deferential standard of review, a judge will be more inclined to accept an agency's view, but if a court uses a less deferential standard of review, the judge will be more skeptical of the agency and will be more inclined to reject the agency's action.

One of the more common standards of judicial review, known as the *Chevron* standard, is fairly deferential, directing a court to accept an agency's reasonable interpretation of a statute if Congress did not speak directly to the issue at hand (Chevron 1984). (All standards of judicial review take their name from the legal case announcing the standard, with the name written in italics when it is discussed in the text.) More recently, however, courts have questioned whether the *Chevron* standard is appropriate when an agency's program affects huge portions of the American economy and millions of citizens. The courts have grown increasingly skeptical of agencies imposing enormous consequences on American society under the guise of merely "interpreting" an ambiguous provision in a statute. US Supreme Court Justice Antonin Scalia expressed this skepticism most succinctly when he wrote that Congress does not "hide elephants in mouseholes" (American Trucking 2001, p. 7).

Consistent with Justice Scalia's skepticism, the Supreme Court has applied a less deferential standard of review to agency decisions of "vast economic and political significance," demanding that Congress clearly indicate its intent to allow an agency to wield "enormous and transformative" powers (Utility Air Regulatory Group 2014).

Vague or ancillary terms in a statute (the "mousehole") are not enough to give an agency authority to implement significant programs (the "elephant"); there must be a clear statement from Congress of the agency's power to do so.

This more aggressive judicial review particularly came to light in the challenge to the federally created healthcare exchanges under the Patient Protection and Affordable Care Act (often called "ObamaCare"), which would have affected a vast majority of the American citizenry and billions of dollars in economic activity. In a 2015 decision about those healthcare exchanges called *King*, the Supreme Court refused to apply the typical *Chevron* analysis because of the enormous significance of the issue (King 2015).

This article will first provide a brief summary of the *Chevron* deferential standard and then move chronologically through a series of cases that each added to the growing skepticism about using *Chevron* when agencies introduce major programmatic changes based on vague or narrow terms in a statute. Included in the discussion will be two important predecessors to *King* – the *Brown & Williamson* case and the *Utility Air Regulatory Group* case – and then *King* itself.

This article will also highlight important questions raised by *King* and its progeny. If some agency programs have such "vast economic and political significance" that they cannot be left to an agency's discretion when implementing an ambiguous statute, how do we determine what counts as a "significant" agency program and what does not? As we will see at the end of this article, only 1 week after the *King* decision, the Supreme Court reviewed an agency action that might have had economic effects of $9 billion, and yet the Supreme Court applied a traditional *Chevron* analysis. Where, then, is the line between "significant" programs deserving less deference and other programs deserving *Chevron* deference?

## The *Chevron* Deferential Standard of Review

The *Chevron* deferential standard of judicial review requires a court to conduct a two-part analysis when determining whether to reverse or uphold an agency's interpretation of the governing statute. At the first step, a court must ask whether Congress has directly spoken to the question addressed in the agency interpretation. If so, the court and the agency must give effect to Congress's unambiguous intent. However, at the second step, if Congress has not clearly spoken to the question at hand, the court should uphold the agency's construction of the statute if it is permissible. Ultimately, a court should not replace its judgment for that of the agency as long as the agency's interpretation of the statute is reasonable (Chevron 1984). *Chevron* review is most appropriate when an agency has announced its interpretation of the statute in a formal manner, such as in a notice and comment rulemaking, rather than in something less formal, such as letters from low-level agency personnel.

The *Chevron* standard arises from the theory that policy decisions should be made by politically accountable actors. If Congress, the most politically accountable branch, has not directly addressed an issue, then it is more appropriate for the policymakers at the agency level, rather than the court, to give meaning to the ambiguous congressionally drawn statute (Smiley 1996). Even though the agency personnel are not *directly* accountable to the citizenry, they are *more* politically accountable, through the oversight of the president, than the unelected judges, and therefore, their reasonable interpretations should trump the courts' interpretations of Congress' ambiguous words.

## Early Examples of More Skeptical Judicial Review

In 1980, only a few years before *Chevron*, the Supreme Court refused to allow an agency to greatly expand its regulatory program based on ambiguous terms in the governing statute. In a case called *Industrial Union*, a plurality of the Justices concluded that the Occupational Safety and Health Administration ("OSHA") was *not* allowed to regulate *all* risks, as the OSHA claimed, but only the most important risks. In

rejecting the OSHA's interpretation, the Supreme Court wrote: "*In the absence of a clear mandate in the Act*, it is unreasonable to assume that Congress intended to give the Secretary the *unprecedented power over American industry* that would result from the Government's view" (Industrial Union 1980, p. 645, emphasis added).

Then, in the *MCI Telecommunications* case from 1994, the Supreme Court dealt with a provision of the Communications Act that allowed the Federal Communications Commission ("FCC") to "modify" any requirement found within the statutory section. Within the section was a requirement that "common carriers" (businesses involved in the transmission of communications) file tariffs with the FCC. The agency sought to "modify" the tariff-filing requirement by making the decision to file optional for all nondominant long-distance carriers. The Court noted that the rate-filing requirements were an essential characteristic of the industry, at one point comparing the requirements to the heart of the human body. Thus, the Supreme Court found it very unlikely that Congress left the decision of whether the industry would be rate regulated entirely to agency discretion. Additionally, even if Congress did intend to give the FCC such great power, it would not have done so by using "such a subtle device as permission to 'modify.'" To use the "elephants in mouseholes" analogy, Congress would not hide the elephant (the ability to fundamentally alter the rate-filing requirement) in a mousehole (the word "modify"). Instead, by granting authority to "modify" requirements within the statute, Congress only permitted the agency to make "a less than radical or fundamental change" (MCI Telecommunications 1994).

## *Brown & Williamson*: A Key Predecessor to *King*

One of the most prominent examples of greater judicial skepticism came in 2000 in *Brown & Williamson*, a key predecessor to the *King* decision. There, the Supreme Court analyzed a statute that granted the Food and Drug Administration ("FDA") the authority to regulate drugs and devices. Drugs were defined as articles "intended to affect the structure or any function of the body" (Brown & Williamson 2000, p. 2). Device was defined as an "instrument, apparatus, implement, machine, contrivance,. . .or other similar or related article" (Brown & Williamson 2000, p. 2). In a highly controversial decision, the FDA concluded that tobacco products fell within these statutory definitions, and the FDA planned to ban tobacco products altogether because they could not be deemed "safe" as required by the statute. This decision would have substantial economic ramifications for the tobacco industry, which the Supreme Court described as "a significant portion of the American economy" (Brown & Williamson 2000, p. 37).

The Court declined to give the FDA the usual *Chevron* deference, stating that "Congress could not have intended to delegate *a decision of such economic and political significance* to an agency *in so cryptic a fashion*" (Brown & Williamson 2000, p. 38, emphasis added). The Court reasoned that in extraordinary cases there is reason to hesitate before concluding that Congress intended the implicit delegation. Looking at the statute as a whole, the Supreme Court concluded it was clear that Congress intended to exclude tobacco products from the FDA's authority. Thus, the FDA's interpretation was impermissible under *Chevron* Step 1 (Brown & Williamson 2000).

## *American Trucking*: Origin of the "Elephants in Mouseholes" Phrase

In the 2001 Supreme Court decision in *American Trucking*, Justice Antonin Scalia coined the "elephants in mouseholes" phrase. In doing so, he built on the concepts of both *MCI Telecommunications* and *Brown & Williamson*, writing that Congress "does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions" (American Trucking 2001, p. 7). The fundamental detail in *American Trucking* was whether the US Environmental Protection Agency ("EPA") was allowed to consider implementation costs when it set the National Ambient Air Quality Standards ("NAAQS"). The Clean

Air Act directed the EPA to set air quality standards at a level "requisite to protect the public health" with "an adequate margin of safety." The EPA refused to read that focus on public health as allowing it to consider implementation costs, which would only weaken any public health standards, but the industry opponents argued that cost considerations were entirely appropriate. Because the NAAQS were the key part of Title I of the Clean Air Act, the Supreme Court demanded a clear textual commitment that costs were to be considered in their implementation. Industry members argued that the terms "adequate margin" and "requisite" left room for the EPA to consider costs. These phrases, the Supreme Court concluded, were "vague terms" that were not sufficient to alter a fundamental detail of the statutory scheme (American Trucking 2001).

Interestingly, this case is an outlier in the sense that unlike *Brown & Williamson* and *MCI Telecommunications*, the agency was not seeking to expand its power or stretch its jurisdiction; only its industry opponents were seeking to do so. Thus, *Chevron* was never expressly invoked in this part of the Supreme Court's analysis. The case is helpful, however, because it strengthens the doctrine that if a party seeks to read a statutory provision in a way that would fundamentally alter the overall statutory scheme, the party must present a clear textual commitment in support of its position.

## *Utility Air Regulatory Group*: Another Key Predecessor to *King*

In the 2014 decision in *Utility Air Regulatory Group*, the Supreme Court rejected an EPA interpretation of the Clean Air Act as unreasonable because it would have brought "an enormous and transformative expansion in the EPA's regulatory authority without clear congressional authorization" (Utility Air Regulatory Group 2014, p. 19). That exact language first appeared in this case, but the concept was implicit in *Brown & Williamson*. At issue in *Utility Air Regulatory Group* was whether the EPA reasonably interpreted the Clean Air Act to say that tens of thousands of small facilities would now have to get permits for their greenhouse gas emissions under certain permitting programs for air pollution sources. The EPA acknowledged that this interpretation would lead to a huge expansion of its regulatory regime. The programs at issue were Title I and Title V of the Clean Air Act, which required construction or operational permits for major air pollution facilities. For Title I purposes, a major emitting facility was defined as any stationary source that could emit 250 tons per year of "any air pollutant," and for greenhouse gases, 250 tons per year was a relatively low number, so that threshold would sweep thousands of small sources into the programs that previously had not been regulated. The EPA believed it had to read the statute in this manner, because an earlier Supreme Court decision (Massachusetts 2007) held that the Act-wide definition of air pollutant included greenhouse gases (Utility Air Regulatory Group 2014).

The Court rejected the EPA's interpretation as impermissible under Titles I and V, finding that the *Massachusetts* case dealt with a different part of the Clean Air Act (Title II, on vehicles) and thus was distinguishable based in part on the text of the statute but primarily on the context. For example, if Title I of the Clean Air Act encompassed greenhouse gases, then the annual permit applications would increase from 800 to nearly 82,000. Also, annual administrative costs would increase from $12 million to $1.5 billion. The EPA admitted that this growth in regulatory authority would be "unrecognizable to the Congress that designed" the Clean Air Act. In light of the extraordinary scope of the Title I program, the Supreme Court reiterated its less deferential scrutiny from *Brown & Williamson* and found that the EPA's interpretation was unreasonable "because *it would bring about an enormous and transformative expansion in EPA's regulatory authority without clear congressional authorization*" (Utility Air Regulatory Group 2014, p. 19, emphasis added). Applying that principle led, in essence, to a drastic rewriting of the usual *Chevron* analysis. The Court stated that because the statute did not compel the EPA's interpretation, it was "patently unreasonable" for the agency to attempt to read the statute in a way that would grant it such expansive power, thus

merging *Chevron* Steps 1 and 2 (Utility Air Regulatory Group 2014).

Thus, in future cases, the *Chevron* Step 2 determination of reasonableness may become a determination made at *Chevron* Step 1. If the agency proffers an interpretation that would create an "enormous and transformative expansion" of agency authority, involves a decision of "vast economic and political significance," or fundamentally alters a statutory scheme, then Congress must have expressed clear authorization to grant the agency the authority. In other words, ambiguity at *Chevron* Step 1 actually leads to the conclusion that Congress clearly did not intend to delegate the agency the expansive authority.

## The *King* Decision: ObamaCare as an "Extraordinary" Case

In its 2015 decision in *King*, the Supreme Court took another step by completely bypassing *Chevron* analysis because it was dealing with an "extraordinary" case. The statute at issue was the Patient Protection and Affordable Care Act ("ObamaCare"), which regulates health insurance affecting millions of people and billions of dollars annually. The Court declined to defer to the agency's interpretation of the healthcare law for two reasons. First, invoking *Utility Air Regulatory Group* and *Brown & Williamson*, the Supreme Court determined that it was dealing with a question of "deep 'economic and political significance'" and if "Congress wished to assign that question to an agency, it surely would have done so expressly" (King 2015, p. 8). Second, the agency whose interpretation was under review was the Internal Revenue Service ("IRS"), an agency that did not specialize in health insurance policy. With no deferential review, it was up to the Supreme Court to determine the meaning of the statute.

The particular question at issue in *King* was whether tax credits were available on so-called Federal Exchanges – healthcare markets established by the federal government, rather than the states. The statute provided for tax credits for certain individuals enrolled in health plans through "an Exchange established by the State." The Court conceded that the most natural reading would lead to no qualified individuals on Federal Exchanges. However, the Supreme Court determined that when read in its place in the overall statutory scheme and not as an isolated provision, the meaning of "Exchange established by the State" was not so clear. This context-specific interpretation was reminiscent of the Supreme Court's decision in *Brown & Williamson*, where tobacco products clearly fell within the literal meaning of drugs and devices (King 2015).

Upon concluding "Exchange established by the State" was ambiguous in isolation, the Supreme Court had to look to the Act's broader structure to give the phrase meaning. That structure, the Court concluded, required the Justices to read the language as applying equally to State and Federal Exchanges. Otherwise, the individual insurance market would destabilize and result in "death spirals" the Act was enacted to avoid. This result would occur because one of the three key reforms, the tax credits, would be ineffective in states where there was a Federal Exchange. Research indicated that 87% of individuals who bought insurance on a Federal Exchange did so with tax credits. Without the tax credits, nearly all of those individuals would be exempt from another essential reform, the coverage requirement. The coverage requirement is in place to maximize the number of individuals who are covered by health insurance. Basically, as long as health insurance would not exceed eight percent of an individual's income, that person must either buy health insurance or make a payment to the IRS (King 2015).

Thus, there would have been a domino effect without tax credits on Federal Exchanges. The Court cited two studies that concluded health insurance premiums would increase by 35–47% and enrollment would decrease by 69–70%. Based on these severe repercussions, the Supreme Court stated it was "implausible" that Congress intended the Act to operate in such a fashion. Congress, in enacting the Affordable Care Act, attempted to support the healthcare markets, not destroy them. Finally, the Supreme Court invoked *American Trucking* for the proposition that Congress does not alter the fundamental details of a

statute in vague terms or ancillary provisions, rejecting the notion that the viability of the Affordable Care Act turned on the "ultimate ancillary provision": a "sub-sub-sub section of the Tax Code" (King 2015).

## Questions Raised by the Less Deferential *King* Standard of Review

The notion from *King* and the earlier cases that Congress must speak clearly if it intends to delegate authority to agencies over programs of vast economic and political significance raises two key questions. First, how is a court to determine when an agency program rises to the level of such significance? The challengers will, of course, try to provide data about the grand scope of an agency's program. The Court in *King* relied on the parties' projections of premium costs rising and coverage declining. Similarly, the Supreme Court in *Utility Air Regulatory Group* took projections into account for the number of new permits and costs to regulate. This focus provides an incentive for challengers to overstate the effect of upholding a controversial agency action.

The line between programs of "vast economic and political significance" and lesser programs seems unclear. Indeed, just 1 week after the *King* decision, the Supreme Court decided another important challenge to an agency action, yet it did so under traditional *Chevron* analysis despite potentially major economic ramifications. The case involved a controversial rulemaking by the EPA to regulate mercury and toxic emissions from power plants, with the estimated compliance costs as high as $9 billion (Michigan 2015). The contrast between that case and the *King* case means that, in most future litigation about agency programs, the litigants will constantly battle about whether the enhanced scrutiny of *King* is or is not applicable. Indeed, that question is implicated in the ongoing challenges to two signature programs of the Obama Administration: (1) the Clean Power Plan (known as the "CPP," regulating greenhouse gases from existing power plants) and (2) the Deferred Action for Parents of Americans and Lawful Permanent Residents program (known as the "DAPA," announcing plans not to remove aliens under US immigration laws under certain circumstances). As those cases play out in the lower courts and then at the Supreme Court, the standard of review will be critical to the success or defeat of the programs.

The second key question is this: How is the more demanding standard of judicial review from *King* and its predecessor cases consistent with recognizing that Congress often delegates in broad terms so that agencies can fine-tune and implement policy goals? There are many reasons why Congress does not legislate more specifically. For one, Congress is ill-suited both by expertise and by the nature of the institution to make the intricate decisions of statutory application. The number of House of Representative members has been locked in at 435 since 1911. The Senate has also stayed the same size even though more and more laws are on the books. More and greater delegations of broad policies seem like a necessity in this day and age. Also, Congress may not anticipate problems that will arise later. Thus, just because Congress may not have realized the full effect of burning fossil fuels and releasing greenhouse gases at the time it enacted the Clean Air Act in 1970, Congress did understand that without giving the EPA broad flexibility, the Clean Air Act might become obsolete. Yet frequent application of the more skeptical *King* standard of review might require Congress to amend statutes quite frequently to spell out its position on trending issues or at least to give agencies express authority to act (the necessary "clear statement"); otherwise, courts might regularly reject significant agency programs for lack of the necessary "clear statement." The prospect that Congress will step in to make a clear statement on any controversial topic, especially in today's political climate, is unlikely.

Perhaps, though, we need not fear that the *King* standard will paralyze agency actions because the more skeptical and less deferential scrutiny does not necessarily mean that an agency's program will be defeated; it simply means the agency has to work harder to convince the reviewing court of the

validity of the agency's choices. In fact even in *King* the agency eventually won – that is, the IRS decision about giving tax credits for healthcare exchanges created by the federal government, not just the states, was upheld – but not because the Supreme Court deferred to the IRS. Rather, the Court independently analyzed the overall statutory scheme and took a position that happened to jive with the agency's own position – reading "exchange created by the State" in context, rather than in isolation to ensure Congress's overall legislative plan for the healthcare exchanges was not foiled.

Ultimately, to answer the second key question, perhaps we can say that the *King* standard of review requiring greater scrutiny of significant agency programs is a compromise between two competing strains in American jurisprudence: on the one hand, the notion from *Marbury v. Madison* that the judicial branch – rather than the other two branches – has the authority to "say what the law is" and, on the other hand, the notion from *Chevron* that the executive branch, rather than judges, should interpret ambiguous statutes written by Congress. The *King* standard balances those two views by providing that the more important a statutory program is, the less likely a court will be to defer to an agency's interpretation of the statute and the more likely the court will be to read the statute in its own way. Less significant agency interpretations, by contrast, will continue to receive deferential review. This result makes sense if we recognize that the courts simply do not have time or expertise to second-guess all agency decisions, especially in the highly regulated world in which we live. In sum, in challenges to the most important agency programs, the Supreme Court will "say what the law is," and for the less important programs, the federal agencies will get to do so.

## Conclusion

The *King* case and the earlier *Brown & Williamson* and *Utility Air Regulatory Group* cases created a new standard of judicial review that could be called the "clear statement" requirement. These cases hold that Congress must speak clearly if it intends to delegate authority to agencies over programs of vast economic and political significance. This more aggressive standard does not necessarily mean that significant agency programs will always be struck down by the courts, but it does mean that an agency will have to convince a court outright of the merits of the agency's position, rather than simply asking the court to defer to the agency's expertise.

# Judiciary and Post-election Conflict Resolution and Democratic Consolidation in Ghana's Fourth Republic

William Asante and Samuel Adams
School of Public Service and Governance, Ghana Institute of Management and Public Administration, Accra, Ghana

## Synonyms

Election petition resolution; Electoral dispute settlement; Electoral grievance resolution; Post-election adjudication; Post-election crisis management

## Definition

Post-election conflicts may refer to crises or disputes arising from key electoral stakeholders after the declaration of results by the body charged with managing elections. Post-election conflict resolution on the other hand constitutes the efforts to peacefully resolve election-related disputes emanating from electoral stakeholders after an election is declared.

## Introduction

Over the last three decades though multiparty elections have defined the political landscape of most of sub-Saharan African (SSA) countries, political violence or controversy during and after elections remains a pervasive element of the democratic change sweeping the continent. Examples of the post-election controversies include cases in Ghana, the Democratic Republic of the Congo, Kenya, Mozambique, Uganda, Zambia, and most recently Gambia. It is in light of the controversies associated with African elections, that Omotola (2010) claims that most elections in Africa are mere rituals in which the votes count for little or nothing and that the best election riggers are the big winners. This pessimistic view is supported by Harding's (2015) description of African election as nothing more than a contest in ethnicity and corruption. Obviously, where democratic institutions are well established, prospects of electoral defeat should not be sufficient to motivate politicians to engage in violent electoral tactics.

It is surprising that not much attention has been given to the mechanisms (institutions) responsible for resolving post-election conflicts. This gap gives the rationale for this entry. The authors argue that the domination and centralization of executive power, weak, and dependent institutions of horizontal accountability (legislature, judiciary, national elections committee, general auditing commissions, and anti-corruption) are major challenges to consolidation of democracy. Furthermore, this entry contributes to the extant body of knowledge by focusing on the constitutional framework for electoral justice to provide an in-depth analysis of the complex and dynamic nature of post-election conflict resolution in Ghana. Specifically, this entry examines the significant role of the judiciary (Supreme and High Courts) in post-election conflict resolution in Ghana's presidential and parliamentary elections over the years. This entry is also in sync with the literature debating the significance of electoral institutions in mediating the risk of electoral violence and armed conflict more broadly (Fjelde and Hoglund 2014). The rest of the entry proceeds with a brief discussion on the nexus of democratic consolidation and post-election conflict resolution, the causes of post-election conflicts in Ghana, and the role of the courts and other important stakeholders in post-election conflict resolution, and then a conclusion is drawn with some policy implications.

## Exploring the Nexus Between Post-election Conflict Resolution and Democratic Consolidation

Definitions for democracy abound, however, it can be appropriately defined as a political system

that is characterized by popular participation, competition for executive office, and providing an institutional check on how power is to be exercised (Minier 1998). Also, the power of the majority of citizens to choose and remove governments cannot be underrated in a democracy (Gallie 1955). However, merely holding an election does not make a country democratic, since many African countries continue to do that with success. Consolidating democracy goes beyond competitive elections and Huntington's (1991) two turnover test to providing guarantees of civil liberties, broad citizen participation, and impartial institutions. On the other hand, post-election conflict may refer to crisis or disputes arising from key electoral stakeholders after the declaration of results by the body charged with managing elections. This entry identifies the rejection of the electoral results and the subsequent filing of petitions as the key embodiment of post-election conflict.

Many countries have put in place several mechanisms to deal with post-election conflict. For instance, Indonesia's politicians deliberately opted for the creation of a new court instead of handing the power of judicial review to the Supreme Court, probably because the sitting judges were perceived to be corrupt and incompetent (Horowitz 2006). The institutions charged with resolving these cantankerous conflicts may be divided into two categories consisting of regular constitutional courts charged with ruling in election-related cases and electoral courts, usually autonomous from the three branches of government (Eisenstadt 2002).

A renewed interest in democracy and its consolidation was envisaged when the African Union (AU) Constitutive Act replaced the Organization for African Unity (OAU) Charter – the open rejection for unconstitutional changes of government (Lamin 2011). Additionally, the AU together with other subregional continental groups have adopted charters and protocols on democracy, elections, and governance as a demonstration of Africa's seriousness toward the democratic consolidation journey. However, the revelation that violence has affected between 19% and 25% of African elections since 2000 (Bekoe 2010) defeats the above efforts and raises serious questions about the sustainability of democratic governance on the continent.

With this background, it becomes very important to identify ways to address post-election conflicts in emerging democracies, which according to Omotola (2010) include constitutional frameworks, power sharing, and electoral reform initiatives. Additionally, Mietzner (2010) and Horowitz (2006) claim that the court (judiciary) is a major stakeholder in democratic consolidation and has played positive roles in the stabilization of democracies. In the case of Ghana, it could be deduced that the neglect of the court in the post-1992 presidential election controversy may have led to the abortive resolution of that conflict that bedeviled the birth of Ghana's Fourth Republic. The consequence was the opposition parties' refusal to concede defeat in the presidential election and the boycott of the parliamentary elections (Boafo-Arthur 1995). This resulted in a one-sided parliament and affected the quality of governance. It is against this backdrop that this entry examines the role of the courts in post-election conflict resolution and the implications of their efforts for democratic consolidation in Ghana.

## Causes of Post-election Conflicts in Ghana's Fourth Republic

Every election comes with its own dynamics. The same can be said of post-electoral conflicts, which also may emanate from diverse causes. Ghana's case suggests that the causes of post-election conflicts include non-compliance of laws by EC officials and contesting candidates as recorded in the maiden presidential election petition (Asante and Asare 2017); the status of candidates, that is, whether they are qualified or not to contest in an elections, as in the case of the residential status of the MP-elect for Akim Oda Constituency after the 1996 parliamentary election; and the citizenship status of the NPP Bawku Central MP after the 2008 parliamentary election. The last but not the least cause of post-election conflicts in Ghana is the general misconduct of some EC officials and temporary staff as recorded in the Bawku Central and Bawku West Constituencies in the 1996 parliamentary elections.

## Role of the Courts in Post-election Conflict Resolution

To understand the role of the courts, it is important to give a brief background of the institutional framework for post-election conflict resolution in Ghana as set out by the Constitution. Article 1 Clause 2 of the 1992 Constitution of the Republic of Ghana stipulates the supremacy of the Constitution and that all laws should be consistent with its provisions. It must be highlighted that whereas the High Courts are responsible for parliamentary election disputes, the Supreme Court deals with that of presidential election disputes. Additionally, Article 99(1) of Ghana's 1992 Constitution states that the High Court shall have jurisdiction to hear and determine any question relating to the validity of the election of a member of parliament or the vacancy of the seat and the validity of the election of the Speaker of Parliament. Furthermore, the Constitution again provides that any individual who is not satisfied with the ruling of the High Court may petition the Court of Appeal for further redress (Article 99(2)). In the case of presidential elections, Article 64(1) provides that a citizen of Ghana can challenge the election of a president by bringing a petition to the Supreme Court within 21 days after the declaration of the result of the election in respect of which the petition is presented and that a declaration by the Supreme Court that the election of the president is not valid shall be without prejudice to anything done by the president before the declaration of the said election results (see Article 64(2) of Ghana's Constitution).

To complement the above constitutional provisions is the Representation of the People Law 1992 [Act 284], which throws more light on who qualifies to present a petition (section 17), the time for presentation of the petition (section 18), reliefs which may be granted (section 19), and grounds for cancelling election results (section 20), among others. The following paragraphs discuss the important role of the courts in Ghana's post-election resolution efforts over the years.

### Clarification of Some Electoral Laws and Procedures

Since the beginning of the Fourth Republic, the courts have clarified most of the ambiguities surrounding the country's electoral laws. One of these was the Asutifi South Constituency case which traveled from the High Court to the Supreme Court in 2009. The question that the Supreme Court sought to answer during this trial was "does the High Court have jurisdiction to entertain any election petition under Act 284 before the EC has declared the results of that election?" The answer by the Supreme Court was an emphatic no, with the reason that an election petition was supposed to be presented within 21 days after the declaration of the results by the EC and the results published in a public newspaper or the organization's official paper. Anything short of this is premature and could not be seen as an election petition (Act 284, section 18(1)). Similar incident occurred in the Akwatia Constituency.

### Dealing with Specific Cases of Election Petitions

In the Wenchi West Constituency, for instance, the Sunyani High Court had to dismiss a petition filed by one of the aspiring parliamentary candidates, Mr Joe Danquah of the NPP who prayed the court to order a fresh election in the Constituency. He alleged that his opponent (Mr Asiedu-Nketiah) committed an act of fraud which affected the results because the District Election Officer did not comply with the provisions of Act 284. His contention was that his opponent used his personal vehicle to assist the EC convey ballot boxes containing cast ballot papers from the polling center on the Election Day. Again, his opponent distributed cash, rice, and flashlights to some registered voters in the Constituency to secure votes in the election. Even though Mr Danquah may have had a case, his petition was premature as such was not entertained by the court. Credibility of the court system can therefore be said to be a major stabilizing factor in Ghana's democracy. This is consistent with the view of Fjelde and Hoglund (2014) that election-related institutions are crucial in reducing the incentives for electoral violence between political actors. These institutions motivate actors to comply with rules and to accept defeat because of the perception that losers will still be allowed to advance their interests in the future.

On the issue of contestation of the qualification status of candidates, a cattle farmer, Mr. Sumaila Biebel, in March 2009 filed a suit at an Accra Fast Track High Court challenging the eligibility of the newly elected NPP MP for Bawku Central Adamu Sakande on the grounds that the MP held dual citizenship, to wit both British and Burkinabe. Following this petition, the MP was ordered by the court to vacate his seat; he was subsequently jailed for holding dual citizenship, forgery of passport, and deceiving public officers to be elected as MP.

## Other Stakeholders Roles: Legal Practitioners, Politicians, and EC Staff

The observed evidence suggests key stakeholders such as legal practitioners, politicians, and the EC have all played diverse roles in Ghana's post-election conflict resolution efforts since the commencement of the Fourth Republic.

### Voluntary Withdrawals of Petitions

The data gathered brought out the fact that some of the legal practitioners together with their clients' politicians upon realizing their mistakes graciously withdrew their petitions. Examples are the NDC candidates for Akropong and Akwatia constituencies in the 2000 parliamentary elections and the NPP parliamentary candidate for the Effutu Constituency, among others.

## Conclusion and Policy Implications

Democratic consolidation consists of efforts to prevent democratic breakdown as actors subject themselves to the laid down rules in resolving conflicts. This entry reveals that Ghanaian politicians are devotedly making use of the available legal regime to resolve election-related disputes. It is noted that since 1996, election-related conflicts have been filed at the various High Courts in the country. However, the unfortunate incident is that most of these petitions had to be dismissed or struck out from the courts because of procedural errors. Further, these occurrences have been a great learning experience for Ghana, in the sense that most legal practitioners, EC officials, and politicians have learnt the rudiments of these post-election conflict resolution procedures. It is therefore not surprising that the maiden presidential petition did not suffer any procedural errors.

Finally, it is appropriate to mention that the courts have also learnt and consequently become innovative. Some of the significant reforms include written witness statement replacing oral statement and making the courts more accessible by, for example, making the election petition process very transparent by streaming procedure live on television. In like manner, the EC has also contributed to the reforms and therefore consolidation of democracy in Ghana, for example, the need to recruit competent returning/presiding officers who swear before a circuit court magistrate before commencing their duties.

It is without doubt that in Ghana's Fourth Republic, politicians are more likely to seek the assistance of the courts rather than the use of other means such as vandalism, boycotts, and violence to settle conflicts. Furthermore, the courts specifically the Supreme and the High Courts have steadily exhibited maturity in their dealing with post-election conflict resolution issues. They have succeeded in clarifying electoral laws and procedures and again provided the platform for legal practitioners, politicians, and the EC to learn by being active stakeholders in the process. It has also been identified that most of the legal practitioners did great disservice to their clients as most of the counsels did not get the court procedures right. This entry concludes that counsels for respondents should constantly update their knowledge of electoral laws and EC officials should go through rigorous routine training for its staff and reduce logistical challenges.

## K-12 Education as Social Policy

Jenny Sue Flannagan
Regent University, Virginia Beach, VA, USA

### Synonyms

Education; Education as social policy; K-12 Education; School districts; Schools

### Definition

K-12 education as social policy refers to the relationship between social policies in the federal/state/local government and the use of K-12 educational policies to move forward social policies.

### Introduction

In 2015, the annual budget for the United States was 3.8 trillion. Out of the 3.8 trillion, the discretionary spending for education was 69.98 billion dollars. It was the third largest section of the federal budget in that year. On average, the United States contributes 5% of its gross domestic product (GDP) to public education. State governments in the US contribute on average 48% of the overall cost, while local communities pay for 44% (U.S. Education Spending 2016). Apart from national defense, no other government program is considered more valuable than exposing young people to high quality education.

Since the beginnings of education in the United States and more specifically back in the early 1700s, the fundamental goal of education has been to pass on to each child the knowledge and skills he or she will use throughout his or her lifetime. While schools are often thought of as places where children learn the knowledge adults already know (Hu and McMahon 2010), schools also serve the purpose of teaching young minds how to critically analyze and evaluate information.

Socially and economically investing in public education means those individuals who graduate and have had access to quality education throughout primary and secondary school are more likely to find employment, have stable families, and be productive citizens. Research has also pointed out that investments in public education can lead to a reduction in serious crimes, less demands on the public health system, and fewer enrolled in welfare assistance programs.

Education in the United States has been historically different than other countries. Federalism governs how the United States oversees education. This essentially means there is a sharing of power between the states and local governments who are in charge of education. Up until the twenty-first century, the federal government has had little control over educational decisions. Most decisions have been made at the state or local

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

level. The US educational system allows a choice between public, private, or homeschool options for parents. The major difference between public and private schools comes down to funding. Public schools receive government funding and are subject to rules and regulations to ensure that the funds are used appropriately while private schools receive no government funding.

As the United States has grown both as an economic superpower and in the number of citizens that live within her border over the last several centuries, so too has the understanding that education serves a larger purpose than just spreading knowledge and skills. Public education is the only institution in the United States that has the capacity to reach a majority of her citizens. It is far more cost effective for our national government and states to invest in public education than to pay for the social and economic consequences of under-funded low quality schools.

Social policies are developed by the government, and their actions are intended to provide a basic level of assistance with income, safety, education, housing, and health care for certain categories of people at risk. According to Cheyne et al. (2005), "social policy might also be described as actions that affect the well-being of members of a society through shaping the distribution of and access to goods and resources in that society." (p. 3) History shows that because public education reaches so many of our students, social policy agendas have been advanced due to the educational system. To better understand this relationship, one must explore the history of education to understand the connection between education and social policy.

## Brief History of K-12 Education in the United States

Mention the word education and various images come to mind. Young people getting on busses and attending school where they are taught by many teachers throughout the years. Students take math, science, reading, history, and many other subjects. Some students attend specialized schools where they learn trade skills, while others may have the opportunity to attend specialized academies where they learn the latest skills in engineering and computer technology. Around 17 or 18 students graduate and either go to college or they enter the workforce. This is the typical view of education in the twenty-first century, but go back in time four centuries ago and the image of the educational system will look vastly different than today.

The US educational system began sometime in the mid-1600s and depending on where one lived, the educational experience was vastly different. In the north, the Puritans were known for their value of education, both for the sake of religious study and economic success. The Boston Latin Grammar School, the first American high school, was founded as early as 1635 to prepare young men for college at Harvard and service in the government and the church. By 1647, Massachusetts had passed a law mandating that every town of 50 or more families support an elementary school and every town of 100 or more support a Latin, or grammar school. These grammar schools were places where boys could learn Latin in preparation for college, ministry, or law. Both boys and girls attended schools and they learned to read, write, as well as study religion. In the mid-Atlantic states, private and public schools were common as the New England schools (Axtell 1974). Further south, however, few schools were found. In wealthy homes, children studied with private tutors while middle class siblings learned to read from their parents. Many poor and black children went unschooled. This contributed to low literacy levels in the south than in the north. (Bailyn 1960).

In the early 1700s, elite prep schools opened to train boys to go into the Ivy League colleges. Girls at this time did not receive a free education and the education they did receive was basic literacy and female grace skills. The flourishing of elementary education would occur in succeeding generations. Secondary education, i.e., high school, however, would take longer to take root. It would not be until nearly 200 years later (1821) that the first public high school, Boston English High School, would open its doors to all students. (Boyer 1983).

It was during the middle 1800s changes in the early educational systems began to emerge. In 1837, Horace Mann set forth his vision for "free" schools. His establishment of a statewide system of education in Massachusetts began the modern day educational system. In 1867, the original Department of Education was created to collect information on schools and teaching that would help the states establish effective school systems. Department of Education was created in 1867 to collect information on schools and teaching that would help states establish effective school systems. The Federal government's role was that of serving as an information collector. It would collect information about schools, students, funding, and programs available in the nation. By 1870 all states had locally controlled, tax-supported schools. However, while elementary education had spread rapidly in the early 1800s, only 500 public high schools were open in 1870.

While all children who have reached age six to eight are required in the USA today (depending on the state) to attend either private or publically funded institutions, this was not always the case. Sixteen states had compulsory-attendance laws by 1885, but most of those laws were sporadically enforced at best. All states had them by 1918. By 1952 Massachusetts had put into law a mandatory attendance act. This law specified that children between the ages of eight and fourteen had to attend school for at least 3 months out of each year. Out of those 12 weeks, at least six had to be consecutive. Most states also had robust policies regulating schools. By 1919 all states had transportation laws governing how children arrived to and from school.

Students enrolling in high school in the nineteenth century were not necessarily all prepared for college. While college preparatory schools still existed, many vocational training schools began to increase. During this time, parents and students saw this new "vocational education" as a shortcut to acquiring skilled jobs in the factories and agricultural enterprises.

By 1940, there were over 117,000 school boards in the United States with states remaining in control of education. Today there are about 14,000 school districts. Each of those school districts is overseen by a local school board. Each state has a state school board, plus boards found in the District of Columbia and territories (Ravitch 2014, p. 278).

## History of Key Social Policy Initiatives Related to Education

As the educational system grew and evolved over the last four centuries, changes in our country's role of government in developing policies that impacted society changed as well. Over the course of the United States' history, social policies have been enacted to respond to rapidly changing needs in the country. In many cases, one might argue education has been the vehicle used to enact social policies that brought about changes to the very fabric of democracy here in the United States. Several major social policies education helped to move forward the US motto of e pluribus unum (out of many, one).

### Education for All Students

In 1863, America was still healing do to the conflict of the civil war. For years, African Americans were not able to vote and many, particularly in the south, were not educated. Although President Abraham Lincoln signed the Emancipation Proclamation which ended slavery in the United States, this did not necessarily mean blacks were considered equals to whites. In 1896 the US Supreme Court case upheld the constitutionality of segregation under the "separate but equal" doctrine. It stemmed from an 1892 incident in which African-American train passenger, Homer Plessy, refused to sit in a Jim Crow car thus breaking a Louisiana law. Rejecting Plessy's argument that his constitutional rights were violated, the Court ruled that a state law that "implies merely a legal distinction" between whites and blacks did not conflict with the 13th and 14th Amendments.

By the 1950s compulsory education was well established although the K-12 educational system was still in its infancy. Education was no longer just available to the wealthy; it was for all students

regardless of color. But there was a caveat to this notion that all students deserved an education. For 60 years, public education mirrored the view of society that races needed to be segregated from each other in terms of the use of public facilities. Beginning in the nineteenth century, state and local governments passed segregation laws known as Jim Crow Laws. Jim Crow was the name given to define a racial caste system (a social structure within countries based on what families you are born into (i.e., being born into poverty means you will always be poor). This "system" operated primarily, but not exclusively, in southern and borders between 1877 and the mid-1960s. This system defined African Americans as second-class citizens and was essentially a way of life (Margo 1990). Jim Crow was more than a series of rigid antiblack laws. It was a way of life. Under Jim Crow, African Americans were relegated to the status of second-class citizens (Margo 1990).

In 1869 the Supreme Court upheld this notion when they issued their verdict in the Plessy v. Ferguson case, which held that as long as the separate facilities for the separate races were equal, segregation did not violate the Fourteenth Amendment ("no State shall... deny to any person... the equal protection of the laws"). The court stated that even though factors such as facilities, teachers, and supplies were equal, separation itself was inherently unequal and a violation of the equal protection clause of the 14th amendment.

In 1951 a class action lawsuit was filed against the Board of Education in the City of Topeka, Kansas, calling for the school district to reverse its policy of racial segregation. Since 1879, the Topeka Board of Education had operated separate elementary schools in twelve communities. The District Court in Kansas sided with the school board. When the case reached the US Supreme Court, it was a combination of five cases (Brown, Briggs v. Elliott, Davis v. County School Board of Prince Edward County, Gebhart V. Belton, and Bolling V Sharpe). On May 17, 1954, the Supreme Court handed down a unanimous (9–0) decision that "separate educational facilities are inherently unequal."

### Educating Immigrants

During the first decade of the twentieth century, America had the largest number of immigrants coming to her shores in the hopes of a better life. Propelled by the rise in manufactory jobs due to the Industrial Revolution, over 16.3 million people arrived between 1900 and 1910. Suddenly life in America changed from primarily farms and towns to more densely packed urban areas. Education was changing as well within the federal government.

The federal government passed the Smith Hughes Act in 1917. This act created the Federal Board for Vocational education. Its goal was the promotion of training in agriculture, trades and industries, commerce, and home economics in secondary schools. As part of the act, these federal grants-in-aid had to be matched by state or local funds. State boards were required to submit a state plan for how the funding would be used and they had to agree to four conditions (Swanson 1951). These four conditions outlined in the legislation required that (1) the federally aided program of vocational education would be under public supervision and control; (2) the controlling purpose would be to fit students for useful employment; (3) vocational education would be of less than college grade and designed to meet the needs of persons over 14 years of age who had entered or who were preparing to enter the occupation for which they were receiving training; and (4) the state or local community would provide the necessary plant and equipment (Roberts 1957, p. 132).

### Social Policy Expanding Role of Federal Government

Another influential legislative act was created in 1958. The National Defense Education Act (NDEA) was passed by Congress and signed into law by President Dwight D. Eisenhower on September 2, 1958. This legislation provided funding to improve American schools and to promote postsecondary education. The goal of NDEA was to improve and strengthen all levels of the American school system and to encourage students to continue their education beyond high school. There were provisions within the law that

included scholarships and loans to students in higher education, for those students who were preparing to be a teacher, and for those students who showed promise in the fields of mathematics, science, engineering, and modern foreign languages. States received grant funding specifically for public schools to use within academic programs such as mathematics, science, and modern foreign languages. The law also included funding to improve the teaching of languages. Several other funding areas were included as well.

The 1960s were a decade of major social change in the USA. Another major federal social policy was enacted on April 9, 1965. The Elementary and Secondary Education Act (ESEA) developed under the principle of redress, which established that children from low-income homes required more educational services than children from affluent homes. As part of the Elementary and Secondary Education Act, Title I Funding allocated one billion dollars a year to schools with a high concentration of low-income children. The legislation also provided funding to expand access to students with disabilities although it did not expand access to all students. Since 1870 Congress had been trying to pass a school bill for all of America's children. This was the first significant step in the twentieth century to provide assistance to all children in public schools. Around the same time Congress also created Head Start – a preschool program for children in poverty (Ravitch 2014, p. 280). This program provided free lunch to those in need.

In the 1970s the government passed Title IX, which stated that no person could be excluded from a school program on the basis of his or her sex. This provided opportunities to more women athletes and other opportunities for women that were not previously granted. Congress also established in 1979 the US Department of Education. This was the first time education was raised to a cabinet-level position. Also during this time two bills opened up educational access to students with disabilities. The All Handicapped Children Act (EHA) established the right to a public education for all children regardless of disability. The second act passed was the Individuals with Disabilities Education Act (IDEA), which required schools to provide individualized or special education for children with qualifying disabilities. Any state that accepted public funding had to provide special education services.

Education continued to change during the 1980s. In 1983, a presidential commission, consisting of 18 members from the private sector, the government, and education were assessing the "quality of teaching and learning" at the primary, secondary, and postsecondary levels in both the public and private spheres in order to compare American schools and colleges with those of other advanced nations. Upon completion the report contributed to the assertion that American schools were failing.

Beginning in the twenty-first century, President George W. Bush signed into law the No Child Left Behind Act (NCLB). NCLB updated the 1964 Elementary and Secondary Education Act. This piece of legislation sought to continue to advance the competitiveness of America by focusing on closing the achievement gap between poor and minority students and their advanced peers. This law required school divisions to annually test students in grades 3–8 in math, science, and reading. School divisions were also required to meet annual yearly progress goals. This law grew out of concerns that the American educational systems was no longer competitive internationally. In 2009 President Obama released Race to the Top funds, which spurred the development of Common Core Learning Standards. President Obama in 2010 released his own blueprints for revising the NCLB law as well as offering states more flexibility in not operating under the law.

## K-12 Education's Reflection of Social Policy

Early philosophers such as Plate, Aristotle, and Socrates believed education was central to life. Education was how one attained knowledge. To Aristotle, however, education was more than just the acquiring of knowledge. It was also important to the attainment of happiness or goodness in life. Over the last decades, research has supported the

idea of happiness and an overall flourishing society. Putnam (2000) articulated:

> Education is one of the most important predictors-usually, in fact, the most important predictor of many forms of social participation from voting to associational memberships, to chairing a local committee, to hosting a dinner party to giving blood. The same basic pattern applies to both men and women and to all races and generations. Education, in short, is an extremely powerful predictor of civil engagement. (p. 186)

While education is the primary way to train children in the skills they will need when they become adults in order to find employment in order to live (Grossman 2006), education also has broader impacts for society at large. An educated population is able to critically think and use information to make informed decisions (Martinez 2000). Education opens the door for access to higher education, thus allowing people to enter the work force earning a higher wage (Snow 1982). This leads to sustained productive employment and the ability to make effective choices regarding life in general.

Education, however, does not operate in a vacuum. Because of this fact, over the course of the last two centuries, as society has changed, so too has education. Sometimes these changes were driven from outcomes of judicial decisions, while others came as a result of historical events that have impacted the United States. In both cases, how education in this country is being done today looks radically different than when it began.

## Impact of Judicial Decisions on Education

Since 1789 the nation's court system has been designed to fulfill a system of checks and balances in order to maintain how democracy works in the United States. The tenant of any court in the United States is to uphold the Constitution by striking down laws that go beyond those rights established within the constitution or limitations on government power. The judiciary is also charged with interpreting laws and applying them to individual situations and how the meaning of laws can be applied. When judges rule laws or government actions that violate the spirit of the Constitution, they profoundly shape public policy. Perhaps the most profound ruling to change the course of education was the decision of Brown v. Board of Education in 1954.

The United States entered into a time of rapid change and growth through many social policy initiatives during the 1950s. The USA was undertaking the creating of an interstate highway system; suburbs were growing, and family life was changing as well. It was not uncommon for households to have two cars. Color televisions were becoming the norm. Advances in medicine such as the polio vaccine changed forever the future lives of children and advanced the notion of developing vaccines to cure diseases.

The 1950s were also a time when more and more citizens began to seek a change towards a more equalitarian society where everyone had equal rights as outlined in our founding documents. It was 1 month before the launch of the Russian spacecraft Sputnik where Americans saw the first civil rights legislation since the reconstruction. Both events – the movement towards an equalitarian society and the Russians beating the USA to the space race – drove changes in education.

While the education of a child begins first in the home, when they enter school their schools become places that are in essence microsocieties. In other words, they often times reflect views of a larger society. Prior to the 1950s, schools in America were segregated. The landmark Supreme Court case Plessy v. Ferguson upheld the constitutionality of state laws requiring racial segregation in public facilities under the doctrine of "separate but equal." When the high court gave its unanimous decision to rule that separate but equal was not constitutional, it did so by pointing to the fact that research had shown that significant psychotically and social disadvantage were given to black children from the nature of segregation itself even if the schools were of equal quality in facilities and teachers. Even though this ruling was historic, it would take many more years for desegregation to be put into place. It would not be until President Lyndon Johnson in 1964 signed

the Civil Right Act that the government would begin pushing to integrate schools by threating districts that did not comply by withholding federal funds and lawsuits.

## Major Events in History Impacting Education

Just as judicial outcomes can shape education, so too can legislative outcomes. One of the first major legislative policies to affect changes in education was due to the relationship between the influx of immigrants and the Industrial Revolution. The Smith-Hughes Act was legislation that was created in response to a complex set of social, economic, and political forces and established the Federal Board for Vocational Education. Prior to the passing of the Smith Hughes Act, the federal government had given to Land Ordinances (1785 and the Northwest Ordinance of 1787) which did suggest some of the money be used for education although Congress did not prescribe the funds to be used only for schools. With the Smith Hughes Act, however, the federal government put a set of restricting guidelines on the money. In the act States had to create a "state plan" for how the funds would be used. This plan was really a contract between the Federal Government and the States, which would assure adherence to Federal requirements and procedures. Some argue that while this law did a great deal to advance vocational education in the United States, unintended consequences seen later coupled with other legislation gave rise to tracking students that tended to capitulate the differential treatment of students based on class and race. For example, African-American students were often guided into vocational education programs on the assumption they were not capable of academic training or would not be hired for jobs that required it.

While the Smith-Hughes Act impacted vocational education, another historical event impacted multiple areas within the educational system. The object involved at the center of this historical event was rather small, but the long lasting implication hugely changed education. On October 4, 1957, a tiny satellite, not from the USA orbited the earth for the first time. Sputnik made history. Not just because it was the first man made object to travel in space around the earth, but because it was Russian. Although America would eventually land a man on the moon, the Russians had beat the United States and signaled they had the rocket technology to launch bombs at the United States. This event put a spotlight on a serious problem – many felt the US educational system was failing. In order to improve it, major changes in both instruction and curriculum had to take place. This led to the creation and passing of the National Defense Education Act (NDEA) on September 2, 1958. This act provided funding to improve American schools and to promote post-secondary education. The goal of the legislation was to strengthen the areas of science and technology in the country's educational system in order to meet the demands for America to compete with the Soviet Union.

Apart from the Brown v. Board of Education, this was the first major act and the beginning of major involvement of the federal government in education. Those against the legislation worried this would mean that funding provided by the federal government would again come with restrictions and would shape educational policy. Other critics felt the bill was too limited in only focusing on science and technology while also putting more scientists instead of educators in charge. Even further, some singled this was political strategy to gain more control over state controlled education.

Many felt the Elementary and Secondary Education Act (ESEA) of 1964, as with the NDEA, was another means of the government gaining more control over education. After Kennedy's assassination, Johnson decided to respond to civil rights pressures and religious conflicts over education by linking educational legislation to his "War on Poverty." The ESEA was the first time the government switched from general federal aid to education towards categorical aid, and the tying of federal aid to national policy concerns such as poverty, defense, or economic growth. But the bill did something more. ESEA gave the federal government a way to take an aggressive role in enforcing the Civil Rights Act of 1964 by

threatening to withhold federal funds from districts that failed to desegregate their schools (Ravitch 2014, p. 280).

In 1983 a little report entitled "A Nation at Risk" once again put education in the spotlight. This report began a decade of major change in the role of the federal government in education. For the first time in history when Bush signed into law No Child Left Behind (NCLB) in 2001, the federal government was in the driver's seat (Ravith, 281) when it pertained to education. If school districts or states wanted to change their plans in order to meet federal goals of the NCLB law, they had to seek permission from the federal government to do so.

Backlash towards the bill has been growing over the last decade and was part of the reason President Obama in 2009 signed into law Race to the Top which was a competitive grant program that set aside 4.35 billion to encourage states to support education innovation. But within the guidelines the federal government, specifically the US Department of Education, demanded states follow certain guidelines if they wanted to win a share of the money. This grant program would eventually lead to teacher evaluations including the use of test scores and the creation and adoption by states of the Common Core Standards.

## Final Thoughts

As evidenced by the large amount of money set aside to be spent on education annually, most Americans understand that paying for the education of the nation's children is a civic duty and an investment in the future of our great nation. Public education has played a role in expanding the democracy of the United States. While those changes were driven by both judicial and legislative actions, nonetheless, the public schools have helped to assimilate the millions of immigrant children who came here and still come here for a better life. They have learned English in our public schools and have participated in American democracy. All children, regardless of their skin color, sex, or disabilities, have been given the rights to be educated. As Diane Ravitch so eloquently points out, public education is the only institution that has done all of these things over the last three decades. Ravitch (2014) states,

> More than any other institution in American life, the public schools have broken down the barriers of class, race, religion, gender, ethnicity, language, and disability statues that separate people. They have not eliminated those divisions, but they have enabled people from different walks of life to learn from one another, to study together, play together, plan together, and recognize their humanity. More than any other institution in our society, the public schools enable the rising generation to exchange ideas, to debate, to disagree, and to take into account the views of others in making decisions.
>
> Over time as the public schools have opened their doors to all, they have strengthened our nation by expanding opportunities to more people as well as distributing the benefits of knowledge to more people. Public education has been an American melting pot, an American salad bowl, an American orchestra, and an American mosaic. The public schools have taught us how to be one society and not a collection of separate enclaves divided by race, language, and culture. They have contributed directly to the growth of a large middle class and a dynamic society. Our nation's public schools have been a mighty engine of opportunity and equality. (pp. 323–324)

As society continues to change, education must also change in order to meet the new demands. But what should not change are the overarching purposes of education – to provide young people in the United States with the knowledge, skills, and a love of learning so they can become informed citizens who are able to solve incredibly complex problems. Education will also be about preparing future citizens. Public education is essential to the democracy of the United States.

# Kantian Ethics

James C. Clinger
Department of Political Science and Sociology, Murray State University, Murray, KY, USA

## Synonyms

Deontology; Duty; Kant; Morals

## Introduction

Immanuel Kant was one of the most notable philosophers of the Enlightenment. His work has had significant impact upon modern metaphysics, epistemology, moral philosophy, theology, and ethics. His works are not often read by public administrators in contemporary times, in part because Kant's writings can be pretty difficult reading, even though many short, pithy quotations from his works are quite memorable. It should also be noted that some of Kant's ethical demands are too stringent for public administrators attuned to a more relativistic world view. It is Kant's ethical work that will be examined here. Much more extensive discussions of Kantian ethics can be found elsewhere, but this essay will primarily address the applicability of Kantian thought to public administration theory, teaching, and practice.

## The Major Features of Kant's Moral Theory

Kant lived from 1724 to 1804, so he could see not only the development of Enlightenment thought in the writings of the social contract theorists and British empiricists, but he could see the political manifestations of Enlightenment ideas in Europe and in North America. He could see the repercussions of these ideas in the seventeenth century revolution in England and in the American and French revolutions that occurred in his lifetime. He departed from the British empiricist philosophers by denying the existence of a *tabula rasa* on which real-world experiences could be drawn, and, unlike the social contract theorists, he saw no point in positing a state of nature from which a civil society could emerge to protect individual rights that he could not observe. His work preceded that of the most prominent utilitarian theorists, such as Bentham and Mill. While many of the contemporary or subsequent theorists favored a consequentialist ethical framework, a duty-based or deontological approach was the basis for his thinking. For Kant, one should start with a minimum of basic assumptions in devising an ethical framework. In particular, one should not take for granted that any particular set of actions are inherently good. No external authority such as tradition or religion could be trusted to provide guidance regarding what behaviors were good or bad. Such conclusions could only be reached through application of reason to the question at hand. Kant regarded "good will" as the only inherently

"good" value upon which one could rely. Upon that basis, Kant derived his famous categorical imperative, which commands that individuals should "Act only according to that maxim whereby you can at the same time will that it should become a universal law" (Kant 1785 [1959], p. 21). This precept was to be a universal maxim, not contingent upon time or place or circumstance. Kant also devised somewhat similar principles that are often seen as variations on the original categorical imperative formulation. Among these was the so-called Principle of Humanity which stipulates that one should "act as to treat humanity, whether I thine own person or in that of any other, in every case as an end withal, never as means only" (Kant 1785 [1959], p. 56). Another formulation was the "Kingdom of Ends Formula" that asserts that "every rational being must act as if he were by his maxims at all times a lawgiving member of the universal kingdom of ends" (Kant 1997, p. 45).

In addition to these formulations of the categorical imperative, Kant also developed heuristics that would offer some help in applying the categorical imperative. Among the more famous was Kant's formulation of the publicity principle articulated in *To Perpetual Peace*: *A Philosophical Sketch* (1795 [1983]). In the section entitled "On the Agreement between Politics and Morality under the Transcendental Concept of Public Right," Kant claims that "all actions relating to the right of other human beings are wrong if their maxim is incompatible with publicity" (1795/1983, p. 135). If the maxim behind certain conduct cannot be "openly divulged without at the same time defeating my own intention" by raising opposition to the plan, then the idea must be unjust (Kant 1795 [1983], p. 135).

Finally, Kant had much to say about the distinctions between obligation under the law and duty to act ethically once legal obligations are met. In his brief essay, "What Is Enlightenment?" Kant highlighted what an enlightened scholar could do through "the public use of one's reason." For Kant, a "private use" [is]

> that use which a man makes of his reason in a civic post that has been entrusted to him. . . . Here arguing is not permitted: one must obey. Insofar as a part of this machine considers himself at the same time a member of a universal community – a world society of citizens – (let us say that he thinks of himself as a scholar rationally addressing his public through his writings) he may indeed argue, and the affairs with which he is associated in part as a passive member will not suffer. Thus it would be very unfortunate if an officer on duty and under orders from his superiors should want to criticize the appropriateness or utility of his orders. He must obey. But as a scholar he could not rightfully be prevented from taking notice of the mistakes in the military service and from submitting his views to his public for its judgment. The citizen cannot refuse to pay the taxes levied upon him; indeed, impertinent censure of such taxes could be punished as a scandal that might cause general disobedience. Nevertheless, this man does not violate the duties of a citizen if, as a scholar, he publicly expresses his objections to the impropriety or possible injustice of such levies. A pastor, too, is bound to preach to his congregation in accord with the doctrines of the church which he serves, for he was ordained on that condition. But as a scholar he has full freedom, indeed the obligation, to communicate to his public all his carefully examined and constructive thoughts concerning errors in that doctrine and his proposals concerning improvement of religious dogma and church institutions. This is nothing that could burden his conscience. . . . . Therefore the use which a scholar makes of his reason before the congregation that employs him is only a private use, for no matter how sizable, this is only a domestic audience. In view of this he, as preacher, is not free and ought not to be free, since he is carrying out the orders of others. On the other hand, as the scholar who speaks to his own public (the world) through his writings, the minister in the public use of his reason enjoys unlimited freedom to use his own reason and to speak for himself. That the spiritual guardians of the people should themselves be treated as minors is an absurdity which would result in perpetuating absurdities. (http://www.columbia.edu/acis/ets/CCREAD/etscc/kant.html, retrieved 9/27/2016)

In this way, Kant has reconciled obligations to fulfill a role that he or she has accepted in society, but retains the duty to speak publically with conviction "as a scholar" once the private responsibility is completed.

## Implications for Public Administration

The impact of Kant's work has been very dramatic within philosophy and moral theory. Perhaps, most obviously, his effort to compel individuals to abstract their own interests from particular decisions bears a resemblance to John Rawls' urging that decisions be made behind "a veil of

ignorance" regarding what one's personal interests might be (1971). However, within public administration as a whole, and specifically within the subfield of public administration ethics, Kant's legacy is a bit mixed. Kant's directives to make reasoned decisions that are universalizable, without regard for one's own interest, seem consistent with various codes of professional ethics and conflict of interest laws that prevent or at least discourage decision makers from profiting materially from the choices that they make. That focus on the interests of all and not just one's own interests also seems compatible with the frequent appeals to "the public interest" in public administration. Kant's distinction between private and public reason in "What Is Enlightenment?" seems to support traditional public administration beliefs that bureaucrats must carry out their governmental roles even if they do not necessarily agree with the commands that they follow. At the same time, Kant urges individuals in public positions as "scholars" to announce publically what they believe. This precept corresponds to Wildavsky's support for policy analysts to "speak truth to power" (Wildavsky 1979). Finally, Kant's publicity principle, which he regarded a "transcendental" law, seems generally consistent with the presumption toward transparency reflected in open meetings and open record laws (see Clinger forthcoming 2016).

Nevertheless, Kant's influence on ethics in public administration has some definite limits. As noted above, some of the Kantian arguments are a bit hard to follow. Also, some of Kant's German prose does not easily translate into English. But Kant's limited impact cannot wholly be attributed to matters of style or language. Public administration scholars and practitioners tend to be of a practical bent of mind. Sometimes Kant's formulations appear to be formal arguments that inspire but which do not always make practical sense. For example, Kant's ethical system is categorical and universal. Much of contemporary examination of ethical controversy is concerned with hypothetical and system-specific controversies. Many ethics scholars in public administration, for example, follow John Rohr's "regime values" approach (1998), which involves expectations that administrators will become aware of and follow the core values of the regime in whose service they work. Rohr does not reject universal values, but believes that administrators have a duty to uphold the values of the constitutional order they have taken an oath to defend.

Many critics of Kant's ethical theory have frequently complained that the command in the categorical imperative to act as if each action were to become the basis for a universal law is a bit naïve. Not everyone will follow the universal law, so perhaps choices made by ethical people should anticipate these deviations. This problem can perhaps most obviously be seen in Kant's prohibition of lying. Obviously, lying is generally regarded as morally wrong. However, Kant seemed to tolerate no exceptions to the prohibition on lying, no matter what the consequences. In fact, Kant could not even justify a lie told to a "murderer at the door" who inquires about the location of a potential murder victim (see Varden 2010; Mahon 2006). These extreme circumstances would justify a lie or at least deception, in the minds of many ethicists. In the realm of public administration, law enforcement officers are frequently expected to use deception in interrogations and in undercover operations. In the more conventional, more utilitarian view, a lie to someone who bears ill will could be permissible under some circumstances.

Finally, in recent years, there has been some effort to step back from some of the more extreme efforts to separate tangible interest from the lives of civil servants. For example, in the work of Anechiarico and Jacobs (1996), conflict of interest laws generally have placed so many procedural burdens upon public decisions that it is difficult to offer high-quality service. By the same token, agency bans on post-termination employment by the firms that agencies regulate may make it difficult to recruit and retain high-quality staff (Law and Long 2011).

# Key Issues in E-Procurement in Russia

Konstantin Igorevich Golovshinsky
National Research University Higher School of Economics (HSE), Moscow, Russia

## Synonyms

Contract; Electronic trading platform Russia; Russian E-procurement; Suppliers; The Russian Federation

## Definition

**E-procurement in Russia is the basic pipeline of the whole contract system. Unified information system is** "the heart of the contract system covering all stages of procurement, from the publication of the procurement notice to audit, monitoring and control of public procurement" (Country Case 2017).

## Introduction

In the Federal Law No. 44-FZ "On Federal Contract System," the key part is assigned to a unified information system in the sphere of purchases (further – UIS). UIS is a peculiarity of Russian public procurement and has to become the cornerstone element of all contract system. Unified information system gives opportunity to phase transition of all procurement procedures in an electronic form.

According to Art. 4 of the Federal Law No. 44-FZ, UIS provides the following services:

- Process information flow concerning planning and bidding stages
- Compliance control in public procurement
- Submission of bids in electronic form

Customers post on the official site EIS www.zakupki.gov.ru the following data and documents:

1. About purchase planning
2. Determination of the supplier (contractor, performer)
3. Performance of the contract
4. The volume of purchases at SME
5. Public discussion of purchases

## The Procurement Process

**So, at planning stage, the customer shall place the following documents and changes in them**:

1. Plan of purchases (3-year horizon)
2. Scheduled plan of purchases (1-year horizon)

**At bidding stage the customer places**:

1. Notification of a bid and its change (e.g., notification on carrying out request for quotation.

2. The customer doesn't place in UIS any information in case of carrying out the closed auction or the closed tender, except notification on its carrying out is held.
3. Notification on canceling of determination of the supplier.
4. Notification on extension of a term of applications for participation in request for quotation.
5. Notification on carrying out preliminary selection of procurement participants for the purpose of humanitarian assistance or mitigation of consequences of emergency situations.

The protocols of operation of the commissions are made out in case of implementation of purchases (e.g., the protocol of reviewing and an assessment of applications for participation in an open competition).

In case of running an electronic auction protocols of reviewing of requests and summing up, protocols go to the operator of an electronic trading platform. Further transmission of the protocol for placement in UIS is provided by the responsibility of electronic platform.

**At contract performance stage, the customer should place in UIS**:

1. Report on performance of the contract (its stage)
2. The decision on a unilateral refusal of the customer from performance of the contract
3. Information on cancellation (change) of the contract

All information, which is contained in UIS, is posted on the official site of UIS in the Internet (further – official site). So all data is public and is provided for free. Russian regions have an opportunity to create own regional information systems in the sphere of purchases integrated with UIS.

The analysis of the generally available information is posted on the official site; technological (operational) documentation of the official site revealed also the following problems:

1. Absence of unity of a cycle of purchasing activities: at the moment it is impossible to monitor a particular purchase from the moment of including it in the plan of purchases until performance of the contract.
2. Lack of integration of the budgetary and procurement processes. The budgetary and purchasing processes at the technological level are separate; then evaluating effectiveness of purchases is highly constrained.
3. Documents are posted on the official site in an unstructured way. It makes impossible the full-cycle hands-off processing of the information for the purpose of performance audit.
4. Inconvenient and difficult interface of the official site in use. In particular, inconvenient information search in public procurement. According to data of some pools, about 40% of customers consider that the most essential time and resource expenditure on implementation of purchases for them is wasted on meeting requirements to place all due information on the official site.

   At the same time, according to customers (19.5% of respondents), it is difficult for business entities to obtain different information on conditions and methods of participation in procurement.
5. A problem of display and information search about purchases on the official site, in particular:
   (a) The official site doesn't give the developed statistics on the terminated contracts – on the bases of cancellation of the contract (by agreement of the parties, unilateral refusal of the customer, unilateral refusal of the supplier, in a judicial or pre-judicial order).
   (b) Complexity of search of the concluded contracts. There is no opportunity to carry out search of the contract by its number.
   (c) There is no opportunity means of the official site to collect the aggregated statistical data on conducting examination of contract results.
   (d) There is no opportunity to monitor how the principle of innovation stimulation works. It is impossible by means of UIS to define whether the planned or conducted procurement is innovative and whether the planned purchase of an innovative object is realized.

(e) There is no possibility of sorting complaints by different bases in the register of complaints (whether the applicant, the procurement participant, the person exercising public control, another person, and so on) and also by other criteria.

6. Technical problems:
   (a) The official site is inaccessible very often due scheduled service.
   (b) Low productivity of the official site. For example, in peak hours every search inquiry is processed very long. The message that the website is temporarily inaccessible appears too often for the cornerstone information system of Russian public procurement.

Another main feature of Russian E-procurement system is that all bids in form of electronic auctions are held on electronic trading platforms. The general amount of government procurement budget traded on electronic platforms counts for 3.9 trillion rubles in 2016 (more than a half of all procurement budget). There are five accredited electronic trading platforms which operate in Russian public procurement market (data of 2016).

Their market shares in public procurement are presented in Table 1 (Mereminsky 2017).

According to Russian law, neither suppliers nor customers pay nothing to electronic platforms. For suppliers and customers, services of electronic trading platforms are free. At the same time, each bidder has to pay tender security (at a rate of up to 5% of the starting value of the contract). After holding a procedure, the tender security amount is reimbursed. The profit of the ETP is got due to placement of the remains built from constant flow of tender security payments in bank deposits.

**Key Issues in E-Procurement in Russia, Table 1** Market shares of different electronic trading platform in Russia

| No. | Title of electronic trading platform | Share, % |
|---|---|---|
| 1. | Electronic trading platform of Sberbank | 35, 6% |
| 2. | Electronic trading platform of Tatar Republic (region of Russia) | 2, 9% |
| 3. | RTS-tender | 28, 2% |
| 4. | Electronic trading platform of Moscow exchange | 7, 3% |
| 5. | Unified electronic trading platform | 26% |

Main "pros" for electronic trading platform involvement include:

- **Lack of personal contact between customers and suppliers**
  Before completion of a procurement procedure, the customer has no right to demand from suppliers of any identification. Anonymity is a necessary condition for competitive "fight" between suppliers for obtaining the contract.
- **Validity of transactions**
  All documents in the course of the electronic auction – from accreditation on trading platform to signing the contract – are vised by participants with the digital signature. It guarantees validity of transactions.
- **Geographical independence**
  It is possible to participate in the electronic auction from any point of Russia – Internet connection and the digital signature certificate are enough. To obtain information on new purchases and to submit the application for the competitive procedure, it is possible to sign the contract without leaving the office. It helps to expand geographical boundaries of business and to increase client base: any company placing orders on electronic trading platforms can become the provider.

But some problems connected with electronic trading platforms really exist. One of the main problem – lack of bidders' confidentiality.

The staff of electronic trading platforms actually possesses a wide range of opportunities for access to confidential information, for example, to the information about participants of electronic procedures at the time of passing of the procedure as well as to data on interest of bidders in a definite procurement procedure. Possession of this information is a fraudulent factor and can have negative consequences without appropriate regulation.

Development of regulations on ensuring confidentiality of information can be one of the possible ways of the solution of this problem. Regulations of ensuring confidentiality of information and the prevention of threats of unfair interference include:

- Requirements for presence at ETP of the qualified employees with education in the field of ensuring information security
- Requirements for regular audit of procedures of safety
- Requirements to procedure quick response to incidents
- List and contacts of persons, responsible for observance of regulations

Speaking about perspectives of development of information support of contract system, it is impossible to disregard an initiative about the development of system of comprehensive electronic procurement. Now the bill providing introduction of amendments to provisions of the Federal Law No. 44-FZ regarding a regulation of holding **all procedures (**not only auctions) of determination of suppliers (contractors, performers) imperatively electronically is adopted in the first reading at Russian Duma. At the same time, a subject of legal regulation of the bill is the relations concerning a regulation of procedures of determination of suppliers electronically (electronic procedures), including:

- Submission of requests in electronic form for an involvement in determination of suppliers, opening of access to such requests
- Formation of protocols of holding procurement procedures
- Signing of contracts

According to the bill, new methods of determination of suppliers in electronic form are fixed:

- An electronic open competition
- An electronic competition with a limited involvement
- An electronic two-stage competition
- An electronic request for quotation
- An electronic request for proposals

All bids are to be held on electronic trading platforms. Certainly, electronic procedures have essential advantages compared to old style procurement in paper form. Signing of contracts in electronic form when holding electronic procedures of determination of suppliers will be possible only on electronic platforms.

All document management will be performed by means of electronic platforms. However in case of such approach, UIS role is finally leveled. It will turn in a mere "show window" of information on purchases.

## Conclusions

To put basic conclusions of this article into a nutshell:

1. Low financial transparency of ETP. Today almost all Russian ETPs in public procurement market are closed for regulators and controllers in the main indicators of the financial activity. Only one platform – UETP – opens financial information on the work as a joint-stock company. Introduction of requirements to disclosure of information will allow to provide full control and audit of work of platforms.
2. Uniqueness of the Russian electronic trading system. The actual model of work of ETP in Russia is a public-private partnership when the state represented by the Government of the Russian Federation has actually delegated powers on holding electronic procedures of purchases to a limited number of commercial subjects. At the same time the world practice shows only two sustainable models of ETP participation in public procurement: state electronic trading platform or unrestricted market of ETP (purchasing body has a right to use any ETP that operates in the market). There is no examples found in other countries when an

ETP acts as recipients of tender security from bidders in government parket.

Uniqueness of the Russian electronic trading system consists, including, of:

- Introduction of the obligatory auction list of production and consideration of electronic auctions as anti-corruption measure
- The organizations of providing applications at electronic auctions in a financial form and creation of a pool of banks of beneficiaries from providing auction applications
- Creation of a limited pool of operators of the electronic trade procedures having monopoly access to government purchasing market

All these features form an environment where the Russian ETPs receive the unknown level of preferences and opportunities at a minimum level of expenses, requirements, and responsibility.

3. The considerable financial resources are withdrawn from economy. The current business model of ETP consists of placement of available funds in bank deposits. Platforms receive profit from an opportunity to use security means generated from tender security payments. It deprives many participants, especially representatives of small business, a possibility of participation in competitive procedures as often they aren't able to obtain the bank guarantee for participation in electronic procedures (National Report 2016).

## Synonyms

Organizational knowing: working practices; Practice; Public administration; Public sector

## Definition

"Knowing" in public organizations stresses "the contribution of human action, interaction, and socialization in defining new ways of dealing with policy problems and carrying out administrative tasks" (Agrifoglio et al. 2020).

## Introduction

Knowledge management (KM) research is rapidly increasing in importance in the public sector, but its application usually seems difficult, due to excessive bureaucracy, formalization, and hierarchy, which traditionally pervade these organizations (e.g., Boyne 2002; Willem and Buelens 2007; Saviano et al. 2018). Indeed, the characteristics of public sector organizations may limit the free exchange and sharing of information and knowledge (e.g., Liebowitz and Chen 2003). However, knowledge is seen as a key resource for public sector (Willem and Buelens 2007; Henttonen et al. 2016): these organizations face greater pressures for representativeness, accountability, responsiveness, openness, transparency, and participation than private sector (Massaro et al. 2015), with citizens expecting the same

standards of service from government compared with those from private organizations (Ali Al Ahbabi et al. 2019). For example, responsiveness implies for steadily collecting and integrating knowledge from diverse actors into new operational practices and policies, in order to improve service delivery (Richards and Duxbury 2015; Badinelli et al. 2012). Thus, improving KM is a critical challenge for public sector (Kim and Lee 2006), in order to increasing pressure to innovate in service delivery and improve performance (Pee and Kankanhalli 2016). According to Edge (2005, p. 45), KM "has the potential to influence greatly and improve the public sector renewal processes," and it is seen as an important tool for dealing with "wicked" public problems (Dawes et al. 2009; Di Nauta et al. 2015).

Nevertheless, KM literature is still limited in the public sector, with studies often fragmented and relatively few focused on empirical evidences (Massaro et al. 2015). Within KM research, some scholars have drawn attention to the contribution of human action and socialization processes to defining new ways of dealing with policy problems and carrying out administrative tasks through the concept of organizational knowing (e.g., Wagenaar 2004; Feldman et al. 2006). The focus on collaborative and socialization processes supports the conceptualization of knowledge as a collective knowledge, which is an entity emerging from the interaction between, rather than within, individuals (Alavi and Leidner 2001). In this regard, organizational knowledge could be defined as a "stock" of knowledge emerging from interaction between what people know (knowledge) and what people do (knowing) in organizational settings (e.g., Cook and Brown 1999; Agrifoglio 2015). Henttonen et al. (2016) observed that there is an increasing recognition of the role of individuals in KM processes, and in the public sector the KM tends to utilize more people-based approaches and focuses more on social interaction than KM in private companies (McAdam and Reid 2000; Canestrino et al. 2019).

The organizational knowing perspective allows deepening the phenomena of the KM within public sector, understanding how knowledge is generated and used in these organizations. Therefore, it becomes interesting to highlight the developments in the topic of organizational knowing within public organizations in the KM literature, offering a guide to scholars in identifying possible insights.

## Defining the Concept of Knowing

"Knowledge is a multifaceted concept with multilayered meanings" (Nonaka 1994, p. 15). In fact, knowledge represents a complex topic, because it is somehow abstract, and it is often difficult to define and quantify. In any organizational settings knowledge tends to be fuzzy in nature, and it is usually deeply and closely attached to the individuals who hold it (Davenport et al. 1998), thus this issue is challenging to define, measure, and manage.

More recent research looks at knowledge as a "dynamic human process of justifying personal beliefs as part of an aspiration for the truth" (Nonaka 1994, p. 15). Specifically, according to Nonaka (1994), knowledge has been conceived as the specific and justified belief of an individual that is able to increase his/her capacity to take effective action. Besides, knowledge management is the process that enables organizations to identify, capture, and effectively leverage collective knowledge in an organization (Von Krogh 1999). It has traditionally focused on sets of socially enacted "knowledge processes," such as knowledge creation (known as contraction or development), knowledge sharing (known as transfer, distribution, or dissemination), and knowledge preservation (known as storage and retrieval).

The KM literature on public sector usually addresses the knowledge creation and the knowledge sharing to improve organizational effectiveness. An interesting research stream has focused on the relationship between KM and organizational characteristics for optimizing knowledge-sharing processes (e.g., Liebowitz and Chen 2003). Particularly, some studies (e.g., Alvino et al. 2011; Binz-Scharf et al. 2012) showed that the professional networks and communities of practice can allow public managers access to

others' information, experiences and knowledge, supporting public organizations to improve their ability to react to uncertainty and to complex contexts (Aguiari and Nauta 2012; Barile et al. 2016; Dawes et al. 2009). Other scholars have introduced the concept of knowing into the KM debate in public sectors, stressing the contribution of interaction and of the connection between knowledge and action. This approach focused on knowing as a process acted by individuals and organizations, rather than a static definition of knowledge as a resource that organizations possess (Blackler 1995), linking knowledge to dynamic, collective activity, practice, and performance.

The concept of knowing dates back to Cook and Brown (1999), who proposed a dynamic framework for understanding the organizational knowledge. They distinguish knowledge (what we know) from knowing (what we do), as well as the interplay between them. Thus, knowledge is about what people known, while knowing is about relation, that is the "product" of interaction with the social and physical context at a given time (e.g., Cook and Brown 1999). While knowledge enables members to perform a practice, it is also constructed by practicing in a context of interaction, and practice in a context is a way to enable people to acquire knowledge (Gherardi 2000; Cook and Brown 1999; Orlikowski 2002; Nicolini et al. 2003).

The growing interest on this topic has also contributed to the development of an emerging research area about knowing and learning in organizational contexts, well-known as Practice-Based Studies (PBS) (e.g., Nicolini et al. 2003; Gherardi et al. 2007). This approach focuses on the working practices within the organization, emphasizing the "extent to which knowledge is embedded within and inseparable from work activities or practices" (Hislop 2013, p. 31). Therefore, the practice is view as the generative source of knowledge, and the knowledge as a practical that is more closely aligned to individuals' actual work practices and needs. In this way, knowing precedes knowledge, and thus considers the latter as a factor of organizational life acquired through forms of participation and continually reproduced in practice. The administrative work has been regarded as a practice within public organizations, highlighting the interaction between knowledge and actions (Wagenaar 2004); as well as policy issues have been understood as ways of knowing for providing to public managers a tool to inform practices in order to identify new ways of dealing with policy problems (Feldman et al. 2006).

## State of Art

What is the relevance of research on organizational knowing within public organizations?

In order to answer to this research question, the main results of Agrifoglio et al.'s (2020) contribution were reported in what follows. Authors conducted a systematic search of the literature for understanding the relevance of organizational knowing within public organizations. Particularly, using a systematic literature review, they collected data by two of the most relevant online academic databases, Scopus and WoS.

A first dataset composed of 296 results, of which 71 by Scopus and 225 by WoS, was then checked for removing duplicates and for identifying the irrelevant contributions. The final dataset, composed of 123 publications, of which 48 by Scopus and 75 by WoS, was then analyzed to obtain information on (i) publication trend and types of sources; (ii) citation trends over the years and on most cited sources (citation analysis); and (iii) citation network and the topic clusters by using SNA (co-citation analysis). These findings allowed to offer important considerations with regard the relevance of organizational knowing research within public administration literature.

First, with reference to the publication trend over the years, the number of publications ranges from 1 (1992) to 8 – 123 in total – (2019), with the main concentration during the period from 2009 (n = 9) to 2018 (n = 7).

With reference to the types of sources, instead, publications were drawn by academic journals (63%), conference proceedings – and working papers – (23%), and books – and book chapters – (14%).

Furthermore, the final dataset was performed by using a citation analysis, obtaining data about the citation trend over the years and the most active journals. Particularly, with reference to the citation trend over the years, the final dataset referred to a total of 2,376 publications, of which 1,133 by Scopus and 1,043 by WoS. The number of citations ranges from 0 (<1994) to 398 (2018), with a main concentration from 2008 onwards. With reference to the most active journals, findings have shown the relevance of the topic for academic journals that refer to Public Administration (for instance Public Administration n = 12), management (for instance Academy of Management Review n = 14), organization (for instance Organization Science n = 23), and Information Systems (for instance Government Information Quarterly n = 12) fields.

Finally, with reference to the co-citation analysis, findings have also shown the existence of a network of the 42 most cited sources which can be classified in two different topic clusters (cluster 1 n = 23; cluster 2 n = 19).

## Conclusion

This contribution addresses the innovative trend of organizational knowing in the public organizations, according to the broader knowledge management framework. In fact, according to Authors, this framework offers interesting new perspectives for scholars, managers, and policy makers, highlighting the importance of planning a new research agenda and stream on the subject.

Currently, the research topic is moving, even at different force. In fact, the stream is constantly increasing in numerosity since the first examined publications, particularly in the last 20 years. Nonetheless, it appears that the numerosity of publications and citations are not properly growing rapidly.

Among the reasons of this trend, probably the topic has been studied, deepened and discussed in different contexts and scenarios then the public sector, with a limited cross integration. Furthermore, this risks to fragment the discussions and critics, not favoring the growth of a proper international research community, and somehow extending the divergences at the conceptual level. On the contrary, according to the Authors, the topic would deserve further investigation in the near future by a consolidated network of research groups and institutions, also focusing on empirical evidences.

Coming back to the core of the study, two main clusters of research domains have been identified through the analysis, and each of them would deserve proper insights and cross integration and fertilization. A first cluster is related to a widespread normative and prescriptive approach addressed to support the implementation of technological innovations. A second cluster is addressed to the relevant role of processes and practice-based approaches to allow the understanding knowledge creation in organizations, often public ones.

The study suggests useful insights for scholars, managers, and policy makers. On a theoretical perspective, it offers a frame which depicts the organizational knowing topic diffusion. On a managerial one, the study offers a view on the most relevant research domains from which decision makers can get inspiration while dealing with organizational knowing issues in (public) organizations.

Even the results highlight interesting opportunities for future development for the analyzed research domains, and organizational knowing appears to deserve more studies, hopefully including empirical ones.

Of course, it should be noted that, as often happens with those studies that use citation analysis' technique to study research foundations, also this contribution has some limitations. A first is related to clustering process of the knowledge domains, currently not so much diffused in the literature. Another limitation is related to the list of the most relevant contributes, which could not include the older and/or the most recent publications. Besides, the most recent ones, even relevant for the debate on organizational knowing within public organizations, could suffer a low number of total links strength and citations. Older ones, even a significant for the debate, could be non-included in the Scopus database (going back to 1966) cause

not indexed. Another limitation could be represented by the choices made in the review analysis not including some synonymous and cross-concepts related to organizational knowing. If on one side it would have enlarged the dataset, on the other side it would have introduced a distortion.

Beyond these limitations, the study offers precious opportunity for those scholars interested in moving their research along the lines proposed. Somehow, it is a starting point for the ongoing debate – hopefully growing – within public organizations on the use of organizational knowing.

# Knowledge Management and Governance

Akram Hossain
Public Policy and Governance (PPG) Program, North South University, Dhaka, Bangladesh

## Synonyms

Extract; Managing information and experience; Use and share of knowledge

## Definition

Knowledge management (KM) is the key way to bring sustainable change in human behavior both in terms of functional and moral in order to smooth functioning of governance process for achieving organizational goals in an effective as well as efficient manner.

## Introduction

Knowledge management (KM) is an integral component of governance system in an organization. Knowledge although always remains as the most important resource both at individual and collective levels, recently organizational practitioners, private and public, reinvent the role of knowledge in management and governance, emphasize on it, and involve in knowledge management. Consequently knowledge management now constitutes a vital part of governance. Competitive work environment urges for performance maximization, information revolution, rapid changes in technology, and attitude of the citizen, and customers have created a compulsive situation for attaching serious attention to knowledge and knowledge management. Human society, as identified by Robinns, after surpassing two prior waves, agricultural and industrial, is now in the third wave, the information wave which is, being accelerated by cyber revolution, bringing changes rapidly in the inner and outer states of individual and collective worlds. Business sectors for obvious reasons first feel the necessity to harmonize with the changes and include cyber sector within its scope and begin to conduct knowledge management in the organization. Later public governance started practice of knowledge management in order to encounter complex and intricate task of modern age. Knowledge management essentially aims at improving knowledge base in the organization and includes a number of activities such as identifying, creating, storing, sharing, and applying knowledge in the functioning of organization. Different strategies have also been developed and are being used to conduct knowledge management process. These are found to play an effective role in ensuring better performance in terms of increased volume and quality production and outcome.

Most of the existing literatures, scholars, entrepreneurs, and government put full emphasis on knowledge management due to its importance in enhancing organizational capacity to innovate and to produce more and thereby ensure development and maximize profits. However, this paper argues in a distinct approach where knowledge

management is considered as the essential kit to bring sustainable change in human behavior in the organization which ultimately paves the way for smooth functioning of governance. The changed or positive attitude in organizational people or citizens will ease and support the way of ensuring governance principles and practices. So, the principal objective of this paper is to place the knowledge management as the supportive mechanism for governance both in private and public sectors.

## What Is Knowledge?

"The information, understanding and skills that you gain through education or experience: practical/medical/scientific knowledge OR the state of knowing about a particular fact or situation" (Oxford Advanced Learner's Dictionary 2015).

Knowledge is the basic input to human behavior, and the behavior, in turn, acts as power that enables human being in involving labor and productive process as well as establishing relationship with the internal selfhood and external world. It is very difficult to have any universal definition of knowledge due to its holistic and indivisible nature. Plato, Aristotle, Kant, Aquinas, Moore, Gettier, etc. contributed much to this discipline and unveiled different issues related to knowledge from different perspectives that develop different theories of knowledge within the broader spectrum of empiricism and rationalism. All of them uphold the fact that there is a close relationship between knowledge and human behavior. Related to two broader types of human behavior, normative and technical, knowledge may be divided into two types as normative knowledge and technical knowledge that act on all functional behavior of human being. Human being by nature upholds some norms and values that are shaped by his/her inner sense and environmental dynamics. Knowledge is the unique characteristic drawing distinct difference between mankind and other beings.

Normative/judgmental knowledge helps take judgmental decisions and draw divides between what ought to be done and what ought to be not, while the technical knowledge enhances technical proficiency and expertise. These two types of knowledge are inseparable and constitute the two sides of a single coin. One determines the end and the other makes the drive to attain the end. There are also five levels of knowledge, all of which are imperative for effective governance in an organization.

Figure 1 explains that functional or technical knowledge is the lowest tier, while the spiritual knowledge is the highest. The contemporary knowledge management still focuses mostly at the bottom level of knowledge, i.e., functional or technical expertise and to a certain extent managerial tactics and very limited extent to policy-making strategies. Religious and spiritual knowledge remain almost out of the domain of modern KM framework. Thus, only experts are being produced, and therefore policy-making processes are not dictated with wisdom. Even religious knowledge has become part of technical aspects of learning. Majority of people can read their religious books but cannot understand the

**Knowledge Management and Governance, Fig. 1** Levels of knowledge

meanings and significance. One may be an expert in religious books and traditions, but he/she is not committed to that knowledge and not ready to follow those in real life. For example, there is a traditional belief in Islam that reading translations of Quran (the holy book of Islam) are to "not count" because it is not in Arabic language, and therefore many Muslims do not understand Islam and remain Muslims only by name like a brand without following it in daily life. So a complete definition of knowledge should cover a holistic perspective from functional to spiritual level that can influence human behavior to a sustainable and desirable change. And such comprehensive knowledge can contribute in effective functioning of governance process.

## What Is Knowledge Management?

KM is not only the managing known knowledge, but it also encompasses the process of creating and employing new knowledge. At the same time, it helps organizations acquire the required knowledge to perform better. The communities and society, in which the organizations function, persistently pursue knowledge and build a better understanding of business, industries, economy, and society. Such knowledge helps organizations make the strategic decisions to remain relevant and sustainable into the future (Macnamara and Ash 2010).

Knowledge management is the way of controlling and dealing with organizational knowledge and experiences in order to produce desired benefits. Knowledge management is capturing, creating, distilling, sharing, and using know-how of both explicit and tacit knowledge (Hess 2006; Uriarte 2008; IFAD 2007). KM is not about the wisdom and best practices; rather it is about sharing and utilization of knowledge (Collison and Parcell cited in IFAD 2007). Modern business organizations strongly felt that knowledge is one of the most important assets which has to be shared among the management and subordinate staff, and thus the organization will grow stronger and become more competitive (Uriarte 2008). The goals of KM are the leveraging and improvement of the organization's knowledge assets to effectuate better knowledge practices, improved organizational behaviors, better decisions, and improved organizational performance (King n.d.)

Uriarte (2008) explained KM as information management and people management. Information management is related to the management of required information applying proper tools or methods in order to turn it into useful knowledge for organization. People management, on the contrary, includes motivating and controlling of people in the organization to ensure that its knowledge-related assets are improved and effectively employed (King 2008, cited in King n.d.). Knowledge management also works to capture diversified knowledge, identify best practices in different parts of the world, and exploit those toward innovation to attain desirable growth (Zaragoza-Saez et al. 2009; Bartlett et al. 2004).

It is evident that most of the KM scholars viewed knowledge management as a process of only functional efficiency. But knowledge management, like knowledge, is a holistic system of managing knowledge with a view to enhancing effective and efficient behavior in the organization for maximizing output and outcome. This paper considers knowledge management in a holistic perspective where balance importance is provided to both functional and normative knowledge of human resources. Imparting only technical know-how can be useful to enhance organizational expertise, develop innovative ideas, and increase production and growth level, but for a sustainable and desirable change in behavior, normative aspects of knowledge have to be taken into consideration.

## Knowledge Management and Governance

The way of steering or directing societies and organizations is governance. The World Bank defined governance as the "exercise of authority, control, management, power of government." In other words, governance is "the manner in which power is exercised in the management of a

country's economic and social resources for its development" (WB 1991). Governance can be referred as the processes of control or regulation within organizations and implementation of authority to ensure service delivery in an authorized and regulated manner (Weill and Woodham 2002). In the *Oxford Advanced Learner's Dictionary* (2015), the word governance is defined as "The activity of governing a country or controlling a company or an organization; the way in which a country is governed or a company or institution is controlled."

Governing a country or controlling an organization is not an easy task. It has multidimensional aspects, and a number of stakeholders are to be taken into consideration for efficient and effective functioning. An individual or group of people cannot be controlled with only a set of rules, regulations, and applying other coercive methods. There may have established laws to regulate acts of citizens but to force those laws government cannot appoint an inspector for all in everywhere; rather it requires willingness and acceptance of people regarding the rules to be imposed (Sawhill 2015). People need moral support and inner boost ups to be self-motivated and act in an expected manner. Knowledge management strategies with holistic approach can play a significant role in molding human behavior toward desirable direction.

Nowadays, both public and private organizations are suffering from not the lack of efficiency among the employees or citizens but from the absence of ethical standard, moral behavior, and positive attitudes as well as willingness to work sincerely. Technical expertise can be developed over time with doing things in practice. An illiterate man may be transformed to an expert computer engineer, but for the positive use of the computer, he needs moral support and guidelines. Every organization is busy with growing technical expertise among its employees and avoids, knowingly or due to the ignorance, normative aspect of life. Thus, an efficient employee becomes an expert in corruption as well. In such circumstances, governance is helpless and ineffective. Proper knowledge management strategies incorporating both functional and normative dimensions can be a sustainable solution in such a critical situation.

The extensive growth of globalization due to the overflow of information technology has created a compulsive situation within organizations regardless of public or private for new products, better services, and innovative ideas. Consequently, organizations are compelled to assess what they know, what they do not know, and what they should know (Prusak 2001). Having comprehensive level of modernization in information and communication technology, access to information has become wider, and anyone can get its access at any time from any place. In such circumstances, governance process has to be accomplished in a more effective manner to ensure smooth service delivery. Therefore, governance system needs to apply new and innovative strategies equipped with effective knowledge management processes and practices.

Knowledge is necessary for effective and efficient human behavior to achieve targets or goals at individual and collective level within dynamics of environmental supra system. There are basically two types of behavior we execute; one is judgmental and another is technical behavior. The both kinds of behavior are closely interrelated, interdependent, and inseparable. From this backdrop human being requires two different branches of knowledge – judgmental and technical. In performing any activities, we always face two questions either in a mental or physical level: should we perform the job? and how do we accomplish the job? The former is related to judgmental behavior, and the latter one is technical aspect of behavior. Knowledge management, necessarily, encompasses the very two kinds of knowledge: normative and functional knowledge as its basic inputs.

Governance is nowadays the indispensable issue not only in developing countries but for developed nations as well. Many propositions, initiatives, theories, and models have been developed to ensure better governance in organization and state level in all over the world. A number of relevant forces such as donor agency, international organizations, advanced countries, etc. are also found very much vocal and highly interested

in regard to the governance system in developing countries. They have set indicators of good governance and persistently put pressure to achieve the standard. Some of the indicators are people's participation, rule of law, transparency, responsiveness, consensus orientation, equity and inclusiveness, effectiveness, efficiency, and accountability. All these indicators are in one or other way related to both the functional and normative behavior of individual. But the current education system and knowledge management are focusing merely on functional or technical aspects of life, how to increase efficiency, expertise, and level of production. Normative aspects are ignored and got little attention. The reality is extreme in business sector where the major aim is to reach the highest level of performance and productivity having profit as the prime focus. Better management is measured here mainly by two indicators of good governance, efficiency and effectiveness, while the other indicators get less emphasized or overlooked.

It is always a prime concern of how to ensure the indicators of governance in functional or technical point of view and thereby initiate a number of rules and regulation, impose several obligations and responsibilities, and many other technical measures. With these initiatives, it is expected to produce positive impact on the indicators. Thus, the technical dimensions are overemphasized, while human dimensions are ignored or forgot. But in order to ensure better functioning of governance, people should be intrinsically motivated and encouraged to be cooperative toward governance process. Proper knowledge management having both technical and human aspects can create a congenial environment for the effective functioning and development of governance.

## KM and Public Governance

The contemporary knowledge management strategies and approaches are mostly concerned with how to make organizational knowledge more productive, how to produce benefits for the organizations, and what ways to gain competitive advantages in the free market economy of the modern globalized world. Moreover, the main focus of such KM is on the increasing technical efficiency for maximizing production particularly in private sector organizations. Public sectors are mostly ignored and do not get proper importance in the discourse of KM. The management styles and objectives are quite different in private sectors where authoritarian rules and regulation, reward and punishment, strict assessment of performance, etc. are the key measures to manage employees and customers. But, on the other hand, public organizations and governance are totally different and more complicated to manage in comparison with the private sector. The nature of problems in public sectors with regard to honesty, integrity, transparency, accountability, corruption, and so on is completely different. So ethical or normative aspects of KM might be much more required in public governance than in private sector management. Only strict approaches, like private sectors, cannot overcome many vital problems in public organizations. There is a need of strict and carrot approach together to solve the problems. The KM with ethical and normative dimensions and practices can be one of the best ways to effectively handle the modern crisis of public governance.

Animosity and spirituality are the duality of human nature where animal part concerns with only material world, and divine part includes morality, values, and ethical aspect of life (Koehn 2003). In order to combat animosity and worshiping of material god, ethical knowledge can be imparted into the human. Since, the nature of human is of two parts, they are biologically in need of two kinds of food: material knowledge and ethical or divine knowledge. There is direct relationship between these two types of knowledge and human behavior. If human beings are introduced only with one domain of knowledge, the other part will remain dark resulting contradiction in the pattern of behavior. As an obvious outcome, an individual, being highly educated or expert in functional knowledge, may not be able to right decision in an ethical point of view. At the same time, another individual having great ethical standard may be dictated toward socially unaccepted actions due to have strong feelings of

deprivation and disgraceful life of without adequate functional knowledge or excellence. Unfortunately, the current discourses of KM are facing this crisis of nurturing partial knowledge.

In most of the cases, scholars are found reluctant about the ethical and moral aspects of human life, while they are quite serious in better performance of governance. However, a few academics discussed about this neglected areas of KM. Rene and Engelen (2006) talked about social capital theory. They defined social capital as the resources like trust, belief, rules, norms, etc. They argued that KM has an important role to play in the development of social capital at different levels such as cities, communities, organizations, nations, etc. In many cases, managers of an organization inevitably involve in corrupt and unethical works where the personal value system is "squeezed out" due to the extreme workloads and difficult business targets (Bartlett 2003). Wiig (2007) emphasized on practical knowledge and the commitment to the knowledge for ensuring good governance. He also argued that knowledge can ensure effective participation of citizens in public affairs.

Historically, due to extensive pressure of market, public sectors are found to borrow private sector concepts and practices either without any change or with some modifications. KM is one of the best examples, among others, like total quality management (TQM), performance management, strategic management, change management, etc. But the problem occurs when the private sector models are adopted in public organizations without considering the difference in nature of business. Private sector and other non-governmental organizations do not have any comprehensive role like public governance. The role of public sector governance comprises both normative and functional dimensions. KM too in public governance equally encompasses the two broader types of knowledge. On the other hand, functional or technical knowledge mainly constitute the locus and focus of private sector KM.

Knowledge and learning process in the modern private sector thus influence only the functional behavior of the employees in order to achieve technical efficiency for better performance and better output in terms of products or goods only.

Figure 2 clearly indicates that in private business organizations, KM process produces partial learning that influences only technical or functional expertise ensuing output maximization. But governance in public sector is based on a holistic approach. It requires equal importance on all the indicators of good governance in order to achieve desired outputs. Even functional or technical efficiency is a less important component here compared with the normative or ethical knowledge and commitment. Essentially, public governance is all inclusive in nature, and it has to deal with a highly complex social, political, economic, and cultural setup where an organization functions. So KM strategies have to focus here both functional and normative aspect of human behavior. In this situation, a KM framework for effective public governance needs to be developed which will put more importance on molding normative behavior of individual rather than focusing merely on functional expertise. Governance process influences behavior of its stakeholders to achieve its objectives, and at the same time, governance itself is influenced by the behavior of its stakeholders. Whether the governance is good or bad, the ultimate analysis is based on the pattern of this behavioral relationship. The stakeholder theory of governance has been developed on this notion of serving mutual interests of the organization's owners or shareholders, investors, employees, and the societies or external environment (Berghe 1999). Since the behavior of all these multilevel stakeholders is the product of knowledge, eventually, KM plays a vital role in functioning of governance.

**Knowledge Management and Governance, Fig. 2** KM in modern and business perspective

The diagram (Fig. 3) shows knowledge in a holistic perspective where both normative and functional behavior are influenced by the KM process. It also displays how environmental factors have a linkage with the output mechanism. Public organizations are to function along with multidimensional stakeholders, pressure groups, business organizations, and many other actors who directly or indirectly influence the performance of governance process. So, all these external factors have to bring into consideration for a public governance system while taking any initiatives and interventions. Extensive KM strategy is a must for managing such complicated environment of functioning. Moreover, the major crisis of governance is related to unethical behavior in decision-making process as well as mismanagement or corrupt practices in the implementation stage. Therefore, KM process should focus on the holistic learning that can ensure positive changes in human behavior in terms of both normative and functional point of view. Thereby different and complicated aspect of public governance including external actors and factors can be managed in a more successful way.

## KM and Governance in Classical Perspective

Many classical literatures and thinkers including Kautilya talked about the importance of knowledge management in governance as a holistic perspective. Every citizen should have functional as well as normative knowledge to be conscious and responsible for better governance. The four sciences of Kautilya can contribute to a great extent to overcome the present catastrophe in public governance system. The ideologies of Kautilya regarding state, statecraft, and ethics are still very realistic and effectively applicable in the current context of governance (Chandrasekaran 2006). The governments of developing and even developed countries are trying to achieve mostly the efficiency and effectiveness in running an administration with a perceived vision to attain economic development. Normative aspects of governance are narrowly focused or completely ignored in contemporary public affairs. Kautilya in his Arthashastra emphasized more on Anvikshiki, the highest level of integrity and triple Vedas, the religiosity for a king to govern his state. He also provided a detailed description of the roles and responsibilities for different segments of people in the society which are very much pertinent in ensuring proper balance and division of work. He focused mainly on the king who can only ensure welfare for the people through maintaining good administration. Sharma and Sharma (cited in Haque 2013) have identified ten indicators of good governance from Kautilya's Arthashastra which are mostly focus on king and related to ethics, morality, and other normative aspects of human life.

**Knowledge Management and Governance, Fig. 3** KM in public governance perspective

Kautilya's four types of knowledge, "Anvikshiki," "Trayi" or triple Vedas, "Vartta," and "Dandaniti," correspond to normative knowledge, legal knowledge or code of conduct, and occupational, technical, or expert knowledge in modern time. Kautilya suggested being self-disciplined and to be aware of "six enemies" which he defined as the six organs of sense like lust, anger, greed, vanity, haughtiness, and over-joy. The bad qualities of human being identified by Kautilya as six enemies generate corruption, exploitation, and other vices in the governance system and in the society. Anvikshiki is the science or special knowledge to defeat these enemies and ensure sound governance both in individual and collective levels (Kautilya's Arthashastra 1915). In the modern age, visible outputs and material gains are getting much importance

and thereby values, norms, and many other ethical and moral grounds of human life lag behind. Therefore, good governance cannot be achieved although having much cry for it. Kautilya's approach of knowledge management can play a great role in constructing and promoting ethical and moral foundation and in maintaining a proper balance between normative and material aspects of life. In such a process, the crisis of governance will overcome, and appropriate knowledge-based governance system can be established.

## Conclusion

The success of governance depends on the process of knowledge management at the individual level to social level to state level. Proper knowledge management framework with required importance toward functional as well as normative aspects of human behavior is indispensable to overcome the contemporary challenges of governance in all over the world. Knowledge is to be exercised with an aim to attain excellence at all level of human life from functional expertise to spiritual height. A complete knowledge management approach includes the learning process that creates a human being with positive attitudes, expected behavior, loyal to rules and regulations, and at the same time experts in functional know-how. Governance can reach its highest level of efficiency and effectiveness where the KM framework is in place to mold human behavior toward the right direction.

## Knowledge Management in the Public Sector

Mohammad Hassanzadeh
Knowledge and Information Science Department, Tarbiat Modares University, Tehran, Iran

### Introduction

Knowledge management (KM) in the public sector encompasses unique features (Asian Productivity Organization 2013, P. 17) which are commonly rooted in the relationship between citizens and governments. Through mutual interaction, citizens and the government interact for the institutionalization of the rule of law, national security, international credibility, public welfare, public health, inclusive vitality, lifelong education for all, and advanced scientific, cultural, and social infrastructure. However, in the private sector, other factors such as market share, profit, cost-benefit, and market formulas play more important roles than the mutual interaction between the citizens and the private sector. Despite the existence of common features between the two sectors there are still certain discrepancies in the nature of citizens' interactions with the two sectors.

From the KM perspective, the public sector holds exclusive dimensions, which inspires the coordinates of KM in the public sector. Some specific features of the public sector are as follows:

1. Government agencies are established, whether by selection or by appointment, to provide services to the public.
2. The fate of citizens and the government are largely interdependent.
3. The reinforcement of laws and regulations by the government and citizens depends on their mutual cooperation and commitment.
4. Major national challenges such as poverty eradication, justice, transparency, education, security, etc. require multilateral collaboration between the people and the government.
5. Adoption of new developments requires agility of the government and the support of citizens.
6. Return on investment in the government organizations is characterized by factors such as the growth in development indicators at the national level, the governments' credibility in international scales, improvement in the living standards of citizens, and so on.
7. The knowledge and experience gained from the successes and failures of government agencies ultimately provide a platform for reforming the overall governance system.

### KM Definition and Rationality

KM is a concept that has been defined variously by researchers and practitioners from different disciplines. However, there are concepts upon which definitions mainly focus: KM is a process, knowledge is tacit and explicit (Nonaka 1991), and knowledge is to be applied. To put it in other way, KM is a continuous process of perception/acquisition, audit/organization, dissemination/development, and application/creation of knowledge with the aim of achieving expected goals and defining new developments (Hassanzadeh 2013) (Fig. 1).

Thus, KM is seen as the process of helping individuals and organizations identify, elicit, organize, and disseminate vital information and

**Knowledge Management in the Public Sector, Fig. 1** Knowledge management process

talent that are considered as organizational memory (Stein 1995), even though they may subsist in an unorganized composition. KM enables managers to facilitate organizational learning, strategic planning, and dynamic decision-making with an improved efficacy and effectiveness. By acquiring and implementing the required knowledge, organizations will be able to transform into actual learning organizations (King and ko 2001).

The rationality and legitimacy behind KM involve constant changes in societies and organizations. A chain of events and developments such as the evolving and everchanging expectations of citizens, and communication complexities resulted from the growing connectivity of citizens and organizations require the governments to leverage the knowledge to address the needs. Increasingly the knowledge is seen as a main facilitator toward building a promising future and this accelerates the necessity of structural and content adjustments in line with the public will. This means that KM in the public sector coincides with public policymaking processes and this again emphasizes the necessity of synchronicity between the public policy formulation and the public KM. Although a significant fragment of the knowledge required by the public sector is obtainable through public involvement, research, and development to create scientific knowledge to deal with unpredicted events and situations are indispensable. Establishing supportive procedures for KM in the terms of strategies, incentives, budgetary, instruments, communications, and involvements admits the government to enjoy the benefits of KM in sake of public prosperity. Governments are increasingly confronted with numerous unrequited questions that lead them toward efficient knowledge and effective KM. Effective interaction with stakeholders, counterparts, and meeting the needs of macrolevel issues like sustainable development goals hasten the endeavor to manage knowledge in the public sector.

## Objectives of KM in the Public Sector

Managing the knowledge assets, most of which reside in the minds of employees, clients, managers, and experts, is a complex process

(Raudeliūnienė et al. 2018) with interconnected targets. Managers indenting to establish KM in their organizations strive to achieve several main objectives such as the following:

1. To become an intelligent and knowledge-based organization.
2. To accelerate the process of knowledge creation and dissemination.
3. To secure social support to offer and endure new services.
4. To enhance the flexibility of the organization's business processes for rapid response to environmental requirements and social crises (i.e., Covid-19).
5. To identify the resources and formulate strategies for knowledge development.
6. To enrich explicit knowledge and conversion of tacit knowledge into explicit knowledge.
7. To prepare infrastructure for knowledge sharing and turning it into core competencies of the staff member.
8. To craft a dynamic and extensive system to scan, identify, and document ongoing knowledge and experiences of projects and special missions.
9. To encourage the human resources to learn from successes and failures.
10. To improve the capabilities and proficiencies of employees by reassuring individual and organizational learning.
11. To develop a framework for value creation from intellectual assets and sharing it with the public.
12. To improve a supportive culture of cooperation in creating value from past experiences.

## The Main Elements of KM in the Public Sector

Considering the multifaceted nature of the public sector and instabilities of the approaches and policies upon which this sector relies, KM in the public sector encompasses elements that are far broader, more diverse, and extremely complex. Traditionally, KM has been identified with the three main pillars of technology, culture, and people. Technology as a facilitator of processing, storage, dissemination, and communication; supportive culture as an indicator of organizational solidarity to create an atmosphere of cooperation on KM programs and to create a sense of participation and commitment to knowledge sharing; and people as the main driver of all KM activities.

In addition to these three factors, which usually are common with the private sector, there are three other pillars which play an important role in the public sector: power, politics, and bureaucracy. Power is an integral part of the governance. Governments often seek to consolidate their power and leverage it to achieve their targeted objectives. The alignment of knowledge and power defines a multifunctional combination for KM in the public sector. There is a significant relationship between the governments' attitudes and views on the power and function of knowledge. Throughout history as well as in the contemporary era, there are many instances of the interaction between the power and the knowledge. The use of knowledge in order to consolidate power or employing power to facilitate the creation and dissemination of knowledge is common and precedential.

Politics is defined as a factor for the administration and enabling the interaction among various actors and parties in social environments. Regarding the relationship between the politics and the use of knowledge, governments often use power factors such as the media, persuasion, party assemblies, propaganda, and so on to justify their achievements among the public. Sometimes, the heavy impact of political equations on society makes it impossible to transfer knowledge from one administration to another. On the other hand, sometimes political affiliations and mutual interests between individuals and governments have contributed to knowledge dissemination. This reemphasizes the exceptionality of KM in the public sector.

In addition to the two aforementioned factors, bureaucracy as an instrument of governance establishments also plays a significant role in the KM in private sector. The issues related to structure of communication, flow of information, access and use of data, manner in which

knowledge is acquired and applied by the public sector employees, and the interaction with citizens encompass the features of a bureaucratic order. This order, however, varies from state to state and even from an administration to another. But depending on the type of governance approach and the structure of public participation and interaction as well as the behavior of the bureaucratic system, requirements, and prerequisites of KM also vary. The central notion is that the bureaucracy plays a significant role in KM in the public sector.

## Knowledge Resources in the Public Sector

Knowledge is generally classified into implicit and explicit based on an ontological classification. In an epistemological classification, it is classified into individual and collective. The objectivity or subjectivity of knowledge refers to its observability and accessibility in the form of physical artifacts or its concealment in the minds of individuals. Explicit knowledge is usually apparent and organized in the form of documents. But tacit knowledge is put as talent of human resources, and it is impossible to be aware of it until it is represented in the form of actions, lectures, suggestions, training, and so on. Collective knowledge is the knowledge that is shared.

Actionable knowledge in public sector initiates from different stakeholders and this is one of the main and determining features of KM in this sector. The following is a concise list of knowledge holders:

- Managers and employees.
- Government-related brokers.
- Enacted laws and regulations.
- Structure of government organizations.
- Defined and running services.
- Organizational communication and government vision.
- Consultants and service providers.
- Citizens.
- NGO.
- Private sector organizations.
- International institutions and regional coalitions.
- Databases and knowledge networks.

Every initiative related to KM and subsequent value creation in the public sector requires to connect this wide range of knowledge holders. A holistic view of this wide range of stakeholders is a prerequisite for better understanding of KM system dynamics. As citizens' satisfaction and productivity are viewed as the main drivers of KM in public sector (Siami-Namini 2018), an effective communication among working elements and knowledge resources will improve the sense of public participation and collective wisdom. The change of administration and the resulting transformation in government departments and institutions are among the major challenges for KM in the public sector. Although the constituent elements of KM remain largely unchanged, alterations in the policies, approaches, and orientations of working administration impose changes on KM policy and actions.

## Characteristics of Knowledge in the Public Sector

According to the variety of resources and carriers, knowledge in public sector, in general, preserves specific characteristics which necessitate a customized framework for KM in public sector. The following features comprise the larger parts of such framework:

**Exclusiveness** Everyone in the public sector acquires knowledge based on a combination of the personal perception and enacted regulation which has its roots in public wills. This imposes an integration of different views, approaches, and functions to organizational environments. In addition, organizational knowledge is formed based on the historical governance traditions and the accumulated experiences and skills of the organization itself. Thus, each organization has its own characteristics and convention which provide an operational framework with exclusive set of knowledge and insights.

**Public Added Value** Organizational knowledge of public agencies improves products, processes, technologies, and services and enables them to increase their productivity (Riege and Lindsay 2006). Moreover, considering the public nature of the organizations, they are to suggest public added value. Especially in the age of digital transformation, the pace of change is very high and it is necessary for public to be able to use it in the right way to facilitate their operations and services.

**Irreplaceable** As a general understanding, knowledge created in one organization requires a customization process to be utilized in other organizations, because the same functions, experiences, and individuals may not be replicated exactly in other settings. Although it is a predominant perception that most public organizations are providing similar services and have similar knowledge requirements, in principle, the organizational culture, typology of services, contexts of services, and experiences gained in each organization are quite different. This makes each knowledge and experience gained in the organizations totally exclusive based on the new development and challenges.

**Strategic Role** Organizational knowledge is a strategic resource, so public establishments who intend to competitive survival and maintaining their dynamism have to establish appropriate appliances to capture relevant knowledge and translate it accurately into action, consistently, concisely, and in a timely manner to all individuals. They require attuning the strategic approaches toward public knowledge assets to deploy along with the organization's sustainable development goals.

## Knowledge Flow in the Public Sector

Knowledge is definitively known as a fluid mix of information, data, experiences, believes, and intellectual assets of an entity. In addition to the dynamic nature of knowledge, the performance of KM also depends to a large extent on the constant flow of knowledge between different sources. The flow of knowledge within public organizations and from the government to society and vice versa plays a decisive role in flourishment of knowledge and insightful actions. Knowledge flow within public agencies is operated both vertically and horizontally based on agendas, structure, and missions. Events such as knowledge exchange sessions and collaborative tasks are held alongside managing routine or even unprecedented affairs. The flow of knowledge from the society to public agencies occurs in the form of formal communications, feedback systems, informal structures, and public involvements. However, the potency of knowledge flow varies according to various factors such as clarity of procedures, the structure of governments, public engagement, and availability of technological facilities.

Smoothing the flow of knowledge within and between public organizations and toward the society is an important part of KM in the public sector. An accelerated flow of knowledge within and between administrations and in interaction with citizens is necessary for mutual empowerment (Hasani and Sheikhesmaeili 2016).

Fluidity of knowledge and experience is a function of knowledge transfer structures, level of transparency, and existence of a KM unit. The development of technical tools such as ontologies, portals, knowledge networks, and other dissemination instruments and procedures improves the accuracy and speed of the flow. Public organizations which integrate the knowledge flow into their core policy system are likely to gain more insights from the public.

Some critical factors that are related to success of knowledge flow in the public sector are:

- Technical infrastructure such as ontologies and knowledge networks.
- Expert human resources to conduct the flow.
- Analytical and knowledge extraction tools such as text mining, data mining, and so on.
- Motivation and incentives.
- Appropriate communication and advocacy.
- Mutual trust and reliance.
- Attitude of government authorities toward knowledge sharing.

- Improved formal and informal communication channels.

The flow of knowledge is among essential accelerators of KM and interoperability of public organizations and their responsiveness and journey toward good governance.

## Concluding Remarks

In public organizations, due to their wide and continuous relationships with the society from different strata, a good body of knowledge and experience is created. On the other hand, due to the dependence of public sector organizations on the governance formula, political changes, and developments in the mobility of human resources in different parts of government organizations, the outflow of knowledge is at a high level. Government agencies face constant demands for social change, public welfare, clarity, justice, and so on. Empowering public organizations to meet the increasing expectations is essential. New developments such as data-driven management, digital transformation (OECD 2019), and increasing connectivity require effective KM policy and practice in the public sector. KM is increasingly considered as a significant platform to improve the readiness of organizations to face these challenges.

Knowledge is an umbrella term to cover facts, information, and principles that are created and applied by humans but emergence of artificial intelligent applications has introduced new agents of knowledge creation and communication. Incorporating emerging technologies in public organizations' knowledge management processes seems necessary. Developments on cognitive science and other disciplines which are related to knowledge and human-information interaction provide an appropriate opportunity for knowledge extraction and sharing.

Knowledge domain of public organizations are vast and multifunctional. Diversity of domains and stakeholders, and density of unprecedented multifaceted events in public sector avoid a concentrated KM system which works well in private sector. Core knowledge as the significant part of KM activities in public sector often is located in distributed sources and diverse carriers. Being extremely paradoxical, the problematic part of the KM initiatives in the public castor is that management of core knowledge must be carried out within the organization while the major part of the knowledge is in the minds of citizens and organizational stakeholders.

Through building and continuous development of KM capabilities among citizens and establishing an advanced system for knowledge acquisition and dissemination public organizations will be enabled to deal with dispersed sources of knowledge throughout the countries. KM capabilities in the public sector encompasses a wide range of enabling programs. The focal notion of capability building for KM is to improve attitude, knowledge, and behavior of citizens and staff members to share, access, and use of knowledge for higher productivity and mass satisfaction.

Turning KM capabilities into competence and leveraging them to knowledge-oriented cooperation would be the main element of knowledge policies in public organizations. Although due to formal procedures and enacted law and regulations it is assumed that the significant proportion of the knowledge in the public organizations is explicit, the most important part of the core knowledge and empowerment still remains tacit. The staff members' tendency to share this implicit knowledge is greatly influenced by management philosophy and approaches to identify, acquire, and integrate knowledge into action. Knowledge to action framework by Graham and colleagues articulates this process (Graham et al. 2006).

These approaches are often translated into motivation and compensation systems and organizational procedures for evaluating the performance of individuals and even corporations (López-Nicolás et al. 2011). While being effective, these procedures must be integrated into public policy formulation processes. Improving the public commitment in higher levels of governance including policy and strategic levels provide public organizations with an opportunity to access the collective wisdom disseminated through public engagement.

Digital transformation as a result of enormous advances in information and communication technology suggests an improved application of digital carriers to public knowledge management (PKM). PKM as an actionable concept fosters theoretical and practical cooperation among multiple disciplines including public management, information science and knowledge management, and related fields of study which ultimately are to improve the implementation of effective knowledge management in the public sector.

## Synonyms

Employee motivation; Explicit knowledge; Knowledge application; Knowledge creation; Knowledge management; Knowledge sharing; Tacit knowledge

## Definition

- Knowledge in the workplace is commonly referred to as the know-whats, know-hows, and know-whys for performing tasks (Brown and Duguid 1998; Kogut and Zander 1992).
- A knowledge management system refers to "a systemic and organizationally specified process for acquiring, organizing, and communicating both tacit and explicit knowledge of employees so that other employees may make use of it to be more effective and productive in their work" (Alavi and Leidner 1999, p. 6).
- Knowledge mobilization refers to the dissemination of knowledge from the source of acquisition or creation to the rest of the organization.
- Causal ambiguity is defined as the basic ambiguity arising from the nature of the causal connections between actions and results (Lippman and Rumelt 1982).
- Explicit knowledge refers to knowledge that can be easily codified, explained, and thus

K

transferred from the knowledge source to other recipients/learners.
- Tacit knowledge refers to knowledge that cannot be codified, is highly abstract in nature, and the knowledge source usually knows more than she/he can tell (n).

## Introduction

Knowledge in the workplace is commonly referred to as the know-whats, know-hows, and know-whys for performing tasks (Brown and Duguid 1998; Kogut and Zander 1992). Knowledge may reside in individuals as intellectual capital or tacit skills, or embed in organizations in the form of organizational routines or standardized practices. In recent decades, knowledge management (KM) has come to be a "model answer" for organizations to manage business uncertainties. A KM system generally refers to "a systemic and organizationally specified process for acquiring, organizing, and communicating both tacit and explicit knowledge of employees so that other employees may make use of it to be more effective and productive in their work" (Alavi and Leidner 1999, p. 6). The core purpose of implementing a KM system, on top of its claimed functions of facilitating workers' acquisition, sharing, and integration of knowledge, is the transformation from individual proprietary knowledge to organizational knowledge asset for widespread utilization. Such a deindividualization process makes workers more replaceable.

The aim of allowing widespread utilization of organizational knowledge assets is never easy given the ambiguous nature of knowledge, complexities of human considerations, and all kinds of managerial and organizational constraints. This chapter will discuss some of the major issues in utilizing knowledge in organizations and highlighting the current state of research and its shortcomings. We will first discuss the importance and difficulties of knowledge utilization in organizations. Next, a specific section will be devoted to discuss the ambiguous nature of knowledge per se, which significantly inhibits knowledge's mobilization and utilization. Three important perspectives that characterize academic research and managers' attention on knowledge management will then be critically elaborated. They include the information communication technology (ICT) perspective, the human perspective, and the managerial perspective. The chapter ends with some concluding remarks to offer new and practical directions in studying knowledge utilization in organizations.

## Utilization of Knowledge Assets

Organizations accumulate knowledge (toward the market, their customers, production processes, innovations, etc.) throughout prolonged periods of operation. This knowledge base represents a core production factor and probably a source of competitive advantage to the organization. It is an important asset to be managed and utilized just as traditional types of assets like land, machinery, or human resources. However, utilization of knowledge assets differs, in some important aspects, from other organizational assets. For example, value of knowledge assets is unknown or undetermined unless it is being put into use to generate performance or output after being acquired or created by the organization. Moreover, ownership of knowledge assets is often ambiguous (except for patented intellectual properties), albeit perceived as being currently "owned" and managed by the organization. Organizations not only guard against external competitors on knowledge leakage but also negotiate internally with employees on the allocation of rents generated from the intellectual contribution of employees.

Careful but efficient utilization of knowledge in organization is thus no easier than its acquisition or creation at the outset. Two major difficulties may arise when attempting to optimize the economies of scale of knowledge assets: (1) having knowledge mobilized within the organization and (2) having organizational members apply the received knowledge. These difficulties can be further analyzed by three different but related perspectives: (a) an information communication technology (ICT) perspective, (b) a human

(employee) perspective, and (c) an organizational (managerial) perspective.

## Knowledge Mobilization in Organizations

Knowledge mobilization refers to the dissemination of knowledge from the source of acquisition or creation to the rest of the organization. It is mainly achieved by electronic transmission of documents via ICTs and/or teaching and learning between organizational members. However, transfer of knowledge, mostly in the form of best practices within organization, is often "sticky" (Szulanski 1996). Reasons for the stickiness of knowledge transfer include the causally ambiguous nature of knowledge per se, plus a variety of human factors including lack of absorptive capacity of the recipient, arduous relationship between the source and the recipient, and lack of motivation by the recipient (Szulanski 1996; Van Wijk et al. 2008).

Many managers approach the issue of knowledge mobilization from an ICT perspective. They believe that in general the management of knowledge assets is largely a technical problem – establishing a sophisticated ICT network that connects different parties internally and externally would be the panacea of KM issues. The use of ICT is especially suitable when the knowledge involved can be easily codified and taught, i.e., more explicit in knowledge nature (Zander and Kogut 1995). Commentaries and research findings suggest that the mere presence of ICT networks is insufficient to achieve effective knowledge utilization as the transfer process involves human actors. For example, Kankanhalli et al. (2005) found that in addition to the setting up of electronic knowledge repository (EKR), organizational reward, knowledge self-efficacy, and the expectation of reciprocity significantly influenced workers' willingness to use, i.e., the effectiveness of the EKR system. Another deficiency of the ICT perspective relates to the fact that the knowledge to be transferred is often partly or largely tacit and causally ambiguous. This problematic nature of knowledge largely inhibits its mobilization.

## The Problematic Nature of Knowledge

Transfer and utilization of knowledge is not as easy as expected due to its causally ambiguous nature. Causal ambiguity has been defined as the basic ambiguity arising from the nature of the causal connections between actions and results (Lippman and Rumelt 1982). Knowledge is causally ambiguous partly because of its resistance to clear communication (i.e., the presence of component ambiguity) and partly because it is situated in context and its idiosyncratic nature (Simonin 1999, 2004; Szulanski 1996). Meta-analysis conducted by van Wijk et al. (2008) showed that knowledge ambiguity is one of the major determinants of organizational knowledge transfer, in that it is less detrimental to organizational knowledge transfer within organizations than between different organizations. Additionally, ambiguity hampers knowledge acquisition more than knowledge exchange.

Scholars tend to link the causally ambiguous nature of knowledge with the degree of tacitness. The division between explicit and tacit knowledge has been widely used to explain knowledge ambiguity as well as difficulty and effectiveness of knowledge mobilization. Explicit knowledge refers to knowledge that can be easily codified, explained, and thus transferred from the knowledge source to other recipients/learners, while tacit knowledge refers to knowledge that cannot be codified, is highly abstract in nature, and the knowledge source usually knows more than she/he can tell (Polanyi 1967). Typical examples of tacit knowledge include knowing how to ride a bicycle or how to play tennis. In business organizations, knowledge that is regarded as more tacit includes managerial expertise, marketing communication, and innovative ability (Simonin 1999). On the contrary, organizational routines, manuals, and standardized procedures belong to the more explicit type of knowledge assets.

There is an abundance of research studying how an increase in the degree of tacitness influences knowledge transfer difficulty. For example, Simonin (1999) found that both tacitness and complexity knowledge are positively related to causal ambiguity, which in turn negatively

influences the degree of knowledge transfer between strategic alliances; Lord and Ranft (2000) also found that the tacitness of local market knowledge is negatively associated with its internal transfer within diversified US firms.

Moreover, an increase in tacitness also makes the knowledge largely embedded in its owner, i.e., the person inventing and/or possessing the knowledge (Collins 2007; D'Eredita and Barreto 2006). This embeddedness complicates the transfer and utilization of tacit knowledge among organizational members, as the knowledge holder can largely control and decide whether to disclose and/or transfer what she/he knows tacitly. Moreover, the process of transferring tacit knowledge requires a high degree of participation of the knowledge holder. The transfer and utilization of tacit knowledge becomes not simply a "knowledge management" problem but a "human management" problem instead.

## The Human Factor in Knowledge Management

Human factors can influence knowledge management processes in several ways, e.g., refusing to acquire or learn new knowledge, hiding/hoarding possessed knowledge, miscommunication of knowledge and information, lacking disseminative and/or absorptive capacities, etc. In general, problems arising from the human actors in knowledge management processes can be categorized into two aspects: a motivation aspect and a capability aspect. For example, organizational members have to be both willing and capable to research and assimilate new information in order to create new knowledge or product for the organization. Similarly, organizational members have to be both willing and capable to share and learn knowledge from one another in order to optimize the utilization of organizational knowledge assets.

### The Motivation Aspect

According to the classical theory of reasoned action (Fisbein and Ajzen 1975), people will perform a certain behavior only when they are willing to do so. Motivation of a person to perform is positively related to his/her final behavioral outcome. Such a motivation-behavior relationship has no exception in knowledge management behaviors within organizations.

The source of motivation to perform knowledge management practices has been widely acknowledged to be intrinsic rather than extrinsic (Osterloh and Frey 2000) and there are two major reasons. First, as mentioned above, tacit knowledge is largely embedded in the knowledge holder. Theoretically there is no way to "force" knowledge out of the individual by any kind of extrinsic intervention. Second, the creation, sharing, and utilization of knowledge are generally considered as intrinsically motivating behaviors to workers as they can fulfill people's psychological needs for competency (enhancing one's self-efficacy), autonomy (deciding what to create, share, and utilize as well as whom to work with), and relatedness (participating in a social activity with co-workers) (Deci and Ryan 1985; Ryan and Deci 2000). Thus, it is assumed that workers are naturally attracted to knowledge sharing to pursue the psychological needs mentioned above. Empirical evidences lend support to such an assumption. For example, Bock and Kim (2002) found that employees' expectation of relationship improvement with other co-workers (i.e., sense of relatedness) and making contribution to the organization (i.e., sense of competency) had positive effects on their attitude toward knowledge sharing. Similarly, Martin-Perez et al. (2012) showed that intrinsic rewards such as the improvement of self-fulfillment and self-identification had a positive influence on workers' willingness to share their knowledge.

However, from a managerial point of view, reliance on workers' intrinsic motivation to perform is risky. For example, Osterloh and Frey (2000, p. 540) comment that "intrinsically motivated employees do not always work to the benefit of their employers... Rather employees must be motivated to perform in a *coordinated* and *goal oriented* way." Otherwise, negative consequences such as infinite procrastination will occur if workers are only managed and driven through intrinsic motivation (Malott 2005). Besides, Kamoche (2006) and Wilkesmann et al. (2009)

warn that one should not assume workers ought to cooperate and share what they know naturally given the costs and risks (e.g., loss of time and productivity, damage of personal reputation, forfeit of appropriability, etc.) associated with cooperation. Connelly et al. (2012) and Husted and Michailova (2002) even argue that hiding or withholding is often a more favored choice of workers due to their self-interest.

To compensate the risk-averse mentality of workers, some scholars suggest turning back to the use of extrinsic motivators (e.g., the provision of monetary rewards and promotion opportunities or the imposition of punishment in the opposite) to alter workers' perceptions of benefits and costs associated with knowledge management practices (Hung et al. 2011; Osterloh and Frey 2000). While criticisms exist regarding the "crowding-out" effect of extrinsic motivators on the intrinsically motivated nature of knowledge management practices (Adler 2001; Nahapiet and Ghoshal 1998), there is an alternative view on the "dual effect" of extrinsic motivators – extrinsic motivators may also have a facilitative effect on intrinsic motivation of workers in addition to the postulated crowding-out effect (Briscoe 2007; Turner and Makhija 2006). Hence, the role of extrinsic motivator remains a subject of debate in knowledge management studies and its effect on motivating workers to engage in knowledge management practices is not conclusive at the time being.

### The Capability Aspect

Besides willingness, whether workers can successfully create, learn, or apply new knowledge also depends on their individual capabilities. Two types of capabilities are particularly relevant in effectively utilizing organizational knowledge assets: absorptive capacity and disseminative capacity. Absorptive capacity refers to "the ability of a firm [or an individual or a group] to recognize the value of new, external information, assimilate it, and apply to commercial ends" (Cohen and Levinthal 1990, p. 128). The level of absorptive capacity possessed is largely a function of prior related knowledge, i.e., previous experience in utilizing similar knowledge. The higher the absorptive capacity possessed, the easier it is to learn, apply, and further create new knowledge based on one's prior related knowledge and experience. Research findings have proven the importance of absorptive capacity on effective knowledge creation, sharing, and utilization. For example, Gupta and Govindarajan (2000) found absorptive capacity to be one of the major determinants to the degree of knowledge inflows into subsidiaries of multinational corporations (MNCs); Vasudeva and Anand (2011) found that knowledge utilization between firms that formed alliances are significantly influenced by the lack of absorptive capacity when facing new and novel knowledge.

Disseminative capacity refers to "the ability of knowledge holders to efficiently, effectively, and convincingly frame knowledge in a way that other people can understand accurately and put their learning into practice" (Tang et al. 2010). This is a crucial ability to share newly created or acquired knowledge throughout the organization. Lack of disseminative capacity causes communication problem between the knowledge holder and receiver(s) in that the knowledge holder would fail to encode and transmit the knowledge in a meaningful and easy-to-understand way. In other words, the knowledge holder would find difficulty in expressing and teaching if she/he lacks disseminative capacity. Higher degree of knowledge tacitness leads to stronger disseminative capacity needed from the knowledge holder.

### Communication of Knowledge Between Sender and Receiver

As hinted above, effective creation, sharing, and utilizing of knowledge depends on successful communication of knowledge between the knowledge holder/creator, mostly referred to the sender, and the seeker/learner, i.e., receiver. The SMCR (sender-message-channel-receiver) model as initially proposed by Shannon and Weaver (1963) has been widely adopted in the field of knowledge management (see Fig. 1). The model states that effective communication of knowledge is influenced by (1) attributes of the sender, (2) attributes of the receiver, (3) attributes of the knowledge per se, and (4) the communication channel

**Knowledge Utilization in Organizations, Fig. 1** SMCR model. (Adopted from course material of Unit 3, B823 OUUK, p. 15, Fig. 3.1)

chosen. While the first three factors have been discussed in the previous sections, the following paragraphs focus on the fourth factor – the chosen communication channel.

Media richness theory (Daft and Lengel 1986) has been commonly used to characterize communication channels as either rich or lean in nature. When the message, or knowledge, is highly tacit and/or complex, a richer communication channel, i.e., more direct, face-to-face interaction, has to be adopted. On the contrary, when the message or knowledge is rather simple and explicit, a leaner and more indirect channel such as document exchanges can be used to achieve efficiency and cost saving. Hansen et al. (1999) termed the two opposing (rich Vs. lean) types of channel *personalization* and *codification*. In their study, they found that companies emphasizing either one, but not both, of the channels as the major knowledge communication channel within the organization based on the characteristics of the knowledge involved are able to more efficiently and effectively leverage their knowledge assets.

The distinction between personalization and codification has been widely used in different studies to predict knowledge creation (e.g., Nonaka and Takeuchi 1995), knowledge sharing (e.g., Joia and Lemos 2010), and knowledge utilization (e.g., Chai and Nebus 2012). The overall thesis is that personalization allows closer interaction between the sender and the receiver and is thus more conducive than codification for exploration of new knowledge and utilization of tacit knowledge. On the contrary, codification is more useful than personalization to exploit existing (explicit) knowledge, i.e., to leverage the economies of scale of existing knowledge assets, since theoretically codified knowledge can be disseminated across geographical and temporal boundaries and are able to reach a large amount of receivers.

## The Managerial Perspective

Next, we should consider what and how managers can do to facilitate the utilization of organizational knowledge assets. However, it is surprising to know that the managerial perspective has been rather vague as researchers approached the knowledge management "slide either to a 'knowledge' or a 'management' pole, or move away from what may be seen as typical meanings of these two labels... Put bluntly, the more management, the less knowledge to 'management,' and the more 'knowledge' matters, the less space is for management to make a difference" (Alvesson and Karreman 2001, p. 996). Moreover, for managers and researchers advocating the intrinsic motivation assumption of knowledge work, there is basically no role for management as any external imposition of managerial intervention will crowd-out the intrinsic drive of workers.

Recognizing all similar limitations of the extant literature, Foss et al. (2010, p. 467) criticized that "managers are not optimally equipped by the current literature to make decisions about how to embed knowledge sharing initiatives in existing organizational structures and cultures" and proposed the need to devise more concrete managerial measures to "govern" knowledge management initiatives.

Nevertheless, there are still some models in the literature that can provide managers with useful insights and implications on how to manage knowledge assets within their organization. The sender-receiver communication model that we have discussed is certainly one of them. Managerial implications of the model include the need to reinforce workers' motivation and train their capabilities to communicate knowledge as well as the need to establish appropriate channels, both rich and lean ones, to serve as conduits or platforms to communicate knowledge.

Another example is the classic knowledge-creation spiral, or the SCEI, model developed by Nonaka and Takeuchi (1995) (see Fig. 2). The model describes how existing knowledge assets transform into new knowledge through workers' utilization and communication. The transformation process goes through four stages: socialization, combination, externalization, and internalization. In the process, managers are best viewed as "catalysts" – inspiring and arranging an appropriate *ba* for the transformation process to occur. *Ba*, in Japanese roughly means "place", is defined as a "shared context for emerging relationships" that provides a platform for advancing individual and collective knowledge" (Nonaka and Konno 1998, p. 40). *Ba* refers not just to a physical space such as an office but also a specific time-space, or the relationships among people in that specific time-space (Peltokorpi et al. 2007, p. 53).

More specifically targeted on the managerial perspective, Alvesson and Karreman (2001) proposed a typology of knowledge management approaches, which identifies four major orientations of modern managers toward knowledge management: knowledge management as extended libraries, knowledge management as community, knowledge management as normal control, and knowledge management as enacted

**Knowledge Utilization in Organizations, Fig. 2** SCEI model (Peltokorpi et al. 2007, p. 55)

blueprints (see Fig. 3). In practice, managers adopting the extended library orientation view knowledge management as kind of system problem – "knowledge management primarily consists of highly structured and easily accessible codified experience, stored in databases and accessed through the company-wide computer network" (Alvesson and Karreman 2001, p. 1009). Some managers can move beyond the extended library orientation to view knowledge management as a kind of communal activity. For them, knowledge management is the arrangement of "informal, everyday-based exchange of ideas mainly amongst people who are being physically close to each other" (Alvesson and Karreman 2001, p. 1009). Managers seeing knowledge management as an element of normative control strive to build a "sharing culture" that socializes workers to actively contribute what they know to the organization. However, managers who exert too much control on the knowledge sharing norms may end up developing "templates for actions" for their workers. In Alvesson and Karreman's words, these managers are *streamlining* knowledge production and *trivializing* knowledge, somehow going back to the extended library orientation that focuses on the storage and utilization of a catalogue of templates that they think can generate performance and minimize waste or inefficiencies. Summing up their arguments, Alvesson and Karreman suggested that managing organizational knowledge assets is as likely, if not more so, to operate as a practice of managing people or information than as a practice attuned toward facilitating knowledge creation.

## Conclusion

This chapter discussed some major issues regarding knowledge utilization in organizations. First, it is acknowledged that knowledge represents the core production in modern businesses despite the fact that there is a lack of consensual definition of it. In other words, knowledge is still an umbrella term that is subject to interpretation of its user. Nevertheless, in business organizations, knowledge is usually defined as the know-what, know-how, and know-why for performing tasks (Brown and Duguid 1998; Kogut and Zander 1992) that may appear in forms of impersonal, organizational routines (i.e., explicit knowledge)

**Knowledge Utilization in Organizations, Fig. 3** Mode of managerial intervention (Alvesson and Karreman 2001, p. 1005)

or personal, subjective interpretation and capabilities (i.e., tacit knowledge). The approach workers and managers use to create, share, and utilize knowledge greatly depends on the degree of explicitness/tacitness of the concerned knowledge. Readers may reflect on the importance of developing a universal definition of knowledge or, as most of knowledge management studies did, choose to bypass the issue of definition and focus on the characterization of knowledge.

Second, the ICT and human perspectives to managing knowledge were introduced. Viewing knowledge management as a technical problem is probably the easiest and commonest approach, but such views has its own limitations and might oversimplify knowledge management. The sharing and utilization of tacit knowledge, on the contrary, requires high degrees of involvement of both the knowledge holder and the learner. In other words, the management of tacit knowledge is interrelated with other human factors, including the willingness, capabilities, and mode of communication of the sender and the receiver, as well as the possible risk-aversion mentality of people to disclose and contribute what they know. Hence, in addition to the influence of knowledge characteristics, readers may also reflect on the risk-aversion mentality of workers and analyze how the possible tensions between the workers and their employer arisen might affect the implementation of knowledge management practices.

Last but not the least, limitations of the current literature on the managerial perspective of knowledge utilization were highlighted. Compared with research on knowledge characteristics or human attributes, research on managerial approaches to manage knowledge assets has been relatively immature and disorganized. While there are several models for managers' reference, the current literature still fails to "adequately address how firms can manage the knowledge flows across different employee cohorts" (Kang et al. 2007, p. 243) and the disorganized and scattered nature of past studies inhibit the generation of "a truly cumulative body of knowledge" (Argote et al. 2003, p. 572). Although managerial intervention has limited use under the assumption of intrinsic motivation, it is still necessary. However, it is "exercised through very different mechanisms in two kinds of firms" in that knowledge firms "may be differentiated from "traditional firms" in terms of governance mechanisms by relying less on direction through the exercise of authority" (Foss 2007, p. 32). Readers may thus reflect on the appropriateness of the prevalent intrinsic motivation assumption of knowledge work and consider whether the willingness of knowledge workers can or cannot be reinforced by traditional "carrot-and-stick" approach or by any other new human resource management approaches.

# Korean Firefighters' Own Emergency Management and Its Implication

Kyoo-Man Ha
Department of Emergency Management, Inje University, Gimhae, Korea

## Synonyms

Emotion-based emergency management versus rationality-based emergency management; Role of Korean firefighters

## Definition

Emotions including anger, hate, sorrow, and fear affect firefighters' reasoning process and thus may have a negative impact to emergency management. Emotion-based management employs affective decisions when firefighters deal with emergencies. On the other hand, rationality is important to enable firefighters to find and carry out solutions. Rationality-based management follows reason and logic when addressing emergencies.

## Section

Comparative and development public administration and policy.

## Introduction

South Korea (hereinafter Korea) has set up its own national emergency management system though incomplete. At the level of central government, the Ministry of Public Safety and Security (MPSS) is mandated to handle all kinds of emergencies by providing related policy guidelines. However, by managing mainly three frequent emergencies, namely fires, flood accompanied by typhoon, and maritime accidents, the MPSS consists of firefighters, civil engineers, and maritime policemen, with other sectors not represented. Local governments (e.g., province, city, Gun, and Gu governments) are to manage local emergencies by following the MPSS' policy. The extent of local autonomy in terms of emergency management is not so high, when thinking that the nation has developed a unitary government system. Accordingly, each local government has three sections, namely the fire station, the section of disaster prevention (or civil engineering), and the coast guard.

Firefighters, as public employees, are recruited on a regular basis. Candidates have to pass the national civil service exam and the physical test as well. After working for local governments for a certain time, few local firefighters may have an opportunity to work for the central government or vice versa. Firefighters at the central government fiercely compete with civil engineers and maritime policemen in terms of budget allocation. They then spend their funding for national agenda. Local firefighters spend their local budget for local agenda with the partial support of central government. When reflecting that Korea has not substantially set up its national emergency operation framework yet, the extent of coordination between not only firefighters but also other professionals is not so robust.

Among various professionals, firefighters play a major role in fighting not only fires but also other emergencies, regardless of national boundary. They are tasked to extinguish fires, rescue emergency victims, provide emergency medical services, and others. They experience a lot of stress that can be aggravated under hostile environments. Therefore, having an effective emergency management is important and may be the driving force behind firefighters' strength and resilience (Gartenstein-Ross and Dabruzzi 2008).

The number of fires in Korea was between 40,000 and 50,000 in recent years (Fig. 1). Korean firefighters or related stakeholders have also tried to manage diverse hazards. Despite their efforts, however, they have emotionally approached key issues, such as the need for an independent agency, the employment status of firefighters, the post of incident commander, and others. Further, no research has been done to study related emergency management particularly via the

**Korean Firefighters' Own Emergency Management and Its Implication, Fig. 1** Frequency of fires in Korea (MPSS 2015)

international perspective. With all the above in mind, it is the right time to delve into the Korean firefighters' emergency management.

Realistically, Korean firefighters continue to be challenged, such as in terms of lack of funds, poor social standing, accidental deaths in the practice of profession, among others. At the same time, they have made efforts to improve their environment and status by relying on nontraditional alternatives to include political support for election candidates or connection with politicians, mass media exposure to document heroic acts, and frequent political speeches on their contribution to the society, among others.

However, the biggest problem is that Korean firefighters pursue their self-interests either directly or indirectly, in the process making them extremely aggressive toward their strategies. Consequently, firefighters become emotional in their expression of unmet goals and complaints. Further, in the practice of emergency management, this emotional approach among firefighters has caused serious challenges and obstacles in achieving effective emergency management among all stakeholders.

As an example, the ferry Sewol sank around Jindo Island in April 2014. Out of the 304 casualties, majority were high school students (Griffiths et al. 2017). The public was outraged by this unfortunate event. To help defuse the situation, the Korean president transformed the National Emergency Management Agency (NEMA) into the MPSS. At that time, Korean firefighters strongly expressed their concerns over the system of Korean emergency management. While they expressed their intention to dominate the field, they missed to consider modern emergency management that should also cover comprehensiveness, equality, and the overall assessment of social impact of an emergency. In the end, the firefighters' emotional reaction has hindered the accomplishment of modern emergency management in Korea.

The Korean case should be an interesting topic to examine not only for Korea but also for other nations. Though the nation is evaluated as a developed country, its modern fire management was started just about 10 years ago. In addition, there have been many complicated issues in the field that relate to culture such as factionalism, selfishness, and hegemony and thus have caused some frustration to some people. Similarly, the process of emergency management has been rapidly changing in recent times. Thus, many nations may be able to learn from how Korea will overcome through the barriers or they may compare the Korean case with their cases, when necessary.

The goal of the entry is to see how Korean firefighters have managed their own emergencies under a unique culture (or under own organizational atmosphere) and then provide appropriate alternatives for the ultimate goal of emergency management. This entry has compared emotion-based management and rationality-based management via four analytical variables, namely the central government's policy, local fire officers' strategy, mass media's focus, and residents' interests (Fig. 2). This study maintains that stakeholders in emergency management should

**Korean Firefighters' Own Emergency Management and Its Implication, Fig. 2** Research design

practice rationality-based management instead of allowing emotions to prevail, as this may cloud arriving at sound judgments.

## Emotion-Based Management

### Central Government's Policy

Three institutions have worked for fire management at the central government level. The MPSS (or also known as the former NEMA) has been a leading institution dealing with firefighting and related emergencies, while the Korea Forest Service (KFS) has worked mainly for mountain fire management. The Korean National Assembly has also worked for fire management via related legalization (KFS 2017).

Among the three, MPSS firefighters have frequently expressed their preference to establishing an independent agency for them with the support of some politicians in the Korean National Assembly or president candidates during 2017 presidential election (Table 1). In doing so, firefighters have often cited the case of the Fire and Disaster Management Agency (FDMA) in Japan, in which firefighters play a major role in managing various disasters in the region. By discussing the activities of Japan's FDMA, Korean firefighters have emphasized the need for urgently setting up a similar agency in Korea. Similarly, by pointing out the short distance or a similar culture between the two nations, Korean firefighters consider the case of FDMA to be their best choice. In case of organizational reshuffle, such firefighters have always maintained that they need an independent agency without incorporating other professionals. By fighting against fires alone under their own culture, they have emotionally attempted to improve the productivity of emergency management.

### Local Fire Officers' Strategy

Local fire officers have worked at either the provincial (being equal to US state level) headquarters or many local stations in the community. They

**Korean Firefighters' Own Emergency Management and Its Implication, Table 1** Specific data on emotion-based management

| Units | Specific data |
|---|---|
| Central government's policy | On February 2017, while criticizing the current administration, a Korean National Assemblyman (Moon, Jae-In) maintained the necessity of setting up the independent firefighting agency.<br>On October 2014, the opposition party in the Korean National Assembly proposed a bill to set up an independent agency for firefighters, without considering other stakeholders' interests.<br>On July 2013, the NEMA administrator, who is a firefighter, expressed his support for firefighters' independent agency via an official document (i.e., How to improve firefighting). |
| Local fire officers' strategy | On March 7, 2017, about 42,000 local firefighters wanted to change their job status to become central government employees, in particular by supporting a presidential candidate (Lee, Jae-Myung) during his election campaign.<br>Similarly, on June 25, 2014, local fire officers emphasized that they should become central government employees, without thinking of the lack of public funds.<br>On April 3, 2008, about 50 local firefighters in Chungju maintained that they should be incident commanders at emergency spots. |
| Mass media's focus | On December 22, 2015, fire prevention news reported that despite hard chores, firefighters could not get the appropriate amount of pension after their retirement, without reporting other emergency responders' troubles.<br>On May 28, 2014, KBS broadcasted that firefighters should be allowed to govern not only the police but also military soldiers in joint field offices. |
| Residents' interests | In the beginning of 2017, the MPSS characterized firefighters as "hero (or Youngung)," and then distributed it to local communities to further improve the image of firefighters.<br>By end of 2015, many local communities including Gyeongju, Yongsan, and Uijeongbu officially chose some firefighters as their heroes, without nominating other professionals as their heroes.<br>In 2015, with the support of residents, a business corporation (i.e., S-Oil) awarded USD 90,000.00 to eight firefighters as heroes of the year. |

(Sources: MPSS 2017)

have been officially employed by local governments. It means that a certain group of local fire officers is employed by a specific local government and thus work for their mission within a limited area. In this regard, local fire officers have often maintained that they should no longer be employed by local governments, but by the central government to improve their productivity, particularly to mitigate injuries and casualties by fires. Majority of local firefighters believe that casualties in their jobs are much related to their job status of local governments' employees. In so doing, local firefighters have expressed their preference to becoming central government's employees even without substantial scientific researches or evidences. Furthermore, there is no clear linkage between local fire officers' employment status and related human loss.

Local fire officers have continued to maintain that they should become incident commanders in joint field offices. While discussing who will be the incident commander on each emergency, local fire officers have strongly advocated that they are the right individuals for the position under their own culture (Kim 2014). However, their theories are not perfect at all. For example, when mega fires occur in a remote place, it is quite expected for local fire officers to be the incident commanders, when reflecting that how to deal with various fires is a sort of firefighters' responsibility. However, they want to be the incident commanders during the occurrence of nuclear power plants' radiological emergency, the outbreak of pandemics, and others. As of now, just a few firefighters in Korea have an ability to deal with aforementioned emergencies. In short, local fire

officers as humans with limited capabilities have claimed that they, as the incident commanders, could manage all hazards on the ground better than others could.

### Mass Media's Focus

Firefighter bravery has been spread recently in diverse mass media, such as Twitter's rapid update feature and conversational update feature (Panagiotopoulos et al. 2014). However, a few members of the mass media have viewed firefighters as a hungry image or struggling image under the Korean culture. Firefighters have been described as a sort of unfortunate professionals in the field of emergency management when compared to civil engineers. Without being paid fairly, firefighters have been faced more frequently with human loss than other professionals, according to those mass media.

Many factors may explain why the mass media have called firefighters as hungry, struggling, or unfortunate. Among them, partially because mass media have strongly sympathized with firefighters and their situation, they have allocated much space or time to describe the poor status of firefighters. In short, mass media have emotionally discussed and have shown concern not only on the firefighters' high level of stress but also on their attempts to set up an independent agency, their aspiration to change their employment status, the attempts to dominate the post of incident commanders, and others.

### Residents' Interests

Residents have psychologically supported young soldiers, thinking that not only their sons but also a few daughters have worked for the Korean military as part of compulsory duty. A similar psychological mechanism has been operating in the case of firefighters. Although the job of firefighters is by choice, many residents have emotionally taken side with their sons and daughters' stress from dire fires as well as related human loss (Lee et al. 2014).

Following the assertion of mass media, many residents, under their own culture, have considered some firefighters as their heroes in the community. When firefighters have faced difficulties in achieving the establishment of an independent agency, the change of employment status to become central government's employees, or the willingness to manage all ground hazards, many residents have willingly expressed their sympathetic support. To put it in other words, mainly because the working environment around firefighters is so challenging one way or another, many residents have emotionally advocated for the situation of firefighters.

## Rationality-Based Management

### Central Government' Policy

Firefighters in the MPSS may maintain the establishment of their independent agency, as long as it has more productivity toward the goal of emergency management than it does now. The case of Japan's FDMA should be a good example for Korean firefighters' benchmarking, when considering similar Confucian culture between the two nations. However, those firefighters want to set up their own agency to dominate the field of emergency management, in particular without being checked by other stakeholders including civil engineers and maritime police.

While thinking that emergency management is to coordinate the efforts of all stakeholders, firefighters or some politicians need to coordinate not only firefighters' efforts but also other stakeholders' activities to improve the goal of emergency management (DHS 2013). Substantially, Japan's FDMA consists of diverse professionals, even though it has the word "Fire" in its official institutional name. Rather than attempting to set up their own agency, Korean firefighters must consider how to coordinate rationally among various government agencies, businesses, volunteers, and institutions, and make this part of a new culture. As long as firefighters continue to maintain the establishment of their own independent agency, it will cause potential conflicts among various professionals.

### Local Fire Officers' Strategy

When local fire officers' job status shifts from local governments' employees to the central government's employees, they may get more

personal benefits as well as better firefighting equipment. However, they have hesitated to mention related personal benefits. Also, whereas local governments do need local firefighters for their community, the central government plays a role in deciding important policy issues for the firefighters. Hence, local fire officers must rationally reveal all related facts on their status, on certain cases. In other words, the shift to central government's employees will not guarantee that local firefighters' unmet needs will be addressed.

Further, a few local fire officers do not prefer their job status change to the central government's employees, mainly because they do want to stay in their hometowns or communities. If they change to become central government's employees, they will then be obliged to move to many places within the nation, following related regulations and laws (Park 2017). In reality or in general, people, including local fire officers, want to spend their time with their families, and so they will not prefer moving away.

Local fire officers may wish to become the incident commanders regarding any emergency. However, it is clearly impossible for them alone to deal with all ground emergencies, if thinking that the mechanism of all emergencies is so complicated or unexpected. In cases of radiological emergency or pandemics, nuclear scientists or quarantine personnel may be more qualified to serve as incident commanders. Therefore, local fire officers have to admit that not they, but individuals with specific capabilities should be incident commanders under a new culture.

### Mass Media's Focus

Mass media as a robust bridge among firefighters, governments, and the public have to report facts on a series of fires and related management (Brengarth and Mujkic 2016). To this point, firefighters have developed not only a hungry, struggling, and unfortunate image but also as lifesavers and regular citizens of the nation. Therefore, related mass media must equally or rationally deliver those two different images to all stakeholders, in particular by changing the culture.

Partially because a few members of mass media have sincerely sympathized with inferior situations around firefighters, it does not mean that mass media should have continued to broadcast firefighters' unpretentious status in particular without fully relying on clear reason and logic. By discussing not only the disadvantages but also advantages of being firefighters, mass media may let the people know about the truth on firefighters' movement toward an independent agency, the aspiration to reform their employment status, the challenge of occupying all posts of incident commanders, etc. In other words, the mass media must keep the unbiased coverage or neutral position when discussing any topic to include the reality of firefighters in Korea. Further, the mass media may ultimately improve the incomplete status of firefighters, while doing so.

### Residents' Interests

It is understandable that residents continue to express their love and support for firefighters in the community. As parents, brothers, and sisters, they sympathize with firefighters' challenging tasks and the risks they face, which is why they are considered as community heroes. In short, many residents' expression of support toward firefighters shows the warmth of Korean society. As one of those extremely dangerous jobs, firefighters have substantially contributed to emergency management in the community (Eriksen and Prior 2013).

How hard firefighters have made activities for local emergency management must not simply lead to the fact that residents should follow firefighters' emotional assertion. The hardship of firefighters is one thing, and local residents' support for emotional approach is another. Therefore, residents have to rationally analyze related productivity on several thorny issues as part of a culture, with the support of an improved role of the mass media. When residents are unable to obtain appropriate analysis on those thorny issues in time, they may communicate with other stakeholders via various information networks.

## Major Implication

With the two opposite styles of firefighters' emergency management, it is inevitable for the Korean field of emergency management to systematically

change its emotion-based management into rationality-based management. Emotion-based management is a barrier to efficient emergency management because it affects productivity or job performance, one way or another.

The current emotion-based management exists in the Korean society because of many factors, such as complicated politics, administrative focus, economic struggle, social atmosphere, and individual motivation. In short, the firefighters' present behavior has been a product of the current emergency management system in Korea. In this regard, Korea has to reform by addressing various factors including leadership, structure, procedures, and even culture (Liou 2016). Without planning, it would be impossible for the nation to transform into rationality-based management.

Broadly, the Korean field of emergency management needs to incorporate all stakeholders' interests into related processes on the way to reform. When considering only firefighters' interests, the nation will not fundamentally change the base of firefighters' emotion-based management. By combining public resources into private resources, addressing the significance of multiple networks among various individuals and institutions, or utilizing multiple instruments, the field will be able to persuade all stakeholders into joining reform in the near future (Bowornwathana and Poocharoen 2005; Peters and Pierre 1998).

In retrospect, some stakeholders, such as firefighters in governments, have recognized the negative effect of their emotion-based management through their work experiences; however, they have not admitted it publicly. It is also assumed that they have continued to work within a politics-oriented management not to lose any ground under their own culture. Many firefighters have also not understood the negative effect of emotion-based management and continue to be ignorant of the differences between the two management styles.

On the way to changing from an emotion-based management to rationality-based management, there will always be resistance internally or externally or both (FEMA 2015). In particular, those who have vested interests around fire management may cite their resistance to the change as a major characteristic, a spirit, or a tradition of Korean firefighting.

To initiate the change, all four stakeholders need to recognize the risks and dangers of the Korean field of emergency management under the emotion-based management. Without acknowledging the negative aspect of the existing management, any attempt to transition will prove futile. Thus, stakeholders have to be fully or at least partially aware of how they have currently approached their own emergency management.

As long as Korea sticks to the emotion-based management, there will be mainly irrational complaints against efforts on national emergency management. Without proposing or attempting to improve crucial or rational issues, the field would not be able to get into the path of emergency management. Rather, the field would lose its ways by spending time, space, and energy on routinized issues. Accordingly, it will not be helpful for the goal of emergency management at all.

To further address the rationality-based management, the nation has to accommodate a new culture. Fundamentally, all four stakeholders must work together to shirt the culture over time. When a stakeholder fails to improve the culture unlike what has been specified in above section, the whole culture will not successfully facilitate the rationality-based management. Each stakeholder needs to strategically make appropriate culture (Rivera et al. 2015; Wretstrand et al. 2014; Zuschlag et al. 2016).

In terms of wider perspective, the Korean field of emergency management needs to set up various networks with international firefighters or stakeholders by utilizing information and communication technology. By exchanging information and knowledge with firefighters from advanced nations, Korean firefighters may realize how neutrally, rationally, or differently foreign firefighters have approached related decision-making processes.

When setting up information networks and materials that are in another language, Korea needs to translate foreign language into Korean or vice versa. When thinking that majority of Korean firefighters or stakeholders face difficulties in understanding foreign languages, such as English, French, German, and others, network programmers have to utilize a conversion function between different languages. In fact, some foreign data about fire management have been wrongly

interpreted in Korean, such as the concept of comprehensive emergency management and the qualification of incident commander.

Despite Korea's advanced communication technology, it is yet to maximize its benefits when it comes to comprehending or understanding foreign-peer information on firefighting. For the rationality-based management, the Korean firefighters have to exchange information with foreign peers. By seeing them at a far distance or by listening to what others say, Korean firefighters may distinguish how they have been wrong or right (DHS 1999).

With the support of international networks, Korea also needs to teach the differences between emotion and rationality or related matters to all stakeholders. For example, many Korean colleges have offered fire management or emergency management for their students. Thus, educators in higher education have to include related awareness, management techniques, and others into their curricula. In so doing, Korean educators may facilitate the shift between the two managements and introduce cultural change.

Similarly, the Korean field of emergency management may train all stakeholders on rationality-based management. While translating and then introducing advanced procedures to Korean stakeholders, Korea must systematically train stakeholders and use their skills in effective ways. In other words, by fully utilizing training and exercise materials, the nation would embody the rationality-based management.

# Korean Public Administration: Historical Approach

Seok-Jin Eom
Graduate School of Public Administration, Seoul National University, Seoul, Republic of Korea

## Synonyms

Administrative reform in South Korea

## Introduction

This entry examines the history of public administration in South Korea after the liberation from Japanese colonial rule (1910–1945) in 1945. Though the periodization of the history of public administration in South Korea can differ variously according to academic perspectives, this entry divides the history of South Korean public administration into largely three eras considering both the important challenges faced by South Korean society and the major characteristics of government that emerged in the processes of responding to the challenges at the time as follows. The first period is the era of state-building from the liberation from Japanese colonization in 1945 to the early 1960s. This period witnessed the establishment of the South Korean government in 1948, the First Republic (Rhee Syngman administration), and the Second Republic (Chang Myon administration). The second period is the era of industrialization from the early 1960s to the late 1980s. This era can be divided further into the Supreme Council for National Reconstruction following the May 16 Military Coup of 1961, the Third Republic (Park Chung-hee administration), the Fourth Republic (Park Chung-hee administration after the establishment of the "October Yusin ["Revitalizing Reforms"]" system), and the Fifth Republic (Chun Doo-hwan administration). The third period is the era of democratization, globalization, and marketization from late 1980s to the present. This period has seen the instatement of seven Presidents including Roh Tae-woo, Kim Young-sam, Kim Dae-jung, Roh Moo-hyun, Lee Myung-bak, Park Geun-hye, and Moon Jae-in from 1988 and onward in accordance with the Constitutional amendment to the government of a single 5-year term President directly voted by the people.

## Public Administration of State-Building from 1945 to the Early 1960s

As World War II (1939–1945) concluded with the Allies' victory, Japan's colonial rule over Korea ended on August 15, 1945. As the Soviet and US armed forces came to divide and occupy the Korean Peninsula following the liberation, with the 38th parallel north as the border, governments began to be established in northern and southern part of Korean peninsula in the forms of transplanting or imitating the systems of their respective occupying nations. The southern part was governed by the United States Army Military Government in Korea (USAMGIK) during 1945–1948.

The most crucial challenge for a newly independent nation was state-building (Jung 2014). Specifically, the state-building at that time concerned with following issues: the securement of the territory necessary for the establishment of a state; the consolidation of the national identity; the exercise of sovereignty home and abroad; the construction of a political system and administrative capacity for implementing state functions; and the consistency among these constituent elements of a state. The most contentious issue in reality was: whether to found a state encompassing the entire Korean Peninsula or to build a separate government in South Korea (the area south of the 38th parallel north), which was feasible albeit incomplete. At the same time, the questions of the selection of the economic system (from among the free market economic system, social market economy, and socialistic economic system) and the form of the government were important points of contention as well. For example, the efforts to create the first Constitution of the South Korea were made during 1945–1948. The early draft of the first Constitution had included a parliamentary system and a bicameral

legislature as the form of the government. In the subsequent process of enacting the Constitution, however, there were political debates in the constituent assembly regarding whether the form of the government should be a presidential system or a parliamentary system. In the end, the first Constitution stipulated a presidential system and unicameral legislature as the form of the government. In addition, the positions of the President, Vice President, and Prime Minister all were installed as a product of a compromise among diverse political factions (Sung 2008).

Amidst the circumstances of the intensification of the Cold War between the United States and the Soviet Union, division of Korea, and confrontation between the two new countries, the South Korean government came to be established based on the systems of liberal democracy and constitutionalism. The formal separation of powers among legislative, executive, and judicial branches was promulgated in the first Constitution. After the creation of the unicameral National Assembly (legislative branch) through general elections held on May 10, 1948, the Constitution was enacted and proclaimed on July 17. Consisting of 198 legislators for the enactment of the Constitution elected through the May 10 elections, the National Assembly for the legislation of the Constitution enacted the Constitution and the Government Organization Act (July 17, 1948) and elected Rhee Syng-man and Yi Si-yeong as the first President and Vice President of the nation, respectively. The government was founded on August 15, 1948, and administrative power was completely transferred from the USAMGIK on September 13.

Established based on the Government Organization Act, central administrative apparatuses consisted of the Prime Minister, 11 ministries, 4 offices, 1 board, 3 committees, and 6 bureaus under the President and the Vice President. The newly established 11 ministries are as follows: Ministry of Home Affairs, Ministry of Foreign Affairs, Ministry of National Defense, Ministry of Finance, Ministry of Justice, Ministry of Education, Ministry of Agriculture and Forestry, Ministry of Trade and Industry, Ministry of Social Affairs, Ministry of Transportation, and Ministry of Communication. Four offices included Office of General Management, Office of Public Relations, and Office of Planning.

Following the enactment of the Government Organization Act, the State Public Officials Act was enacted on August 12, 1949. It has been argued that this act has been functioned as the foundation of personnel administration in South Korea because this act proclaimed the merit-based civil service system as a main principle of the public human resource management in South Korea. Regarding appointment, for example, this act stipulated that any appointment of public officials should be made in accordance with the result of examination, or the results of selection. In reality, recruitment of new public officials was done mostly through selection rather than examination (Bak 1969). From 1949 to 1960, 96.4% of all appointments were made though "higher civil servants selection," while only 3.6% through the "higher civil service examination" system (Jung 2014; Ahn 2001).

Despite such enactment of the basic institutions for state-building, the administrative bureaucracy of the Rhee Syng-man administration revealed many problems. First, the country not only lacked clear predictions of administrative demand but also insufficiently engaged in discussions on the functions to be performed by the executive branch for national development. More specifically, what kinds of public organizations should be created and what kinds of public officials should be recruited in order to fulfill such functions. Secondly, human resources and financial resources to support the national development were very scarce. Regarding personnel management, the government lacked well-trained professional administrative officials because the Korean people had failed to receive higher education and professional training due to the Japanese colonial authorities' obscurantist policy. Consequently, there was no choice but to employ *en masse* those who had worked as low-ranking civil servants during the Japanese colonial era (Lee et al. 2014). In addition, the appointments of public officials were made according to patronage without screening test on the individual's objective

merit in spite of the articles on the merit-based civil service system in the State Public Officials Act (Song 1998). In terms of government budget, South Korea too much relied on USA for most of the government financial resources. In case of the budget for 1949, taxes took up only 10.8% for the government budget, aid funds, and loans from USA amounting to 13.9% and 46.4%, respectively. Foreign aid funds amounted to a total of US$ 2 billion 88 million during 1954–1961 and took up an average of 49.5% of the nation's total financial revenue (Ministry of Planning and Budget 2007).

In conclusion, public administration during the era of state-building superficially took on the forms of the democratic administrative system but still retained many vestiges of the coercive authoritarianism of the Japanese colonial period in content. Such a characteristic of public administration not only acted as great hindrance even to the pursuit of economic growth through industrialization but also became one reason for social confusion and rampant corruption. Moreover, President Rhee Syng-man created the Liberal Party in 1951 and tried to pass the Constitutional amendment bill to adopt direct presidential election for his own prolonged one-man rule in Busan, the nation's temporary capital during the Korean War (1950–1953). He was defeated in National Assembly by a vote in January 1952, but he succeeded in ramming through the revision of the Constitution to a direct presidential election system in July 1952 with mobilizing the police and army. In 1954, he paved the way for prolonged one-man rule through the so-called "Rounded-off Constitutional revision," which abolished both the legal restriction on a multiple term of office for the President and the position of the Vice President.

In the end, the Rhee Syng-man administration's dictatorship was ended by the April 19 Revolution of 1960. With the ensuing revision of the Constitution in the same year, the gist of which was the parliamentary system and the bicameral system, and the Democratic Party, an opposition party, came to power. With escalating social confusion stemming from the new administration's incompetence due to factional strife within the Democratic Party and the public's demands for the expansion of their right to democratic political participation, a military coup led by General Park Chung-hee took place on May 16, 1961. The people's efforts for democratization including the April 19 Revolution were thus frustrated by the inefficacy of the Second Republic and the intervention of the military.

## Public Administration of Industrialization: From Early 1960s to the Late 1980s

During military rule (May 16, 1961-December 16, 1963), which followed the May 16 Military Coup, the Constitution was revised (December 26, 1962) to establish both a strong presidential system that granted the President administrative power, authority over national emergencies (authority to take emergency measures, authority to declare martial law), and authority to veto legislation. In the ensuing Presidential elections, Park Chung-hee was elected, thus leading to the inauguration of the Third Republic (October 16, 1963).

The most important national task in this era was industrialization for economic growth (Park 2007). Indeed, industrialization was the most crucial issue for not only the South Korean government, all political groups, and intellectual circles in the country but also international actors pursuing a balance of power in East Asia under the Cold War system including the United States. However, these actors differed from one another regarding the path to be trod by the country to achieve this goal. In other words, the problem was "Through what strategies and methods is industrialization to be pursued?" (balanced growth vs. unbalanced growth, import-replacement strategy vs. export-oriented strategy).

The Park Chung-hee administration likewise set the goals of industrialization for economic growth as its foremost task. In order to buttress this, the administration founded the Economic Planning Board (EPB), which had broad authority including the authority to economic planning, budget, statistics, and to coordinate economic

and industrial policies. In addition, the Minister of EPB doubled as the Deputy Prime Minister. Furthermore, numerous ministries related to industrial policy were expanded and reorganized. The Ministry of Trade and Industry, which were in charge of industrial policy in this period, was regarded as "powerful" ministries. The Ministry of Energy and Resources which specialized in natural resources and energy policies, and the Industrial Advancement Administration and the Ministry of Science and Technology were found to guide the industries and to lead science and technology development in South Korea. State-owned enterprises were built in various industrial fields that required large-scale investments including construction and management of infrastructures necessary for industrialization such as roads, harbors, electric power, etc.

Inside government, diverse mechanisms for speedy decision-making and policy implementation were institutionalized. For example, government made regularly the 5-Year Economic Development Plan, which clearly presented the government's policy goals on economic and industrial policy. The President-presided big meetings such as the Monthly Economic Trend Report Meeting and the Expanded Meeting to Promote Exports were held every month to check the accomplishment of the policy goals. In addition, the Office of Presidential Secretariat was expanded to strengthen the President's policy capacity. Diverse administrative apparatuses such as Government Legislation Administration, Board of Audit and Inspection, Office of General Management, and Ministry of Home Affairs also supported the President with carrying out the functions of monitoring, legislation, organization, and personnel management, as well as policy coordination (Eom 2018).

The Park Chung-hee administration was greatly interested in enhancing the capacity of civil servants. It was in this era that a merit-based and professional civil servant system began to be institutionalized in earnest. The State Public Officials Act was revised (April 17, 1963), the essence of which was to adopt the open competition recruitment system based on the results of Higher Civil Service Examinations. The legislation of the Government Employees Training Act (1961, revised in 1973) and the Central Official Training Institute Establishment Act has been evaluated to ensure better training for civil servants (Jung 2014).

Consequently, there were both quantitative and qualitative changes in the bureaucracy in this era. In quantitative terms, the total number of civil servants began to increase considerably. The total quota of civil servants continuously rose following the instatement of the Park Chung-hee administration from 198,281 in 1961 to 371,431 in 1972. In qualitative terms, key officials on the bureau chief level were selected from civil servants who were more educated and younger than the elite in earlier periods. They also had received more Western-style higher education. It has been claimed that there occurred a "shift in generations" in the bureaucracy starting in 1960 and civil servants became more achievement-oriented and had a stronger orientation toward national development (Eom 2016).

In this era, the government budget functioned as a policy instrument for accomplishing industrialization. The institutions related to the government budget and taxes were refurbished to strengthen the domestic capital mobilization and to economize government expenditure. The proportion of tax revenue increased with the installation of the National Tax Service in 1966 and the introduction of value-added taxes in 1976 so that tax revenue came to take up 80% by 1979 while tax revenue and counterpart funds amounted to 30.3% and 30.8%, respectively, in 1962. Financial investments and loans amounting to an annual average of 29.8% were made during 1962–1980, and, on an average, government expenditure took up over 25% of the entire national economy as measured in terms of the gross domestic product (GDP) under the Park Chung-hee administration (Ministry of Planning and Budget 2007).

Public administration has been regarded as one of the driving forces in achieving the compressed industrialization in this era. However, such economic achievement could be accomplished against the backdrop of the stalled development of democracy and authoritarianism. Issues for improving the people's ultimate quality of life

such as welfare, public health, environment, and labor were treated as secondary. The democratization movement in civil society including labors was extremely oppressed. This political authoritarian regime was reflected in the administrative system as well. President Park of the "Yusin regime" himself appointed 1/3 of the total number of seats in the legislature in order to secure the majority of National Assembly seats. President Chun Doo-hwan of the Fifth Republic came to secure far more seats than the actual percentage of votes through elections that were held amidst the prohibition of political activities by 555 figures including major members of opposition parties and, moreover, were based on changes that had been made in order to elect 1/2 of the number of assembly members in local constituencies as those in national constituencies.

With such distorted political systems and public administration, the National Assembly dwindled into a "law-passing branch." In this period, the inspection of state administration and government offices, the South Korean legislature's mechanism for controlling the executive branch, was abolished. Inside the executive branch, administrative powers were highly centralized with a stress on the efficiency of public administration under the pretexts of national security and economic growth. The institutionalization of local self-government system was also withheld and nearly all ministries in the central government installed many special local offices in order to perform their duties at the local level.

## Public Administration of Democratization, Globalization, and Marketization: Since the Late 1980s to the Present

### Democratization

Starting in 1987, South Korean society came to encounter different kinds of national tasks both at home and abroad nearly simultaneously. The first one was democratization. Mass democratization struggles centering on university students from 1985 and onward led to the revision of the Constitution of the Sixth Republic, the essence of which was a single 5-year term President directly elected by the people. Democratization in this era, however, did not just signify the changes of the political system. It also meant the transformation of the entire South Korean society such as: the transition from a government-led growth system to the market-oriented economy; the mitigation of the concentration of wealth on the *chaebols* (conglomerates); the eradication of diverse forms of corruption accumulated from earlier ages; the expansion of political participation of citizens; and the decentralization of the political and administrative systems including devolution (Kang 2013).

The democratization of public administration began with the strengthening of the status and authority of the National Assembly. The President's authority to dismiss the legislature in the previous Constitution was deleted through the revision of the Constitution of the Sixth Republic. The legislature's authority to inspect the organizations in the executive branch and public hearing system were restored. In addition, the legislation-supporting agencies for the National Assembly such as National Budget Office (founded in 2003) and National Assembly Research Service (founded in 2007) have been strengthened to support legislative activities and checks against the executive branch of the members of the National Assembly. National Assembly members' lawmaking activities also became active with the number of legal bills proposed by legislators increasing while the approval rate of bills submitted by the executive branch decreased (Jung 2014).

Legal control over public administration was strengthened as well. Enacted at the end of 1996 were the Administrative Procedures Act and the Official Information Disclosure Act, whose legislation had been postponed by authoritarian regimes during the period of economic growth. These acts aim at contributing to the promotion of the validity and fairness of public administration and the realization of the principles of the rule of law in public administration by guaranteeing citizens' participation in administrative processes and the disclosure of administrative information. In August 1997, various laws for controlling administration including the Framework Act on Administrative Regulations, Civil Petitions

Treatment Act, and Administrative Appeals Act were either enacted or revised (Hong 2010).

Diverse administrative reform initiatives for decentralization have pushed forward. Because of criticism of the "imperial Presidential system" of the previous administration, the Presidential Secretariat was reduced, at least in the early years of the administration. The delegation of the President's authority to the Prime Minister and ministers has been an important issue, too. The local autonomy systems were introduced as well. Local self-government system was restored at the end of the 1980s, the construction of local legislative assemblies in 1991, and the direct elections of the heads of local governments from 1995 and onward. In addition to the formation of local governments, various initiatives for strengthening the local autonomy system have been carried out including the relocation of central government and public agencies, the transfer of administrative functions of central government to the local government, financial decentralization, and strengthening of the capacity of local administration.

Democratization led to increasing the civic participation to public administration in various fields including the environment, labor, peace, and minorities. For instance, nongovernmental organizations (NGOs) such as the Citizens' Coalition for Economics Justice (CCEJ) and the People's Solidarity for Participatory Democracy (PSPD) as well as the associations of trade unions in various industries actively participated in the policy process in related policy fields. Actually, CCEJ and PSPD actively participated in the processes of enactment of the Administrative Procedures Act and the Official Information Disclosure Act in various ways including public hearings for policy suggestions and petitions to the legislature. The government not only acknowledged these NGOs as policy partners but also strengthened support for civil society organizations through the legislation of the Non-profit Private Organization Support Act (Jung 2014).

### Globalization and Marketization

This era can be regarded as the age of global turbulence as well. The global expansion of the capitalist market economy system and the intensification of globalization, where capital, labor, and information freely move among regions and nations, emerged with the big changes at the global level such as the end of the Cold War in the early 1990s, changes in the international trade order including launching of the World Trade Organization (WTO), and the development of information and communication technology (ICT). Globalization was accompanied by the expansion of neoliberalism, which stressed "small government" and "minimal state." This idea suggested the abolishment of government regulation of and the intervention in the market economy as well as the adoption of business-like management in the public sector for increasing the government's efficiency.

South Korean public administration actively responded to the challenges of both globalization and marketization. First, the collapse of the Cold War system was regarded as a good chance to changes the confrontational inter-Korean relationship. In this line, South Korean government achieved some "small wins" including the simultaneous membership of the two Koreas in the UN, the signing of the Agreement on Reconciliation, Non-Aggression, and Exchanges and Cooperation between South and North Koreas in 1991, and the implementation of an engagement policy regarding North Korea with inter-Korean summit talks in 2000, 2007, and 2018.

Second, South Korean government has pursued foreign and industrial policies that actively reacted to the new international regime. Such policies are as follows: *Nordpolitik*, whereby the South Korean government formed diplomatic relations with former communist bloc countries including Russia (Roh Tae-woo administration); the "globalization strategy" including the joining of the Organization for Economic Cooperation and Development (OECD), the opening of agricultural product and commodity markets, the liberalization of foreign currency transactions, the opening up of the capital market, and the liberalization of the people's travel abroad (Kim Young-sam administration); and the signing of multiple

free trade agreements (FTAs) (Roh Moo-hyun administration).

Third, the adjustment of government-led economy to market-oriented economy was pursued in order to meet the new economic environment. For example, the Kim Young-sam administration took measures such as dissolving the Economic Planning Board and stopping the establishment of the 5-Year Economic Development Plan, which were "the symbols of government-led economy." In addition, regulation reforms constitute a major reform task that nearly all administrations in this era.

Fourth, administrative reforms based on neoliberalism were introduced in earnest starting in 1997, the year in which South Korea underwent the Asian financial crisis. For example, the Kim Dae-jung administration introduced not only the privatization of state-owned enterprises but also the management based on performance evaluation system. In addition, public management reform programs that followed the management in the private sector were introduced. For instance, government adopted the agencification of quasi-governmental organizations and expanded outsourcing of administrative functions.

In the field of personnel management, contract-based personnel management, performance-pay system, and team system for restructuring of hierarchical bureaucratic system into horizontal systems were gradually introduced in the public sector while the merit-based, rank-oriented, seniority-based, and closed career civil service system was to be discarded (Eom 2016). These reforms led to the continuous revisions of the State Public Officials Act. For example, this act was revised in May 1999 to adopt Open Position system which aimed at recruiting competent personnel through open competition among applicants from both the public and private sectors. In 2005, the act was revised to build Senior Civil Service (SCS), a government-wide personnel-management system for selecting, preparing, paying, and managing a differentiated group of senior civil servants. This SCS was managed by combining the open competition system (20%), the government-wide job posting program (30%), and the agency-level flexible management system (50%) (Jung 2014).

However, such globalization and marketization did not serve solely as an opportunity for South Korea. It was also one of the sources of socioeconomic crises and instability such as the Asian financial crisis (1997) and the global financial crisis (2007). The administrations in this era have refurbished the welfare and tax systems as a way to overcome these crises and social problems ensuing from the full-fledged introduction of neoliberal systems into corporations and labor. Actually, the basic framework of the overall social welfare system including public assistance, social insurance, and social welfare services came to be established from the Kim Dae-jung administration and onward. At the initial stage of building the welfare system, the government tried to provide appropriate self-reliance support projects in consideration of individuals' work skills, household conditions, and desire for self-reliance and to prevent a decrease in the beneficiaries' desire to work by adjusting the support levels rather than providing universal welfare services. The basic direction of social welfare policy in this era boiled down to "productive welfare." Such a welfare system, however, has gradually changed into a form that provides universal welfare system. Such expansion of the welfare system and welfare services led to an increase in the welfare budget (Ahn 2010).

On the aspect of public management, no less challenging are problems within the bureaucracy. In particular, problems concerning the sense of responsibility and motivation of government bureaucrats have continued to be raised since the period of democratization. Nearly all administrations since the era of democratization have introduced diverse institutions and pursued reform in order to change civil servants who are passive toward their duties and shirk responsibilities yet seek only to exercise their authority. Examples are the neoliberal reforms and the introduction of business-like personnel management systems including the performance-based compensation system mentioned above. The majority evaluation about the effect of the

neoliberal reform program is that such administrative reform programs have had little effect (Eom 2016).

## Conclusion

This entry examined the history of public administration in South Korea with emphasis on the critical challenges faced by South Korean society in different eras. In considering the major challenges that Korean public administration should response to for achieving the national development of the last 70 years, one has to take into account the crucial role played by the public administration. It is especially true that public administration has been the largest organized entity which has had the greatest impact on the lives of the people in South Korea (Jung 2014). Korean public administration, however, has not been stagnated but evolved over time with adapting to different pressures it faced in different eras (Steinmo 2010). As we have seen above, public administration should accomplish the tasks of state-building in 1940s and 1950s in South Korea. In the 1960s to 1980s, however, public administration should adopt new structures and new capacity for pursuing the industrialization. Since the late 1980s, it should change itself with adapting to the demand of democratization from civil society and the megatrends of the globalization and marketization. In sum, Korean public administration has remained as the most powerful political entity in Korean society for 70 years. At the same time, it has had innovated itself in order to adopt a new capacity for overcoming crises and respond to the new challenges home and abroad.

## Labor Relations and Collective Bargaining in the Japanese Public Service

Akiko Izumo
Department of Political Science and Economics, Tokai University, Kanagawa, Japan

### Synonyms

Compensation for regulating labor rights; ILO conventions; Industrial relation; Multiemployer bargaining; Normalization of labor relations; Pay recommendation system; Rate of unionization

### Definition

The essential measure for employers and trade unions to have a conversation about fair wages, working time, holidays, pension, training, and health as the basis for facilitating harmonious labor communication to achieve a productive workplace and labor protection.

### Introduction: Legal Environment of Public Sector Employment

Traditionally, Japanese public-sector employees enjoyed a special status. The appointment of public employees remains a unilateral contract. The regulation of the main employment conditions and their implementation through personnel services is legislated and centralized. This applies to such issues as recruitment, personnel evaluation, training and development, and labor market communications. Pay and terms of employment, such as working time, holidays, disciplinary procedures, and pensions for all public-sector workers are centrally determined. Specifically, pay is determined by legislation based on recommendations by the National Personnel Authority (NPA) and Local Personnel Committees, which study pay standards and make recommendations to the executive and legislative branches. It is one of the most regulated systems of industrial relations in the public service in the world.

### History and Development

Labor relations for the public service in Japan is explained from the following three perspectives: historical background of trade unions and their activities, industrial differences between the public and private sectors, and legislative differences between the industrial and nonindustrial public services.

The historical perspective relates to the postwar reform Japan experienced under the direction of General Headquarters, the Supreme Commander for the Allied Powers (GHQ/SCAP) (Itani 1989). Labor unions' activities were not legal before the Constitution enacted in 1946.

During the industrial revolution, there were some embryonic labor activities of craft unions, such as iron works, trains, and printers, which were influenced by European labor activities. The Factory Act was enacted in 1911 as the first modern labor law to meet unions' request to regulate work time and minimum age of employment, as well as to aid factory workers and their families in illness or death during employment. However, after the Security Police Act was enacted to control the activities of labor unions in 1900, their activities declined and unions disbanded during the war regime. Industrial public officials joined some labor activities, but they were not major forces at that time.

Article 28 of the Japanese constitution ensured workers' basic labor rights. The three major pieces of legislation for workers, the Labor Standards Act, Labor Union Act, and Labor Relations Adjustment Act were enacted to elevate workers' status by promoting labor union activities and collective bargaining. The GHQ/SCAP aimed to promote union activities for Japanese democratization just after the end of the war. On the contrary, the industrial public officials were willing to engage in labor disputes, but could not under the Labor Relations Adjustment Act of 1946. There was a debate in the GHQ/SCAP as to whether to allow labor activities among public officials. Nonindustrial officials except police officers, fire fighters, and prison officers were free to conclude labor agreements and resolve labor disputes for a short period. Their activities were so energetic that they planned large-scale disputes. Public officials even led private sector employees' union actions and thereby could have threatened the effectiveness of the occupation policy (Schaller 1985).

Consequently, public officials were excluded from the definition of workers under the Constitution. The legal position of public sector workers is regulated by a special law and formalized materially by a special regulation that specifies civil servants' rights and duties. The National Public Service Act took prohibitive measures to conclude labor agreements between the government and unions, extending the prohibition on labor disputes to nonindustrial public officials. The Local Public Service Act followed these regulations. The National and Local Public Service Acts shared most of the same provisions. One exception is that the Labor Standards Act did not apply to national public officials, but some of its provisions do apply to local public officials.

Scholars have debated the prohibition of the basic labor rights of public servants. Unions and their activities have been recognized as a symbol of democracy in Japan. The democratization of bureaucracy was a significant reform for the GHQ/SCAP. Scholars expect unions to criticize the management and administrative process of ministries and to join management in promoting efficiency (Tsuji 1995). Unions are a tool for opening bureaucracy to people and achieving democratized and efficient government services. Scholars have called for policies to ease regulations on public service union activities. However, the government has not been willing to do so and alternatively attempted to ensure certain levels of pay to catch up to the private sector level.

The Supreme Court has supported the government policy in a lawsuit disputing whether it is reasonable to prohibit all public officials from striking under the Constitution. The court has provided its interpretation several times, concluding that regulating public employees is reasonable and constitutional. In 1953, the court issued a judgement that considered public officials as working for the public welfare and as servants of all citizens. In 1966, the court showed that regulation should be at a minimum to achieve sustainable public interest. In 1973, the court ruled that public employees had alternative guarantees to public officials, such as stable employment status and the pay recommendation system. Through these judgments, scholars have gradually accepted the regulation and began considering how unions should be engaged in management and policy-making under the regulation. Unions continue to work to achieve basic labor rights.

## Public- Versus Private-Sector Labor Relations

Another perspective on Japan's labor relations relates to the fact that the industrial relations of

public service have been highly regulated since the National Public Service Act was enacted. A series of laws during the postwar reform established labor relations with a clear difference between the public and private sectors. The pay and working conditions of private sector employees are decided by concluding collective labor agreements through negotiations between employers and labor unions. Unions consist of a company's employees as an individual union, including all occupational categories. Actors involved in labor relations usually work in the same company, and their responsibilities are clear.

On the other hand, actors involved in public labor relations are diverse and characterized by multiemployer bargaining. The position might divide the aspects of responsibility among the legislative and executive branches of government, and the NPA and Local Personnel Committees that issue pay recommendations to legislative and executive branches. The NPA was established in 1948 and has this role for national officials. Local Personnel Committees do the same for local officials.

The recommendation system deals with compensation by restricting the basic labor rights of nonindustrial public officials. The NPA and Local Personnel Committees respectively make recommendations according to their scientific comparison of the pay standards of public and private employees, according to each individual's educational background, job status, age, and region (Ozaki 1987). This is an equilibrium policy in which the pay and working conditions of public sector employees should match those of private sector employees.

The NPA also gives advice on pay structure, allowances, and other benefits to balance the public and private sectors. The cabinet determines whether to accept the recommendations and presents the budget, including personnel expenses. The legislature accepts via voting. Until the 1980s, the NPA recommended increasing the pay levels of public employees based on pay increases in the private sector. Since the 1990s, it has recommended maintaining or even decreasing the level.

In spite of these regulations, public sector unions are active in terms of unionization. The estimated rate of public service unionization was more than 70% in the first half of 1990. Table 1 shows that the rate declined to 61.7% in 2000 and 35.4% in 2016. The rate of unionization has been declining, but remains high compared with other industries. One reason for the radical drop in the rate in the last two decades relates to the change in the structure of the public service due to administrative reforms. Many public employees work in industrial and service-delivery jobs, such as the postal service, water supply, education, and social welfare. These jobs are not included in the category of "public service" but are categorized as other industries. For example, postal services are categorized as both postal activities and consolidation services. Most water supply services are owned by local governments but are

**Labor Relations and Collective Bargaining in the Japanese Public Service, Table 1** Number of employees and estimated rate of unionization by industry (Unit: Individual Union)

| | Number of employees (Million) | | Estimated rate of unionization (%) | |
|---|---|---|---|---|
| Industries | 2000 | 2016 | 2000 | 2016 |
| Electricity, gas, heat supply, and water | 40 | 26 | 56.1 | 69.0 |
| Finance and insurance | 227 | 164 | 41.1 | 44.3 |
| Consolidation services | – | 62 | – | 43.2 |
| Public service (excluding classified elsewhere) | 208 | 242 | 61.7 | 35.4 |
| Manufacturing | 1,217 | 981 | 28.0 | 26.7 |
| Transportation and postal activities | 395 | 322 | 37.3 | 26.7 |
| Total | 5,379 | 5,740 | 21.5 | 17.3 |

Note: Table does not include the top six industries with a high rate of unionization
Source: Trade Union Survey (2000, 2016)

categorized as the water industry. Thus, the actual number of public employees outnumbers officials in the "public service" industry.

Moreover, many public enterprises were privatized under administrative reforms since the 1980s. Service-oriented jobs were separated from policymaking or resource allocation jobs, and are contracted out to private entities for more efficient service, introducing business management under administrative reform. After these jobs with a high rate of unionization were recategorized into other industries according to the reform process, the "public service" has become more of a category for administrative positions that function in policymaking or resource allocation rather than service delivery. In addition, officials in these positions are not interested in union activities and are even banned from joining unions of lower officials. Thus, the rate of public service unionization decreased.

## Labor Relations of Industrial Officials

The third perspective relates to categories of public officials. Labor relations in the public service are divided into two categories for industrial and nonindustrial officials. The pay and working conditions of industrial officials are decided by collective labor agreement, though they do not have the right to strike. They developed a labor relations dispensation similar to that of the private sector. Industrial officials work at incorporated administrative agencies whose staff are public servants in the national government. At the local level, industrial officials work at public enterprises that local governments own. Public enterprises operate public services, such as trains, buses, water supply, and electricity. These officials form their own unions or join the unions of nonindustrial officials. In the latter case, they lose their right to conclude collective labor agreements.

Industrial officials were influenced by administrative reforms, as mentioned above. As recent examples, in 2004, national universities, employing 126,000 officials, were transformed into public corporations whose officials are private workers; in 2007, the postal service, employing 254,000 officials, was privatized (NPA 2016). After privatization, these officials have basic labor rights. The labor relations of public sector nonindustrial officials have been highly regulated, but public service labor relations overall were promoted, while the coverage of employees in the public service is clearly decreasing.

## Consultation and Negotiation

Though public employees are classified separately in the unionization statistics, they organize their own trade unions while some ministries and municipalities have two or three kinds of unions in one organization. They usually act independently, but the main industries tend to establish associations of unions. The All-Japan Prefectural and Municipal Workers' Union (JICHIRO), an association of local government unions, is one of the largest union associations for public employees. The Japanese Trade Union Confederation (JTUC) unites these associations across the public and private sectors. Specifically, both JICHIRO and the Japan Public Sector Union, a union of national department officials, have joined the JTUC.

Trade unions in the public sector are called employee organizations in the legislation because employee organizations have restricted basic labor rights. Employee organizations and authorities can conclude documents of mutual consent without legal effect resulting from local-level negotiations. In practice, they attempt to respect each other. Some local governments have introduced a prior consultation system in negotiation. The labor relations of nonindustrial officials are not characterized by negotiation but consultation (Yemin 1993). Authorities need to consult with unions before policy changes, but the scope of consultation differs by government. The topics of consultation are usually changes in working conditions and operations alongside changes in management programs. Unions cannot negotiate administrative management matters, such as the organizational structure, budget, staff number ceilings, allocation, evaluation system, and

standards of punishment. Legislation and administrative regulations determine these matters.

## ILO Conversion and Their Recommendations

Based on the regulated system of industrial relations in the public sector, Japanese labor relations have some issues to address. The first issue is the relationship with the International Labor Organization (ILO). The ILO requested that the Japanese government change its labor relations system according to Convention Nos. 87 and 98. The ILO standards in Convention No. 87 require that all workers "without distinction whatsoever" be entitled to establish and join organizations of their choice without prior authorization. The sole exceptions are the armed forces and police. In addition, ILO standards in Convention No. 98 ensure that a workers' organization can negotiate with an employers' organization to determine their terms and conditions of employment by collective agreement. The sole exceptions are public servants "engaged in the administration of the State" (Yemin 1993). The ILO released several recommendations to the Japanese government with a view to protect Nos. 87 and 98.

The ILO Committee on Freedom of Association released its most comprehensive report in 2002 when the JTUC and Alliance of Public Services Workers' Unions submitted a case to the committee. The committee principally recommended (1) to give the fire service, prison staff, and coast guard staff the right to organize under Convention No. 87; (2) to give public officials without directly engagement in the administration of the State the right to conclude collective agreements and to strike under Convention No. 98; and (3) to stop applying criminal penalties for public officials' strikes.

Unions and scholars argue that the recommendation system obscures employers' responsibility and discourages public labor relations. Since the 2000s, some proposed reducing the institutional difference between public and private employees, as well as that between industrial and nonindustrial officials. This could be considered a normalization process of labor relations (Back 1999).

The basic law for fundamental civil service reform was enacted in 2008, which included a provision to begin discussing the introduction of self-determined labor relations in the public service. Self-determined relations mean reducing the number of actors involved in determining pay and working conditions as much as possible, and that it falls under the responsibility of unions and authorities. This implies that nonindustrial officials have the right to conclude collective labor agreement with legal effect.

At the same time, the feasibility of extending the right to organize to public employees was examined under the Democratic Party of Japan (DPJ) government. It might be most feasible for fire services to extend their rights. A new system was designed and the laws were submitted to Congress in 2011, but were abandoned due to incomplete deliberations. The administration changed from the Liberal Democratic Party (LDP) to the DPJ in 2009. The DPJ administration was active in these legal reforms, but other policies took precedence over labor relations toward the end of their administration. The LDP regained the administration in 2012 and held negative views of the changes to labor relations. Thus, the LDP government maintained the labor rights regulations for nonindustrial officials and the fire service. The government insists on having special disciplines of command hierarchy in fire services, similar to those in the police.

## Political Influence on Bargaining

Politics affect labor relations in the public service. The bargaining range depends on the relationship between leaders and unions. In the national government, the LDP has been in power for a long time. The LDP traditionally protects employers' rights, whereas opposition parties supported trade unions. For example, the JTUC was supported by the Social Democratic Party of Japan until the 1990s, and the DPJ thereafter. Unions have adopted a strategy of consulting the NPA and

supporting politicians under the LDP government while they harmoniously communicate with oppositions parties.

In local governments, conflicts between the ruling and opposition parties of assemblies differ by region. They tend to support concerted candidates of local leaders' elections, like governors and mayors, because it is difficult for them to find appropriate candidates themselves. In this case, conflict between unions and employers is significantly less apparent. Candidates of the ruling and opposition parties oppose each other in some prefectures and cities' elections. In this case, conflict between unions and employers is apparent.

When unions support local leaders, they set bargaining matters broadly. It is difficult to distinguish administrative management matters from negotiable matters in practice. Employee organizations and authorities negotiate matters that they agree to negotiate. Leaders and their agents or general affairs managers attempt to secure union agreement for changes to personnel management policies, such as personnel reassignment of executives and other staff. Staff number ceilings are a general topic in consultations. Recently, many local governments have adopted a policy of entrusting services to private entities, including those providing school meals, cleaning, and preschool education. In this situation, authorities attempt to consult and negotiate with unions on whether to take this measure. Unions worry that authorities might try to cut jobs. Authorities usually act with restraint with regard to layoffs in consideration of basic labor rights and usually wait for staff to retire or transfer staff to other departments that consider labor relations.

A personnel evaluation system is another topic for negotiation and consultation. It was introduced to all officials in national and local governments. The results of the evaluation are used to decide whether to increase basic pay, give promotions, or dismiss employees. Unions were not willing to introduce an evaluation system. The basic pay standard is mostly based on age, rather than achievements according to the evaluation. In this case, unions influence managers' personnel policy decisions. However, authorities negotiated to introduce the system and apply the results of evaluations to management. Sometimes, authorities might introduce reform when unions object. In the long term, the personnel evaluation system will change the pay system to one based on achievement.

An exceptional case of large-scale dismissal concerns employees of the Social Insurance Agency, who were dismissed when the agency was reorganized into the Japan Pension Service in 2010. The Social Insurance Agency was criticized for inappropriate information management when moving data from hard copies to digital. In this process, a large proportion of organized workers and unions performed inefficient work to lower their productivity on purpose. Unions were reluctant to introduce electronic machinery because they feared staff redundancy. Since labor relations were dysfunctional, employers had no channel to change their activities. Stagnant labor relations might be one reason for the improper handling of citizens' pension data.

The LDP administration established a new agency whose officials were not public servants to reform labor relations. Most officials were transferred to the new agency, but 525 officials were dismissed because their posts no longer exist. Although the Public Service Act provides for the dismissal of officials due to reorganization, some union members appealed to the NPA, insisting the dismissals were illegal. The NPA reversed the dismissals of some officials due to inappropriate procedures; however, most were denied. Some former employees launched a lawsuit against the Japan Pension Service.

## Local Leaders and Unions

The second issue relates to union practices. Unions are more active in local governments than in the central government. Local governments essentially have autonomous decision-making power on pay and working conditions, while governors and mayors present local ordinances to set budgets, including labor costs and working conditions. Although the pay and working conditions of many local officials conform to

those of national officials, local governments have political discretion to set pay, allowances, and other working conditions resulting from negotiations with unions. In addition, local assemblies have the right to approve ordinances.

Labor relations differ among each local government, depending on whether there is a high or low rate of unionization and how unions support leaders in local elections. Unions necessarily commit to an election if they wish to influence leaders' policies, though public officials are prohibited from engaging in political activities. Officials cannot be being executives in or advisers of political parties, from collecting or receiving donations for political parties, and from being electoral candidates. Committing to participate in an election is sensitive under these regulations, but unions clearly influence elections.

Some local governments have established moderate and responsive labor relations. Unions understand their employers' situations and attempt to cooperate to solve problems with authorities. By contrast, union activities are radical in some local governments, with unions constantly challenging authorities and opposing any kind of reform that introduces contracting out, personnel evaluation, and pay cuts. Some unions even undertake illegal activities. Some local leaders doubt the effectiveness of introducing self-determined labor relations considering these radical union activities.

## Conclusion

There are some discussions about changing Japan's regulated labor relations, but the normalization process has been delayed. The system for deciding pay and working conditions through legislation based on recommendations has become established. This could be an advantage in that it saves the transaction costs of negotiation and keeps political conflict at a minimum. However, this system does not promote labor communication with authorities. Japan is struggling to decide whether it values democratic control of labor relations or self-determined labor relations for workers.

Trade union or organized labor

## Definition

Labor unions are workers' organizations in specific trade and industry whose aim is to improve members' working conditions and compensation packages.

## Introduction

The United States has had a long association with labor unions. Among the pioneers was the National Association of Letter Carriers, which lobbied Congress to pass an 8-h workday in 1888. Unions were also responsible for passing important legislation such as the Lloyd-La Follette Act (1912), the Retirement Act (1920), and the Classification Act (1923), which supported employee rights. These and other laws demonstrate the importance of labor unions in personnel management. Overall, unions are tasked with negotiating for better wages and benefits. In addition, unions work toward the elimination of arbitrariness in employer actions.

Although organizing has benefits to employees, there are also consequences for unionization. Primarily, unions tend to drive up organizational costs and frequently cause disruptions, especially if they resort to work stoppage and strikes. Strikes have had the tendency to lower public support for union power. But still, the public is skeptical about how much they support union leaders (Panagopoulos and Francia 2008).

Union membership is at an all-time low of 7.2% of the workforce. Although union membership has declined, it doesn't mean that employee organizing is coming to an end. Unions continue to be active interest groups and participate in political recruitment and other electioneering processes. This opens up unions to the realm of public engagement and influence in shaping public policy discourses and implementation. Unions, when permitted, support their friends through campaign funds and also form political action committees. Therefore, it matters most when emerging legislative policy concerns workplace employee rights.

The existence of unions is reinforced in legal frameworks that vary by jurisdiction. No one denies that workers have a right, as citizens, to enjoy all protections enshrined in the Constitution. However, these rights are structured by the nature and type of employment. In public organizations, the most prominent unions are those in the teaching and police professions.

Labor unions are a subset of human resource management systems. Although the context varies in relation to the location of the subsystem, some general principles are identifiable. In public settings, labor and management relations have to take into consideration the overall economic and political conditions of employment. In private employment, labor unions have to confront different rules, the salience of the market in determination of employment. It is also possible that private employers can choose to minimize values such as worker participation in decision-making.

While labor organization in the public sector has undergone transformation, the core idea of participation in workforce matters remains intact basically because union members are a core element of the political process. The bulk of unionized workers are likely to be policemen, firefighters, teachers, librarians, trash collectors, and other public servants. Arguably, government workers do not face the same cutthroat competition evident in private sector organizations. The numbers of private sector-unionized workers have dropped, in part due to the export of manufacturing jobs, and shift toward the service industries. Moreover, greater automation may be changing the nature of work in profound ways, including increasing lower wages temporarily and nonunion work. This shift in the profile of the labor movement magnifies the scope of public law governing unions.

## Overview of Public Law

An overview of public law, through which union activities are structured, can be discerned and discussed. In essence, public law is concerned with the state's interactions with other governments and the people of a state. Public law deals with, among other things, aspects of constitutional and administrative matters, especially the responsibilities of government officials. Roughly two legal approaches can be reviewed. The first deals with laws that concern unionization processes and capacities to assemble and collectively bargain. The second deals with laws that structure events

such as layoffs and reductions in force and complexities arising from collective bargaining.

American capitalism has traditionally viewed labor unions with great suspicion. During colonial times, emigrants into the country found associations that typically restrained trade and hindered representation of workers' interests. Unions emerging from the guild movement and craft industries were viewed with great disdain. Under such conditions, the early antecedents to modern unions were seen as relics of the old world and perceived in the same way as groups likely to have criminal inclinations. Such arguments can be discerned from cases such as *Commonwealth v. Pullis*, *Philadelphia Cordwainers*, *Pennsylvania*, 1806. The *Pullis* case was the first reported case in America arising from disputes between owners of a shoe factory and labor. The ruling was that workers on strike were illegal conspirators. Furthermore, associations such as the Knights of Labor under Terence V. Powderly were mainly underground bodies, which fed to these suspicions. It followed then that American common law, mainly favorable to industrial enterprises, blocked efforts aimed at unionizing.

For much of the early twentieth century, American workers were asked by employers not to join any unions or withdraw from membership, if they were already unionized (Gregory and Katz 1979, pp. 174–184). Unease with labor unions was evident through legal limitations to strikes and other collective work stoppage measures that put pressure on employers to improve work conditions. For instance, in the 1920s, when the railroads were the primary means of transportation and movement of goods from one state to the next, Congress passed the Railway Labor Act of 1926 that limited the potential for strikes among railroad workers. In 1936, airlines were also added to the act's purview.

Before 1935, much of the progress made toward legalization of collective bargaining was skewed toward managerial prerogatives. Labor made substantial gains during World War I when government wanted unions to support the war efforts in return for nonparticipation in strikes. However, the gains disappeared as the Great Depression worsened working conditions. Initially, President Franklin D. Roosevelt and his Labor Secretary, Frances Perkins, believed that administrative regulations and laws to increase wages and improve work conditions for workers were sufficient and there was little need for unions. And through the National Industrial Recovery Act, an attempt was made to guarantee workers rights to collective bargain. Other efforts to bring calm into the working conditions were initiated, but tensions continued to prevail between the administration and Congress. The president and his secretary had wanted the National Labor Relations Board (NLRB) to be housed in the Department of Labor. On the other hand, Senator Robert F. Wagner's (Democrat-New York) idea was that the NLRB be an independent body. Wagner prevailed as Congress embraced his position and passed a law named after him.

The National Labor Relations Act of 1935 (The Wagner Act) was the first major legislative declaration to underscore the federal government's bid to bring together private sector labor relations under its authority. The act created the National Labor Relations Board, which was responsible for investigating and punishment of organizations that violated the existing fair labor practices. The NLRB also has authority to oversee union elections and to certify or decertify unions. The NLRB employs administrative law judges to hear labor relation cases, subject to review by the board itself.

At the end of the World War II, in the 1946 mid-term elections, the Republican Party won control of Congress for the first time since 1931. A group of first-term representatives led by conservative Congressmen such as John Bricker of Ohio, George Malone, and Joseph McCarthy of Wisconsin and Senators Robert Taft of Ohio and Fred Hartley of New Jersey among others were eager to undo much of the New Deal legislation and targeted the Wagner Act as a first step. They subsequently passed the Labor Management Relations Act of 1947 (The Taft-Hartley Act) over President Truman's veto. This act established a National Emergency Impasse Procedure, which gave the president authority to take steps to allow

conflicting parties to "cool off," if a labor dispute endangered national welfare and public safety.

The Taft-Hartley Act ended the practice whereby union membership was a condition for employment. The law also allowed states to pass right-to-work legislation to prevent union contracts from the requirement of union membership as a prerequisite for employment. Employees are thus protected from unions jostling for their membership. The Taft-Hartley went beyond the Wagner Act's emphasis on unfair managerial practices and provided a specific list of union practices that were to be designated as "unfair."

In reality, labor successes of the 1930s and 1940s have not been replicated. One may refer to those years as the zenith of organized labor's gains. Decline of the union movement has been well documented, especially in the private sector. The Labor Management Reporting and Disclosure Act of 1959 (The Landrum-Griffin Act) provided limited guarantees of rank-and-file participation in union activities, especially in the recruitment processes. Union members were also guaranteed freedom of speech constitutional protection while engaged in union activities. One of the driving forces behind the reporting law was to curb the influences of organized crime in labor activities. The law injected a sense of accountability on the part of union leaders and how they managed members' funds. Among the highlights of this law was that persons convicted of felony and other serious crimes of embezzlement were prohibited from holding office in unions. In addition, the law established that periodic elections be held for union offices.

Still, in the 1950s, public sector labor–management relations were underdeveloped, procedurally. The framework for collective bargaining was nonexistent, and in the cases where it did exist, the procedures were modeled after those in the private sector. Significant changes emerged after President John F. Kennedy issued Executive Order 10988 in 1962. The order, which had the force of law, extended the right to bargain collectively and organize for all federal employees. Most scholars agree that Kennedy's action was the pivotal moment in collective bargaining among public sector employees. Until then, the prevailing argument was that organized public employees could not bargain with their employer as coequals.

Moreover, there was fear that collective bargaining in the public sector threatened constitutional democracy, especially if strikes were allowed. Limitations to strikes exist in all the states and in the federal government as well. The general perception is that strikes raise costs to employers and are essential for collective bargaining. From the perspective of government, strikes interfere with government's responsiveness and are not generally seen as serving the public interest. The political argument is that strikes cannot be effective tools for changing public policy.

Executive Order 10988 served as a catalyst for state and local government employees to join unions. As a result, the labor movement was significantly renewed and witnessed a steady rise in numbers. Union members and those having representation were now a sizeable block within the voting population. President Richard Nixon refined the provisions of Kennedy's Executive Order by issuing Executive Orders 11491 in 1969 and 11616 in 1971 respectively. Specifically, Order 11491 gave instructions to heads of federal agencies to ensure that employees were apprised of their rights to freely join and assist labor organizations exercise their mandates. The latter reiterated the need for the Civil Service Commission, in conjunction with the Office of Management and Budget to maintain programs and policies concerning labor–management relations.

In the 1960s, unions endorsed party platforms that supported progressive laws, giving more rights to workers across the nations. Examples of such support occurred in legislation leading to the 1964 Civil Rights Act, the Equal Employment Opportunity Act (1972), and the Equity Pay Act of 1963 (requiring an end to gender-based discrimination). The Civil Rights Act was landmark legislation, which prohibited private sector discrimination in employment and housing. The Equal Employment Opportunity Act amended the Civil Rights Act (Title VII) by strengthening the authority of the Equal Employment Opportunity Commission (EEOC) to enforce anti-discrimination laws throughout the country.

The law covered all organizations with 15 or more employees.

Union support for pay equity was also witnessed when in 1991 the American Federation of State, County, and Municipal Employees (AFSCME) won a court decision concerning pay equity for women. The case originating in 1983 had been filed on behalf of more than 1,000 female 911 operators (police communication technicians) in New York whose previous pay was well below that of their male counterparts. AFSCME's direct action led to pay adjustments for predominantly female and minority officials in law enforcement services. Many other unions have successfully litigated a priori actions by executives in state employment and restored rights to union members. Therefore, unions are active on behalf of their member and directly support political actions that empower their members.

In similar breadth, unions supported President Barack Obama's first signed bill, the Lilly Ledbetter Fair Pay Act of 2009, which was an amendment to the Civil Rights Act. The law makes it easier for workers to challenge pay discrimination (unequal pay). The law allows unfair complaints to be filled within 180 days of a discriminatory paycheck. This means the statute of limitation resets with each new paycheck affected by that discriminatory action.

There was overwhelming union support for the Lilly Ledbetter Act. Among the organizations that gave endorsements to the law were the AFL-CIO, the American Federation of Teachers, the Coalition of Labor Union Women, and the Service Employees International Union. In opposition were various groups that favored management-driven and employer agendas, including the US Chamber of Commerce, the National Association of Manufacturers, and the Society for Human Resource Management (SHRM).

Further consolidation of union engagements with the political process was manifest in the passage of President Jimmy Carter's Civil Service Reform Act (CSRA) of 1978. The CSRA created the Federal Labor Relations Authority (FLRA) that was empowered to bring unfair labor charges and also had substantial say in the management of employment conditions. Although the act guarantees collective bargaining for federal workers, it also regulates nonnegotiable activities such as pay and benefits and classification of government workers.

Another law that structures labor–management relations is the Worker Adjustment and Retraining Notification Act of 1988 (WARN). The law was enacted to protect employees in situations where plant closure is inevitable. According to the act, management has to provide notice to employees at least 60 days prior to closure and layoff. Under the law, all employees are entitled to a notice. Failure to notify makes an employer face a penalty. For example, if notice is not provided within 60 days, employees are entitled to dues even if they didn't work on the days for the period of violation.

## Opposition to Labor Unions

Although the constitutional right to unionize exists, legal scholars point out that the same guarantee does not exist for collective bargaining. This means limitations to collective bargaining are permissible. It has also been established that employees' payment of fees to unions while permissible is not an absolute right. In *Chicago Teachers Union* v. *Hudson* (1986), the Supreme Court ruled that First Amendment due process required procedural safeguards be provided before any deductions could be made as union fees. Among the safeguards are adequate advance notice of reasons and the basis for the fees and mechanisms for audits of funds collected.

These and other legal maneuvers have made it possible for those ideologically opposed to collective bargaining to exert pressures on unions across the nation (Hogler, 2015). As a result, in recent years, there have been attempts to change laws that permit unionization. The right-to-work movement has seen several powerful unions reduced in size. The right-to-work slogan has roots in a Supreme Court ruling *Dent v. State of West Virginia* (1889), which stated that Americans had a fundamental right to pursue any occupation. The courts forbid state legislatures from regulating people's occupations and jobs. A Texas

newspaper editor named William B. Ruggles reinterpreted the courts' ruling to mean the right to work in a unionized business without paying union dues and fees. That interpretation has stuck and informs much of the contemporary anti-union legislation throughout the country.

At state levels, much activity aims to reform labor–management relations through legislation. In much of the legislation, the goal has been to weaken labor and curtail public sector employees' collective bargaining rights. States like Wisconsin passed the Budget Repair Bill (Wisconsin Act 10) which was a requirement that state employees increase contributions to their health care and pension plans, while the state reduced its shares and contributions. The Wisconsin Bill also prohibited automatic deductions of union dues from employee paychecks and gave workers permission to opt out of paying union dues.

Similar anti-union bills were proposed in several other states including Ohio and Michigan where Republican Party governors were elected. In addition, Republican lawmakers in Maine, Indiana, Missouri, and numerous other states introduced legislation that would bar private sector unions from forcing workers to pay membership dues. Although Republican Party officials attributed their actions to budget deficits, members of the American Federation of State, County, and Municipal Employees offered a different explanation. For union members, the rein in unions was payback for the role unions played in elections, giving support to Democrats. For the most part, the right-to-work laws, which prevail in almost all the southern states and in the West, were regarded as receiving support from corporations and the American Legislative Exchange Council (ALEC). The timing suggested that weakening unions was a reaction to union-led opposition to privatization and offshore jobs exports. Globalization and increased reductions in the service sectors have often been associated with outsourced jobs and fed into the narrative reinforced by these correlations.

Union leaders know that laws against unionization of the workforce translate into weakening of the power of labor. And scholars, for example, Zax and Ichniowski (1990), report that laws that are favorable to collective bargaining tend to result in growth of union membership. On the other hand, unfavorable bargaining law can stifle union membership.

At the national level, efforts to streamline labor–management relations were brought to the fore in the 2008 presidential campaign season. In the following year, as a result, the Employee Free Choice Act (EFCA) was introduced in both houses. The bill intended to amend the National Labor Relations Act (NLRA) to offer more efficient means for worker participation in unions and to provide for mandatory injunctions for unfair labor practices. There was also discussion to institute the Federal Mediation and Conciliation Service (FMCS), which would step in to end impasse in cases where employers and unions failed to agree after a 90-day period. The bill had other provisions and but was not signed into law. In 2010, legislatures modified EFCA to accommodate contentious provisions such as inclusion of a card-check system that was intended to end the existing secret ballot voting system but to no avail. The Obama administration rejected the card-check provision of the EFCA, taking the position that union elections should always be confidential and certified. Although at the national level the two parties could not agree on legislation, the right-to-work initiatives gained considerable traction at the state level.

Promotion of right-to-work legislation seems to be touted as a pro-business, pro-manufacturing strategy. And it has worked. Businesses have generally located plants and franchises in states where costs are low and rules weaker. Yet, a 2011 Economic Policy Institute (EPI) study found that wages and benefits are lower in right-to-work states than in non-right-to-work states (Pasulka 2012). Still, the knowledge sector jobs and other service industries were dependent on consumer spending in local economies, and, therefore, right-to-work laws were generally seen as potentially doing harm to a state's economic prosperity.

In summary, the main argument for the right-to-work legislation is that workers have a choice not to join labor unions. In addition, many blame unions for driving away manufacturing through making costly demands on management. As a

consequence, management believes unions have made American manufacturing less competitive.

Opponents of the right-to-work legislation contend that the law allows some workers to free-load on the benefits accrued from union efforts. Dismantling unions, in the long run, will eliminate a huge part of the middle class by lowering benefits and wages and worsening conditions and terms of work for unionized workers. Ever since the signing of the Wagner Act, unions have tended to align mostly with the Democratic Party. Consequently, the party continues to support pro-union initiatives.

Public policymakers continue to look at the two competing groups and reacted, as need be, in the public interest. Overall, the National Labor Relations Board has done much to ensure that workers can unionize. Among the initiatives have been efforts such as streamlining election procedures and processes, making it easier for those who violate labor law to be held accountable and increasing attention for franchise and contractors awareness of violations that can result in penalties.

## Conclusion

It is fair to say the growth of employee unions is an important development in human resource management. Although there is a decline in membership, labor unions continue to play an important role in protection of members from arbitrary disciplinary actions and offer a strong voice in matters of fair wages and benefits. Over the last decade, unions have been criticized for protecting subpar employees and driving up wage bills and labor costs. Although several major public laws govern labor–management relations, there are distinctions to be recognized. Legal frameworks are established in state legislatures, which determine scope of bargaining and limits to organization. Ultimately, the role of legislation is understanding labor practices in both the private and public sectors. Since legislation falls within the political arena, union activities will continue to be a part of public management and democratic government in America and elsewhere.

# Land Governance in Africa

Olugbemiga Samuel Afolabi
Department of Political Science, Obafemi Awolowo University, Ile Ife, Nigeria

L

## Synonyms

Land administrative; Land tenure; Land use

## Definition

Land governance refers to the systems, policies, and politics that determine, guide, and shape the administration over land.

## Introduction

Land is central to human existence and is associated with power, prestige, wealth, and social standing. Its centrality is tied to human rights. Individual and group are incomplete without rights to land and its resources. In many societies and countries, land is used as an indicator of wealth. Wars have been fought over land and were, in time past, a source of constant conflict. Its importance was recognized in philosophical writings such that John Locke, a British

philosopher contended that natural right is inclusive of the right to life, liberty, and property (land), the three dimensions of natural right of every human. He further clarified that land (property gotten from land) is the first and most important out of the dimensions of natural right. The right to land, Locke believed, includes the right of a person to his/her person, and this is the basis of rights of life and liberty. The import of Locke's thesis is that right to land is natural to humans and, therefore, determines other rights to life and liberty as those without access to land are likely to be subjugated to their fellows. This position still holds true today as attachments to and controversies over land permeate every society and have shaped war and peace, dictatorship, and democracy. In Africa, controversies over land have led to killings and genocide as the case was in Rwanda, Nigeria, and South Africa to mention a few countries. Contentions over land have defined relationships, nationhood, and statehood. While it has strong physical geographical features, land covers the surface of the earth, and within it are numerous resources that humans have exploited for profit and sustenance. There is a direct connection between land and humans. It defines relationships in terms of nationality and movements per statehood. Its importance is seen in the disputed concept of stateless persons, which means that there are people in the world without a defined geographical piece of land that can be called their country or state. In terms of politics, land affects electoral/democratic processes as campaigns, votes, and governance are linked to the geographical areas of support. For this reason, land is both political and economic and has consequences on both. At individual and social levels, land is connected to identity, memory, and culture and influences individual/group social, political, and customary ties (Cotula et al. 2009). In Africa, land is intertwined with customs, traditions, and values. Suffice to say, land remains a core factor when assessing the retarded socioeconomic development of African societies and the potential for democratic survival. From Nigeria, South Africa, Malawi, Zimbabwe, Zambia, and Ghana to Botswana, not to mention several other African countries, access to and tenure of land shapes governance and internal strife. Lund et al. (2006) illustrate this position by arguing that land as a conflict-ridden resource, is a sensitive issue, and has many meanings in Africa. Land conflicts regularly occur between neighbors about field boundaries; between men, women, and generations about their respective land rights; between farmers and herders; between states and indigenous peoples; and between companies and local populations about rights to exploit mineral and other resources (Lund et al. 2006: 5). Given these issues and controversies over land in Africa, African countries have come up with land governance strategies that best capture their individual peculiarities. But before examining this, what is land governance?

## Land Governance

The discussion about land presupposes everyone knows what it means. But this is not so in all situations. Land is therefore defined as the section of the earth surface uncovered permanently with water. But land goes beyond this to include the earth surface that is separate from water and mineral resources like oil, gold, and other valuable resources that are in a piece of land. Governance has to do with administration, rules, and procedures. Therefore, governance is driven by promotion of the public good, accountability, rule of law, and competency (Afolabi and Agunyai 2017). Land governance encompasses the rules, processes, and structures through which decisions are made about access to land and its use, the way those decisions are implemented and enforced, and the mechanism in which competing interests in land are managed (FAO 2003). Land governance further encompasses customary, religious, informal, and formal institutions depending on the country. Formal institutions of the state such as land agencies, courts, and ministries and municipalities responsible for land constitute governmental structures for land governance and management. Informal structures include land speculators, developers, and traditional bodies. In public policy and formal state structures, land governance operates through legal and policy

framework while incorporating traditional practices governing land transactions, inheritance, and dispute resolution. As earlier mentioned, land governance is critically about power and the political economy of land, especially in Africa where poverty is high and the scramble for land is intense as evidenced in land conflicts across African states (Lund et al. 2006; Yamano and Deininger 2005).

## Land Tenure

As earlier noted, land is central to humans' notion of self, identity, and consciousness. It is obvious then that from discussions in the previous section, central to land governance is land tenure system. Simply, land tenure sets out the procedures and relationship, either through legal frameworks or well-defined customs or both, among individuals and groups in matters involving land. Therefore, a legal land tenure system refers to a body of state laws and rules that govern land transactions, cultivation, and use. On the other hand, customary land tenure is a set of rules and norms that govern community allocation, use, access, and transfer of land and other natural resources (Ubink 2006). The term customary land tenure speaks to the traditional method of land system, including issues of rights, access, use, transfer, and adjudication on land and other natural resources. Indigenous communities are often saddled with the responsibility of administering land and its issues in accordance with local customs, norms, and values, as opposed to state-mandated legal land tenure system introduced during the colonial period and sustained in post-independent Africa. It is an historical fact that statutory tenure system has been unable to displace indigenous tenure regimes because customary tenure system is based on community-based property systems (Wily 2000). This in turn is predicated on a shared common understanding of the relevance and enduring legacy of the customary tenure system in Africa. What has taken place over time has been a fusion or better still, a synergy between customary and statutory tenure systems. This is true in virtually all African states.

## Land Governance and Land Tenure Categorization

Land issues revolve around tenure system; hence each community, society, or state has its own land tenure system. However, there are often several interests in land as it a scarce natural resource. Therefore, land tenure is often a web of intersecting interests. These interests in land may result in different scenarios that may lead to peace or war. These interests could be divided into four parts. These include overriding interests which result when a sovereign power (e.g., a nation or community) through its powers allocates or reallocates land through coercion, expropriation, revocation, or persuasion. Complementary interests take place when there is a convergence of interest on the same parcel of land. This happens when community members possess common rights to a piece of land. Overlapping interest occurs when several individuals or parties are allocated to different rights to the same parcel of land. In this instance, an individual or party may have the right to lease land for building, and another individual or party has a different right to lease for farming. Competing interests occur when different individuals and groups contest the same interests in the same piece of land, for example, when two individuals or groups independently claim rights to exclusive use of a piece of land. Often, land disputes and litigations are the resultant effects arising from competing claims on land. This is true of land disputes in several parts of the world including Africa.

In another sense, land tenure is often categorized in such a way that makes its governance simplified with land rights holders identifiable and accountable. In the case of private land tenure, rights are assigned to individuals, a married couple, a family, or corporate entity such as a non-profit organization to possess authority over a piece of land to use as it pleases them without let or hindrance from other members of the society. Land possessed in this sense is privately owned and is used at the owners' discretion, once it is for legitimate purposes. The second category of land tenure is communal. Land use or tenure is communal when a right of common exists within a

society where a member possesses the right to use the holdings of the whole community. For instance, individual members of the community may use the land for farming or graze their cattle with the understanding of the community that such individuals have rights to the communal land. As well, the community may decide to sell, lease, or allocate the land to its members or those outside its immediate community for the common good of all. Communal land tenure is widespread and common across different countries in Africa. However, there may be differences in how each community organizes and administers its land. The third category of land tenure system in Africa is state-centric where property rights are claimed and asserted over lands within its sovereign territory. Authority over land in such instance is assigned to some public institution who is vested with state power to act and decide on land issues.

Open land tenure is often categorized as free fall all. Here, land rights are not assigned to anyone and no one can be excluded. This usually includes marine tenure where access to the high seas is generally open to anyone; it may include rivers, forests, and rangelands among others, where individuals and groups are free to access and use the resources for all. It should be noted however that a critical difference between open access and communal systems is that under a communal system, nonmembers of the community are excluded from using the common areas. State authority over land covers land sale/purchase recognition, land title deed, certificate of occupancy, land survey, and land rights. Virtually all countries in Africa practices state authority over land, whether at a central or decentralized level of government. It is often the case that private, communal, or any other type of land tenure is covered by state laws and authority over land. In most cases, open access is often covered by international laws.

## Land Governance and Land Grab

A key emerging issue in land governance in Africa has been the phenomena of land grab. While not exclusive to Africa, the trend, pattern, and effect of land grab have been more felt in the continent. From Lagos to Nairobi, Johannesburg, Maputo, and other African cities, land grab has emerged a point of focus in shaping past and present dimensions of food security, poverty alleviation, and responsible agricultural investment, all key objectives of land governance. The significance of the land grab in land governance is seen in the classification of the continent as hosting the poorest set of humans on the planet. For instance, in 2018, the World Bank rated Nigeria as the country with the highest number of poor people with extreme poverty accounting for about 87 million people (The World Bank 2018). According to the report, other African countries are not far behind, raising the issues of access to land, land rights, and land tenure system. In every society, issues of land evoke emotions and claims. In Africa, the phenomenon of land is such that generates contestations from different parties laying claims to the land. As discussed earlier in the preceding section, land issues in Africa revolve around land tenure gridlock, land right struggles, and land-induced conflicts emanating from unfavorable and unproductive land reforms. Uganda, Papua New Guinea, Kenya, South Africa, Nigeria, Congo, and Zimbabwe to mention a few are some of the countries with high incidence of land-induced crises. From the colonial era, the epicenter of land contentions are issues surrounding food security and optimum agricultural productivity that should best facilitate economic development. Such issues revolve on the rights, economic prosperity, and land ownership justification, control, distribution, and utilization. Consequently, this often led to the adoption of land reform policies channeled toward ameliorating the menace posed by old land tenure system instituted by colonial administration in different parts of Africa. The reforms and the new policies generated from these acts have often exacerbated the land contentions in many African countries. Meanwhile, new critical issues and controversies woven around inequality, deprivation, social injustice, sociocultural contexts of exclusion, and land conflicts are emerging (AU et al. 2010). So, what is land grab?

In its simplest form, land grab is the control through ownership, lease, concession, contracts, quotas, or general power of a large amount of land, whether legal or illegal, foreign or locally owned, meant for extraction, speculation, exploration, control, or commodification often of some other land users. In most cases, land grab is often geared to resource extraction and control. As well, land grab is dominated by foreign investors in post-conflict areas and where no serious agreement guides the process of land acquisition (Mabikke 2011). There are arguments for and against the issue of land grab in Africa given widespread poverty, underutilization of land, weak land governance structures, corruption, weak state institutions, the question of human rights of indigenous landowners/farmers, and the predatory nature of the average investor.

It is instructive to note that land grab or land grabbing is clearly linked to the state of underdevelopment of Africa states and land, weak land tenure system, and the long-term insecurity of land rights in Africa. Indeed, this is the prime reason why many deals have been able to go ahead in the first place, without protection of rights, or social and environmental safeguards compounded with the near absence of land governance structures. Cases in Nigeria, Kenya, South Africa, Ethiopia, Botswana, and several African countries show that emerging and current land grab acts have deep historical roots. It emanated from the colonial period, sustained in post-independence Africa, reaffirmed during the structural adjustment policies (SAP) in the 1980s that paved the way for private investments from abroad from the 1990s onward, and maintained currently through the instrumentality of globalization. As said, legal and institutional weaknesses have been exploited by the powerful (local or foreign or both) to the detriment of the less powerful, which are typified by local communities or marginalized ethnic groups across African countries.

The issue of land grab in Africa, particularly in Southern Africa, is not without the antecedence of settler's colonialism and anti-colonial struggle. It is obvious that lopsidedness in land tenure system, land rights, and land reforms has contributed to the not so subtle emergence of land grab in Africa. Land grab in Africa, no matter its justification, affects both the rural and urban, particularly the rural areas where most of the dispossession takes place under the guise of agricultural investment (Kaag and Zoomers 2014). Across Africa, most of natural/land resources have been appropriated by incidence of land grab, while little have come from such acquisition that was made in guise of responsible agricultural investment that would address Africa's food security challenges. The trend of land grab will continue given the continent's favorable biophysical resources, weak land governance structures, and lack of adequate industrialized agricultural technology and opportunity for large-scale plantations for locals when compared with other frontline states in the international system.

## Conclusion

The issue of land governance in Africa is tied up with the state of development of continent. While largely undeveloped, land governance structures like land tenure systems and land use acts have exposed the Africa's land to land speculators in the form of land grabbing. While not totally bad, land grab has resulted in land displacements and denial of human rights of locals, farmers, and other indigenous land users. The resultant effect of land grab has been to engendered land conflicts that are widespread and endemic in virtually all countries in Africa.

With the continent poor and poverty afflicted, responsible agricultural investment has been argued to be the reason why land grab should be allowed. Yet, land grab has not addressed food insecurity neither has it alleviate poverty. Increasingly, evidence is showing that land grab, whether foreign or local or both, is more about land resource exploration, exploitation, and control for maximum profit making.

As noted, the absence of land governance structure in several states is further reinforced by high level of corruption, weak state

institutions, and nonadherence to issues of fundamental human rights, particularly of local farmers and indigenous landowners. It is also instructive that land reforms have not solved many of the problems, conflicts, and crises associated with land in Africa partly based on the absence of effective land governance laws and partly on the ineffectiveness of land governance laws and structures where it exists. This is so because several African states lack the capacity to protect its lands and people from land predators and speculators. The subservient role of African states within the international system is also a factor. This has reinforced the need for a paradigm shift in land cultivation and ownership, resulting in the call for effective land governance laws and structures. On this note, it behooves on African states to formulate sound land governance policies and ensure that they weigh the cost and benefit of land deals before embarking upon them. Respect for locals or indigenous peoples' fundamental rights to land must be secured and respected. Also, land implementation process must be well monitored, transparent, and corrupt-free. Like other states in the international system, Africa cannot survive on its own. But if help must come in terms of agricultural investment, it must be based on clearly defined land governance laws and structures and mutually beneficial, facilitate development, and not dispossess Africa of its land resources.

# Language Management/Policy

Siu Yau Lee and Yang Dong
Department of Asian and Policy Studies,
The Education University of Hong Kong,
Hong Kong, China

## Synonyms

Language management; Language planning

## Definition

Rules that deliberately influence the behavior of others with respect to the acquisition, structure, or functional allocation of their language codes.

## Introduction

Language policies are rules that deliberately influence the behavior of others with respect to the acquisition, structure, or functional allocation of their language codes (Cooper 1989). In other words, language policies can be legal establishments that force the citizens to modify their language practice or covert rules that shape the values assigned by the citizens to each linguistic variety and variant (Spolsky 2012).

Language policies have significant distributive implications for their subjects because language is a crucial resource for disseminating ideas, shaping identity, and social advancement. People use language to perceive, describe, and communicate their experience (Williams 1988). Words that describe daily life and values of most members of society can be used by the state to create a sense of unity among the public and to facilitate the state's bureaucratic administration (Edelman 1977). Unsurprisingly, therefore, from the French Third Republic's cultural standardization program to the anti-Putonghua protests in southern China, language policy has been a key site of political contention. This chapter provides an overview of the major considerations in language policy making and describes the tools that are commonly used by language officials to manage language.

## Considerations in Language Policy Making

Early attempts to study language policy were largely influenced by the "Sapir-Whorf" hypothesis, according to which, in its strongest form, language *determines* thought (Sapir 1985; Whorf 1956). While today few scholars uphold this claim in its pure form, many proponents of this hypothesis still maintain that language *influences* how human beings understand reality because they respond differently to different word uses and grammatical structures, often in an unconscious manner (Geis 1987). For instance, according to Whorf, people are likely to behave more cautiously when they are around "gasoline drums" than "empty gasoline drums" – although the latter is actually more dangerous (Whorf 1956). This view was popularized by Orwell's satirical novel *Nineteen Eighty-Four*, which demonstrated that if a despotic state (the USSR) were to restrict the range of things that are expressible in language, it could also restrict the range of things that are thinkable. In fact, many scholars in this camp maintain that because language is the medium people use to perceive, describe, and communicate their experience, language policy is a useful means for a state to enact its power and establish its own normality (Lewis 1999; Galasinski 2000). Edelman (1985), for instance, famously proclaimed in a 1985 article that "political language *is* political reality." Laitin (1977), as another example, also concluded his study of Somali by arguing that the impact of certain political concepts is different when expressed in different languages, and, therefore, to change the language of a population is to change the ways the population thinks and acts politically.

The assumption that language policy influences thought has been questioned in a number of studies. Bourdieu (1991), for example, argued that authority is exogenous to language and that there are multiple sources of authority. In fact, the fall of the USSR – the regime that inspired Orwell's aforementioned novels – has concretely exemplified this fact, for if there were indeed "power" within certain linguistic formulations, the state should have been able to maintain its dominance over its subjects despite its economic failures.

Another dominant approach in the study of language policy adopts a functionalist perspective, which assumes that language is planned to solve problems (e.g., illiteracy) (Rubin and Jernudd 1971; Jernudd and Das Gupta 1971; Karam 1974; DeFrancis 1950). Some scholars in this stream have argued specifically that language policies are specific tools used by governments to tackle language and communication problems (Rubin 1973). Haugen is one of the pioneers of this approach. In 1966, he proposed that "language planning is called for wherever there are language problems. If a linguistic situation for any reason is felt to be unsatisfactory, there is room for a program of language planning" (Haugen 1966).

Therefore, for Haugen, a model that explains the formation of language policies should involve a series of technical procedures such as problem identification, grammatication, and correction (Haugen 1983).

Haugen's assertion attracts criticism from other public policy academics for neglecting the political agenda that drives the process of policy making. Sociolinguists such as Cooper have pointed out that language planning is essentially political in nature. According to Cooper, although language policies are indeed formulated partly to tackle communication problems, they are formulated often with covert agendas of the policy makers that are essentially nonlinguistic.

Blachford, Spolsky, and Grin extended the focus of language policy studies to the language beliefs of a society and the decision-making process of governments (and the consequences of such decisions) (Grin 2003). In brief, they aimed to identify a number of major organizations and stakeholders (such as the bureaucratic structure of the state (Blachford 2004), local officials, religious organizations (Spolsky 2004), families, and transnational organizations) in the process of language planning so as to explain the variations in language policies and any conflicts that take place between different linguistic communities. In the field of political science, recent scholars have followed a similar path of investigation and highlighted the relevance of a set of political factors in language management, such as the need for nation building, external threats, and systems of representation (Liu 2011).

## Types of Language Policy

Language policy is not a unitary subject. Language policies vary in form, objective, and target group. Traditionally, they can be broadly classified into three types by their mode of enforcement: corpus planning, status planning, and acquisition planning (Haugen 1966).

Corpus planning policy focuses on the creation of new forms, the modification of old forms, or the selection of alternative forms in a spoken or written code (i.e., the corpus of a language). The defining feature of this type of language policy is that it assumes there is a "correct" or "pure" form of the language that is articulated by a small group of language planners or elites (Cooper 1989). In this type of language policy, as language is managed in a top-down manner, it tends to follow a specific pattern and logic. The French purification movement developed under the court poet François de Malherbe in the 1960s is a good example of this ideal type of language policy. During the movement, obscure terms were prescribed by the state from the literary vocabulary to reflect the superior status of the elite (Cooper 1989).

Consider the case of China. Shortly after the Communist Party came into power in 1949, leaders of the state emphasized the importance of maintaining the "purity and health" of the Chinese language and published new dictionaries to codify linguistic correctness (Volland 2009; Lee 2014). The top-down nature of this language change was evident in that the state was not only asking the people to master the preexisting Chinese language but also trying to prescribe a "correct" form of language based on the judgments of the political and linguistic elites. To achieve this objective, the state launched a number of "cultural revolutions" in the 1920s and the late 1950s – such as the anti-illiteracy campaign – during which time traditional Chinese characters were considered as a symbol of the old China and as an obstacle for knowledge popularization. The central political elites needed to maintain a tight top-down control over language because this is what determined the success of the political campaigns. Using ambiguous and vague terminology would "result in the confusion of the two kinds of contradictions and the widening of the scope of attack" (Schoenhals 1993). Therefore, to control the size and direction of political campaigns, leaders of the central state also needed to control the meanings of words. A number of dictionaries, such as the *Contemporary Chinese Dictionary*, were published to define words in a way that "correctly" presented the proletarian's position, the party state's policy directions, and the principles of Marxist-Leninism (Lee 2014).

Status planning policies emphasize the status or values of a language in society (Bhatta 2006). This type of policy is not merely about the state's decisions regarding the legal status of one language in relation to another, but also about the allocation of languages or language varieties to given functions, such as civil services, education, and journalism. Unlike top-down policies, which focus primarily on the corpus of a language, incentivizing policies deal with the role that a specific language should or could play in a society. Instead of a top-down approach to defining what is the right or correct thing to say, incentivizing institutions often establish the legitimacy of a language through linking that language with certain economic benefits. By doing so, the subjects are incentivized by the state to adopt language norms. In this sense, the success of status planning does not hinge on people's reliance on the state but on their desire to obtain certain goods (e.g., social status and economic power).

An example of this is the Putonghua Proficiency Test launched by the Chinese state in 1994. This test has been promoted by the Chinese state as a career booster, especially within state organizations, the media, and schools. The impact that this promotion strategy has created is obvious: In a survey conducted by researchers at the Shanghai Putonghua Proficiency Test Centre between 2003 and 2004, 67.8% of the 2,098 respondents reported that they took the test because of job-related reasons. In contrast, only 26.9% of them took the test just to learn about their own level of language proficiency (Qiao and Zhu 2006). Clearly, the tie between the test and one's career has fueled the popularization of the test. This is particularly true when we consider the fact that the test is a prerequisite for most jobs in the Chinese government, which remains the largest employer in China.

Finally, acquisition planning policy focuses on the ways in which an individual or an entity can acquire or produce (elements of) a language. This type of policy is different from the previous two models in the sense that its focus is on the individuals who speak a language, but not on the context where a specific language should be spoken. It is more likely to exist when the elite can only defend their core interests against an increasingly "ungovernable" – stratified and checkered – society by concentrating their limited resources in selected areas. Social actors can utilize the space left by the elite to develop their own communication systems. Traditionally, this type of language policy is limited to those who are engaged with and connected to formal language teaching in schools. However, such a narrow focus on the process of formulating language rules would likely overlook some of the interactions between the governing elites and their subjects. The acquisition of language also takes place outside of classrooms in a bottom-up fashion. This is particularly important to consider in an age when the Internet has empowered ordinary citizens to formulate new terms and grammar. Consequently, governments often need to derive effective mechanisms for acquiring new languages that are generated by the netizens.

The Chinese Internet word-filtering system is a case in point. The list of prohibited words that the Chinese state maintains, in essence, defines the boundaries of communication that are deemed to be "exceptional" – in the name of obscenity or national security – and thus the language can be legitimately controlled by the state. This technique not only provides the state with flexibility to respond to the changing political environment in the Internet era but also allows it to concentrate its resources on issues that it deems more crucial – such as collective expressions of demands for political changes and justice. Table 1 summarizes the major types of language policy.

Of course, these three types of language policy are not mutually exclusive. One can often identify elements of all three types of policy in a comprehensive set of language planning schemes. However, they do not work equally well under different social and economic circumstances.

In China, status planning policy was implemented in the 1950s when the central state enjoyed a clear comparative advantage over other actors such as ordinary citizens in terms of economic resources and communication capacity. Imposing language rules from the top down is presumably the most direct way for powerful state agents to maintain their political and symbolic dominance (Schoenhals 1993). This does

**Language Management/Policy, Table 1** Major types of language policy

| | Mode of enforcement | Domain | Objectives | Examples |
|---|---|---|---|---|
| Corpus planning | Top-down | Corpus of a language | To manipulate the resources available for expression in the public sphere | Dictionary, Romanization of characters |
| Status planning | Incentivizing | Status of a language | To incentivize subjects to adopt certain kinds of linguistic behavior so as to make society functional | Language tests, legislation, civil servant recruitment exams, media regulations |
| Acquisition planning | Selective | Means of acquisition/ production of elements of a language | To control the generation of new languages/linguistic elements | Internet keyword censorship, teacher training |

not, of course, mean that compliance from the subjects was voluntary. In practice, top-down language policies are rarely popular, because they allow only a small group of elites to monopolize the power to define correctness in language. In Mao's China, intellectuals lost their freedom to use language in their own style, and the general public was prompted to adopt a mode of communication that was very different from their linguistic practice at home (Volland 2009). Despite these difficulties, the socioeconomic conditions of the time meant that resistance could only take place in a subtle manner, and people who disagreed with policy could not form a force that was sizeable enough to prompt the ambitious language planners to reconsider their demands.

The market reform that began in 1978 decentralized the distribution of economic and communication resources that had previously been controlled directly by the central state. This decentralization of economic and communication resources empowered profit-oriented publishers to challenge the state's monopoly over the definition of "prescription." This prompted the state to craft a new language policy to recapture the increasingly chaotic linguistic arena. Instead of merely defining the content of "standard language," the state made Putonghua a prerequisite for many desirable social positions. The influential Putonghua Proficiency Test that was implemented in the early 1990s is a key example of such action.

By the late 1990s, the Chinese state's dominance over economic and communication resources was once again challenged by the forces of globalization and the spread of the Internet. With the introduction of the Internet, individuals were transformed from mere recipients of messages from the elites into "publishers" who were capable of disseminating information across different sections of society. Thus, the Internet empowered diverse groups of ordinary people to become participants in the decision-making process of language management, when they had formerly been deprived of such involvement. While some ordinary members of the public exploited the opportunity to directly confront the authorities, many others used the Internet as a platform for language play. Either way, new communities and values were formed, allowing the netizens to organize themselves in ways that allowed them to bypass the state's language regulations, which eventually prompted the state to take a more open attitude toward language resources that are devised at the grassroots level. It is therefore not surprising that a more interactive language policy was formulated by the State Language Commission in the late 2000s after the state had suffered several failures in regulating "non-prescriptive" Internet language.

## Conclusion

In short, it is important to recognize that language policy is contentious and dynamic. This holds true even in authoritarian regimes such as China.

Therefore, it would be incorrect to assume, as some students of authoritarian regimes do, that language policies are necessarily formed by a top-down approach and that grassroots-level demands can become influential in shaping the state's policy direction only when state actors see those demands as beneficial to their particularistic interests (Dreyer 2003; Francis and Kamanda 2001; Hu 2007). After all, language is a crucial resource for disseminating ideas, shaping identity, and social advancement. Consequently, it is hardly surprising that intense contestation between different actors has long shaped the development of language policies.

## Synonyms

Collaborative governance; Effective governance; Governance; Latin America; Public governance

## Definition

Governance is government's ability to deliver value-added services and innovative problem solving by promoting adaptability, flexibility, and collaboration, while embracing an organizational culture that values transparency, trust, and power sharing for the pursuit of common public goals.

## Introduction: The Problem of Defining Governance

Defining governance has proven challenging. In fact, researchers claim little consensus regarding a definition of governance (Frederickson et al. 2015). However, a discussion on Latin American governance would be more fruitful if it starts with agreeing to some pragmatic and contextually bounded definition of governance. But first off, why is defining governance so challenging? The disagreement about governance as a concept intersects across several key dimensions. First, governance conceptually and in practice covers a variable and unbounded scope. Whatever we think of governance, it varies across levels of government and across regions, and surely across cultures and countries (a topic we will come back to below). Governance as it relates to local governments is very different than its counterpart manifestations at the national level and even more different than international governing bodies, such as the European Union, or the United Nations. The scope is not only different at larger levels of government, but, in many respects, it is unbounded. Where does the scope of the federal US government end vis-à-vis local and state governments? The answer, of course, is very complicated and not clearly defined – one would be wise to consider governance on an issue-by-issue basis. Second, defining governance is complicated because the nature of public governance is in a continuous mode of change. As it is the case with other concepts in the social and government realms, such as bureaucracy, democracy, and others, the meaning of contemporary governance is quite different than its meaning in the 1970s. In the 1970s, the scope of governance and therefore its meaning was more limited to an action-oriented government model; that is, a step up from a bureaucratic, reactive, and passive model to a postbureaucratic, proactive, and active model. Today, governance is all of that with the added characteristics of a networked, collaborative, creative, market-driven government model. Third, attaching the qualifier "public" to governance, as in public governance as separate from corporate governance, adds multiple layers of complexity to the definition. Public governance is foremost a politically charged compound concept. It is governing in a conflicted environment where values and political ideologies are as valid predictors of decision-making as technical, managerial factors. For example, public governance has to accommodate political considerations when allocating public resources while also paying heed to cost-benefit concerns. Four, how does one know how much governance there is in a public organization? Do we analyze the organization's structure? Do we examine its approach to decision-making? Do we assess its performance? We don't know. Measuring governance, even

operationalizing the concept, has so far proven to be a very challenging endeavor. That is partly because one needs to measure governance in the context of something else and something else frequently complicates the operationalization of the term even further. Take for instance, effective public governance. Not only are then we in need of measuring governance, but now it includes governance's effectiveness as it relates to the public sector, which has its own complexities with measuring outputs and outcomes, not to mention the need to effectively address multiple conflicting goals. Finally, and because of the factors mentioned above, a parsimonious conceptualization – a characteristic of good theorizing – has eluded all those who have tried. Take for instance, the definition offered by Lynn et al. (2000, p. 235), "regimes of laws, administrative rules, judicial rulings, and practices that constraint, prescribe, and enable government activity, where such activity is broadly defined as the production and delivery of publicly supported goods and services." Clearly, this is an ambitious definition. Its scope covers the administration, policy-making, and legal aspects of government. Because their conceptualization is too encompassing, it lacks parsimony and the ability to guide systematic research (Frederickson et al. 2015).

However, regardless of how we might end up defining governance, it gets even more multifaceted as one assesses its conceptual validity and practice within the context of Latin American government. Let's, for the sake of this discussion, assume that all countries in Latin America share an analogous culture and government model. Even if that was the case, which obviously is not, we are still left with the reality that Latin America's challenges and needs are more pronounced and wanting than in more developed societies. These acute needs or conditions further problematize the definition of governance and its practice. Let's be clear, these challenges and needs affect the establishment of effective governance in various degrees across countries in Latin America.

Governance, already a difficult endeavor because of the multiple, conflicting and increasingly complex public sector goals, is further tested by the needs and challenges distinctive to Latin America. Thus, governance is not only tasked with collaboratively addressing multiple needs, but the regimes, political culture, mores, and institutional dysfunctions characteristic of Latin America threaten to wreck any chance of success even before governance is institutionalized. The most obvious challenge has to do with the fact that most countries in Latin America have only recently begun on a path to political stabilization. Political stability ranges from very stable, as is the case of Uruguay and Cuba (Cuba's high score on this dimension could be read as the country's citizens' perceptions of its political stability regardless of its totalitarian system of government. Arguably, there is political stability in a totalitarian state.), to very unstable, as for example Venezuela and Colombia (Colombia's historical struggle with terrorism affects its citizens' perception of political stability.). The other countries in Latin America fall between these two extremes with Costa Rica, Panama, and Chile falling into somewhat stable, and Mexico and Guatemala into somewhat politically unstable (Kaufmann et al. 2011). Because governance faces greater challenges in times of political turbulence, how politically stable a country is affects its governance. Corruption is another noteworthy challenge that further complicates governance. Quite often, high levels of corruption, as is the case of Venezuela and Haiti, seem to be the norm. Cuba, Colombia, and Jamaica are ranked as somewhat less corrupt, and Uruguay, Chile, and Costa Rica score as the least corrupt countries (Kaufmann et al. 2011). Corruption, although not a paralyzing effect on governance, tends to slowly take corrosive action on the day-to-day operations to the point that the organization serves the need of those that control the organizational resources and not of those it is statutorily mandated to serve. In that sense, and continuing with the crude organic metaphor, organizations become hosts to parasitic agents feeding on the organizational resources at the detriment of citizens and other intended end users. Because of the relatively high levels of corruption, trust in government is low in Latin America, which poses yet another challenge to effective

governance. Low trust in government is the other side of the corruption coin. The two conditions are highly correlated and just make sense that it is so. Corruption involves many stakeholders including citizens, who are forced to accept a culture of bribery and corruption to get any level of service. Given that bribery is a quid pro quo for needed services, citizens understand that they cannot trust their government to do anything for them unless a bribe is paid for "public" services. Governance then, is compromised, as all effective governance models require that all stakeholders buy into a collaborative, honest, democratically responsible arrangement. One cannot expect such arrangement to flourish if some few citizens and businesses are getting the lion's share out of government services only because they have established agreements with corrupt public employees and leaders based on their ability to pay. Another closely related condition, which challenges governance, has to do with the ineffective rule of law that still permeates most Latin American countries. Rule of law countries ranges from effective rule of law in Chile, Uruguay, and Costa Rica to ineffective rule of law in Venezuela, Haiti, and Bolivia. Most countries fall into a position between these two extremes with Panama and Brazil, falling closer to effective rule of law, and Cuba, Colombia, and Jamaica closely approaching ineffective rule of law (Kaufmann et al. 2011). Effective rule of law is demonstrated by societies that ensure citizens' rights are protected and advanced. Government, its officials, and even private entities are held accountable to the citizenry through a transparent, uniformly applied system of laws and regulations. It promotes a fair and equitable law-making and law enforcement system. Those features or dimensions of effective rule of law allow for the institutionalization and nurturing of governance. Clearly then governance is compromised and rendered dysfunctional by the country's inability to establish an effective rule of law system.

Lastly, governance is greatly challenged by low levels of democracy. The Latin American region was clearly proauthoritarian military regimes before the 1970s. Even though Latin America had fluctuated from authoritarian back to democratic regimes throughout its history, "a burst of democratization from 1978 to 1992" turned it into a predominantly democratic region (Mainwaring and Scully 2010, p. 3). A return to democratization in Latin American began with transitions to democratic governments in the Dominican Republic, Ecuador, and Peru in the late 1970s, but the region has not succeeded in installing full democracies across all countries. Mainwaring and Scully (2010, p. 3) describe this condition as, "[m]any regimes in Latin America are semi-democratic rather than full democracies because of limits to freedom, poor ability to protect human rights, or lack of civilian control of the military." What is also true is that level of democracy varies widely across countries with Uruguay and Costa Rica as the most democratic countries, and Haiti and Cuba as the least democratic nations. Chile, Panama, Argentina, and Dominican Republic closely follow the most democratic countries, but Paraguay, Colombia, and Guatemala line up closer to the least democratic countries (Mainwaring et al. 2010). Undemocratic political regimes complicate governance by their inability to control military and other nonelected actors' intrusion into the peaceful and consensus-building action of the citizenry, bureaucracy, and elected officials. Undemocratic political regimes that hinder free and popular voting, freedom of speech, and freedom of assembly, and interfere with the establishment and promotion of political rights and civil liberties make it all but impossible for an effective form of governance to take hold. All said, countries that exhibit high levels of democracy could be said to offer effective governance the highest probability of success while the opposite is true in countries, which exhibit low levels of democracy.

The challenges discussed above pose significant barriers to the establishment of a unified definition of governance. But should we expect a universal definition? Even a cursory review of the literature would convince researchers of the unfruitful pursue of a search for such universal definition. That is not to say that we should not attempt to advance a working conceptual definition of governance premised on the pragmatic assumption that a working definition limited to

some identified context is better than not having one at all. The following working and practical definition is advanced if only as a useful, interim analytical criterion to assess the state of governance in Latin America. Governance is government's ability to deliver value-added services and innovative problem solving by promoting adaptability, flexibility, and collaboration, while embracing an organizational culture that values transparency, trust, and power sharing for the pursuit of common public goals.

Effective governance is suspicious of constraining hierarchical arrangements, bureaucratic organizational morass, red tape, and closed system thinking. Instead, it involves a networked arrangement featuring multiple centers of power allowing for unrestricted exchange of ideas, sharing of resources, and collective decision on innovative problem-solving endeavors. Furthermore, effective governance depends to a great degree on the willing collaboration of decision-making actors across the nonprofit and private sectors. Governance exploits the blurring lines among the public, nonprofit, and private sectors to engage all actors in a collaborative, power-sharing arrangement for the pursuit of the public interest.

Governance thus defined depends to a great degree on welcoming, encouraging political, governmental, and civil society conditions. Given Latin America's civil society and political conditions, what is the state of governance in the region? How well does the proposed definition applies to countries in the region? The short answer is that it varies across countries in Latin America, and in some cases, the status of governance is disheartening while in a few cases governance seems promising. In fact, one can fairly argue that its development varies considerably across countries in the region and that there is a close correlation between effective governance and the extent to which countries have developed democratic institutions and rule of law systems while maintaining political stability, low levels of corruption, and high levels of trust in government.

Cuba is the most obvious example that undemocratic government devastatingly undermines effective governance. It seems reasonable to argue that searching for even trace manifestations of effective governance is fruitless in the absence of a framing democratic government. Haiti's generally inchoate democratic government is too politically unpredictable and lacks a proven rule of law system – which results in high levels of corruption and no trust in government – to shore up and promote efforts to establish effective governance. The challenge for Haiti is then to deepen its democratic government and stabilize its political system so that governance can begin to take root and succeed across its public and nonprofit sectors. Guatemala, Paraguay, and Nicaragua are one step removed from the extreme cases represented by Haiti and Cuba. These set of countries have made some advances on democratic governance and rule of law and even some progress on either political stability, corruption, or trust in government. While the countries have made some progress, such advances are still early in their development and therefore effective governance is in its incipient stages. Mexico, Peru, and Brazil are countries somewhere in the middle from absence of governance to fully developed effective governance. These set of countries have budding democratic and rule of law systems and have made some progress in two or more dimensions found to help effective governance – political stability, trust in government, and low levels of corruption. These countries have made progress from an incipient phase, but their governance is still in a dysfunctional stage. Panama, Argentina, and Dominican Republic have progressed to a functional governance stage. That is, these set of countries have established democracies and strong rule of law, which result in fairly advanced systems of trust in government, low levels of corruption, and politically stable systems. In contrast, Chile, Costa Rica, and Uruguay have reached a fully effective governance stage. They have fully established democracies, deep-seated rule of law, highly stable political systems, high levels of trust in government, and low levels of corruption.

The rough ranking shown above is based on reports by Mainwaring et al. (2010, p. 40), and Kaufmann et al. (2011) on the dimensions of governance previously discussed. It is not meant

to offer a sort of operationalization or measure of effective governance in Latin America. It is merely an attempt to illustrate the high variability of the concept and how it might correlate with commonly measured – albeit not universally agreed upon – related concepts, such as the level of democratization, rule of law, political stability, trust in government, and levels of government corruption. More important and notwithstanding its acknowledged variability, are there any characteristics common to governance across Latin America countries? The short answer is yes and those common characteristics include the following. Latin American governance is not collaborative. That is, governance across Latin American countries has not generally taken advantage of collaborative networks across the public, private, and nonprofit sectors. Collaborative governance seem to involve public-private sector partnerships for advancing economic development and to foster innovation. It focuses on the idea that the private sector is less bureaucratic and therefore more innovating than the public sector. It, therefore, assumes that the public sector would benefit from partnering with the private sector in seeking solutions to governance problems. Furthermore, it assumes that public sector organizations should reform until their organizational structures and decision-making processes follow business principles. Lost in this line of thinking is the idea that governance could involve a leadership style, organizational culture, and democratic ethic that advance public interest concerns collaboratively with the private and nonprofit sectors – that is, the founding idea that public governance is first and foremost the responsible democratic doing of government.

Somewhat related to the above is the idea that the definition of governance in Latin America is highly influenced by the corporatist conception of donor countries. It is a definition driven by international donors' concern with foreign aid effectiveness. It follows a corporate governance approach and aligns itself closely with New Public Management and business principles at the detriment of the public interest and concern with citizens' needs. The definition of governance along the lines of development is exogenous to administrative capacity and, more importantly, it is devoid of responsible, equitable, democratic concerns.

Latin America governance is not sufficiently innovative in part because it still depends on highly hierarchical structures and it is rule driven. It also, by and large, adheres to a silo mentality in which specialization and organizational fiefdoms are fiercely protected. Power is therefore concentrated and the conception of power is unchanging – those in power don't see the benefit of delegating it. Governance actors do not take full advantage of the inevitably twenty-first century forces blurring the jurisdictional line among the public, private, and nonprofit sectors. The blurring of the jurisdictional lines is seen as impediments to governance instead of challenges and opportunities for innovation and effective change. To sum up, Latin America governance is not sufficiently collaborative and innovative in designing democratically responsible solutions to complex twenty-first century problems.

## Conclusion

The object of this essay was to discuss Latin American governance. Among the several interrelated factors challenging agreement on a definition of governance, this essay discussed its variable and unbounded scope, its changing nature, the "publicness" of governance, the difficulty of operationalizing the concept, its lack of parsimony, and, most importantly, various Latin American characteristics that further problematize the definition of governance. Such Latin American characteristics include unstable political systems; relatively high levels of political corruption; low levels of trust in government; ineffective rule of law; and generally low levels of democracy.

Recognizing the difficulty of an agreed-upon definition, a pragmatic and contextually bounded definition was advanced to facilitate the discussion on Latin American governance. Governance is government's ability to deliver value-added services and innovative problem solving by promoting adaptability, flexibility, and collaboration, while embracing an organizational culture that

values transparency, trust, and power sharing for the pursuit of common public goals.

The proposed definition seems to apply in various ways across countries in the region. In some cases, the status of governance is disheartening while in a few cases governance seems promising. In fact, one can fairly argue that its development varies considerably across countries in the region and that there is a close correlation between effective governance and the extent to which countries have developed their democratic government and rule of law systems while maintaining political stability, low levels of corruption, and high levels of trust in government.

Cuba and Haiti are the most obvious example that undemocratic government devastatingly undermines effective governance. Their politically unpredictable systems and weak rule of law systems are barriers to effective governance. In contrast, Chile, Costa Rica, and Uruguay have reached a fully effective governance stage. They have fully established democracies, deep-seated rule of law systems, highly stable political systems, high levels of trust in government, and low levels of corruption. Between these two extremes, the other countries in the region have made some advances and are either close to a full governance stage or less dysfunctional than Cuba and Haiti.

Common to governance across countries in the region is that governance is not collaborative. Latin American countries governance has generally not taken advantage of collaborative networks across the public, private, and nonprofit sectors. Instead collaborative governance seems to involve public-private sector partnerships for advancing economic development and for fostering innovation. It focuses on the idea that the private sector is more innovating and effective than the public sector and therefore public sector reform should follow business principles. Donor countries concerned with the efficient use of foreign aid drive the concept of governance in Latin America as closely aligned with corporate governance, New Public Management concerns, and business principles at the detriment of responsible, equitable, democratic concerns.

Latin America governance is not sufficiently collaborative and innovative in designing democratically responsible solutions to complex twenty-first century problems in part because it still depends on highly hierarchical structures and it is rule driven. Power is concentrated and the conception of power is unchanging – those in power don't see the benefit of delegating it. Twenty-first century forces blurring the jurisdictional line among the public, private, and nonprofit sectors are seen as challenges and not opportunities, which misses opportunities for innovation and effective change.

Ethics is an internal set of moral codes, or an individual moral compass, used to guide behavior and decision making.

## Introduction

Ethics can be loosely defined as doing the right thing when no one is watching. Ethics is an internal set of moral codes, or an individual moral compass, used to guide behavior and decision making. While each individual may have a slightly different appetite for what they consider to be right or wrong, a universal degree of correctness is typically accepted.

However, the general public may hold certain individuals to a higher level of ethical behavior. For example, the decisions made by doctors, lawyers, and civil servants can be critical and have long-lasting, life-or-death ramifications. The standards are set higher for people in these occupations, and any type of corruption or inequity will not be tolerated. Over the years, legislative acts, regulations, and administrative agencies have been created to enforce ethical behavior and hold professionals accountable when standards are violated. It is this journey, ethical development in public administration, that will be highlighted in this chapter.

Hiring, developing, and maintaining an educated and politically neutral workforce have been the mission of the civil service system since the late nineteenth and early twentieth centuries. Separating appointed officials and politics was supported both in literature and in practice; however, the appropriate level of division is still deliberated. To that end, over the years, boards, commissions, and organizations charged with professionalizing the civil service have been created, dissolved, and created anew. Insulating employees from the political quagmire, establishing fair and equitable hiring processes, and identifying conflicts of interest were at the heart of each manifestation. While each organizational reincarnation continued to reinforce the reform efforts by addressing corruption, an argument can be made that the creation of a set of public sector ethics standards and behavior was another thread quietly working toward the same goal.

This chapter will begin with a brief review of civil service reform efforts and the politics-administration dichotomy covered in the Hiring Regulations of Public Administration chapter. From there, it will present an argument for the presence of ethics in not only the field of public administration but public service in general. The chapter will then examine the evolution of the ethics discussion in practice and highlight how research on public administration ethics has been distilled to two general schools of thought. The chapter will conclude by reflecting on the current state of ethics and forecasting what challenges the future may hold for ethics in public administration.

## Civil Service Reform

New York Senator William Marcy is credited with the phrase "to the victor belong the spoils." This statement was said in response to criticisms of patronage resulting from President Jackson's effort to remove hundreds of federal employees and replace them with campaign loyalists. Whatever the original intent of Marcy's words, they were unfortunately reduced to a negative association with political corruption and cronyism, and Jackson's behavior marked the beginning of the spoils system.

After the Civil War, the government expanded into new and diverse service areas, the citizenry was demanding more professional and qualified representation, and individuals became more educated and interested in working in the public sector. This perfect storm, backed by research from a new discipline of literature, motivated officials to make sweeping changes to the civil service. In 1883, the Congress passed the Pendleton Act which established a Civil Service Commission charged with developing mechanisms to ensure fair competition for government jobs. In 1978, the Carter Administration passed the Civil Service Reform Act which revamped the entire personnel

system, and, while it has been modified over the years, it is still the model for the federal government. The field of study, public administration, focused on the need to separate politics from day-to-day administrative responsibilities. Scholars and practitioners alike agree that the two should maintain a distance in order to promote a professional and neutral workforce, but the level of appropriate interaction is still debated in classrooms today.

## An Argument for Ethics

Over the years, many professions have adopted codes of ethics. Among them, the medical, legal, and educational fields have all implemented standards of conduct that indicate how individuals are expected to behave. Some, such as the political and law enforcement fields, also require people to also take an oath of office to further affirm their commitment to uphold the desired behavior.

Some theories do not define what ethics are, but rather what they are not. They hold that ethics are not simply the vague, "feel-good" exhortations about an undefined public interest nor are they simply the general ethical principles that typically guide personal, moral choices (Goss 1996). This position does not support the notion that professional ethics are built upon universal, generally accepted ethical principles. Instead, this theory is in line with Machiavelli who promoted moral convictions in politics because they were necessary to maintain stability and peace, but also believed two sets of morals were appropriate, one for the ruler and one for masses. Similarly, Goss maintains more of a moral relativism in that ethics can vary depending on profession, background, culture, and past experiences. An argument can be made that based on this philosophy, a person's history will lead them to a profession that espouses familiar ethical behavior further perpetuating ethical relativity and the lack of a concrete definition of ethics. This position could further be argued that because each profession is committed to its own set of morals, the tolerance for certain types of behavior is higher than that which is accepted by the general public.

While each individual profession may have its own set of principles and limitations, other scholars believe that ethics of all fields are generally built upon a universal ability to distinguish good from evil, propriety from impropriety, and the view that people should do what is right and not do what is wrong (Josephson 1989). Here, public officials are held to higher standards, not against other professions, although their decisions can and do affect other fields, but against ordinary persons and the general public.

For example, although public employees do not work directly with life-or-death issues, they are expected to serve the people and make decisions in the best interest of the citizenry. It is these decisions that very well may impact *how* a person lives and the decisions that are made up to, and after, their death. Here, people see public officials as being entrusted to be the guardians of resources and represent the public by exhibiting the highest of *universal* morals. And, in a time when someone's lapse in judgment is instantly available for public consumption, citizens are holding leaders to increasingly higher standards and judging them against collective ethical norms and not necessarily against the values of that profession.

Case after case of political misconduct can be cited, and there is no shortage of examples demonstrating a lack of moral virtues in the public sector. Just a quick scan of the Internet or watching one night of the evening news will show politicians and civil servants alike involved in scandals related to email communication, electronic data theft, sex, fraud, conspiracy, and money laundering. The presence of unethical behavior is not a recent development. Attempts to reduce political corruption have been staples in American government for hundreds of years. Woodrow Wilson and the civil service reform efforts began the fight to professionalize government in the 1800s when the patronage system was rampant. In 1978, after the Watergate embarrassment and resignations of several key staff members in the Nixon Administration, the Ethics in Government Act was passed (5 usc App 4). The Act established rules for former employees including a description of prohibited activities, guidelines on the proper use of information gained

during their tenure, and limits on charges for speeches and other appearances. It also authorized the attorney general to bring civil action against anyone who violates the provisions in the Act. Lastly, it created the US Office of Government Ethics which was charged with issuing rules and regulations about ethical conduct, providing training in ethics, and monitoring ethics policies in organizations (5 USCS 101). Like other federal initiatives, the acceptance and implementation of ethics regulations spread to the states and municipalities in varying degrees.

It was also in the 1970s that universities begin to attack corruption from yet another direction. By introducing government ethics courses into the public administration curriculum, students were becoming more prepared for the challenges and temptations of life in public service. Then, even on the heels of the Ethics in Government Act, it took another 20 years for the ethics teachings to get serious attention in the public administration profession (Goss 1996; Frederickson 1993). Even now, with advanced education, codes, oaths, and standards in place, officials still stray off course.

Ironically, some point to the very dichotomy that was at the heart of reform in the 1800s as one of the reasons for the need for continued emphasis on ethics and associated regulations. Through the years, hiring organizations, merit systems, and employee review policies have been put in place to keep public administrators insulated from politics and the influence of corrupt political practices. Initially, the role of the administrator was designed to be unbiased and to execute political policy with impartial professionalism. Now, because administrators are armed with a plethora of technical knowledge and have become trusted political advisors, their responsibility has grown to include policy-making. This shift contradicts the core mission of political neutrality because in order to make policy, the administrator must be an advocate for policy. Being a policy champion immediately prejudices the administrator and smacks the potential for corruption. It is for these reasons that establishing a set of ethical codes, and holding officials accountable for their behavior, is critical for faithful service to, and professional representation of, the public.

## Ethics in Practice and in Theory

As in many professions, the official association of that field creates, maintains, and enforces their code of ethics. For example, the American Bar Association has a Committee on Ethics and Professional Responsibility charged with the development of national ethics standards for lawyers and judges (www.americanbar.org/groups). In order to advance ethics reform in practice for those in the field of public administration, the American Society for Public Administration (ASPA) has been committed to attracting, developing, and maintaining an ethical workforce since the early 1980s. As an organization, the ASPA "affirms its responsibility to develop the spirit of responsible professionalism within its membership and to increase awareness and commitment to ethical principles and standards among all those who work in public service in all sectors" (www.aspanet.org). The National Council of the ASPA developed a set of moral principles in 1981 and then approved a Code of Ethics for its members in 1984. The Code is regularly reviewed and was last updated in 2013. This most recent version lists the following eight principles that members are expected to follow: to advance the public interest, to uphold the Constitution and the law, to promote democratic participation, to strengthen social equity, to fully inform and advise, to demonstrate personal integrity, to promote ethical organizations, and to advance professional excellence. And in order to further demonstrate support for this mission, the first goal in the ASPA's current strategic plan is to "advocate strong, effective and ethical public governance" (www.aspanet.org).

The literature has contributed to the practical application of the ethics movement as well. Since the 1970s, scholars have made efforts to produce guidelines for professional behavior, clarify duties and responsibilities of public servants grounded in theory, teach general administrative ethics, and continue the call for accountability. The field of research does suggest ethics for public administration can be distilled into the two broad categories of a bureaucratic paradigm and a democratic paradigm.

The bureaucratic paradigm focuses more on individual values, respect for the administrative process, and deference to the roles identified in the politics-administration dichotomy. Specifically, this tenet includes values such as accountability, professional competence, impartiality, integrity, consistency, and neutrality (Goss 1996). The democratic paradigm stresses larger, theoretical beliefs typically associated with the field of public administration such as serving as advocates, applying administrative discretion to advance principles in the public interest, being innovative problem solvers, seeking fairness and equity, encouraging citizen participation, and remaining faithful to professional obligations (Goss 1996).

Both paradigms draw on moral responsibilities and ethical judgments; however, their application is different. One paradigm clearly identifies individual characteristics and universally accepted ethics, while the other focuses more on conceptual principles of the field that would not apply to the general population. Research has shown that the public rejects the Machiavelli notion of two sets of morals and favors ethics espoused in the bureaucratic ethos model (Goss 1996). Citizens would rather be represented by individuals that value common, widely accepted ethics. Having public officials that subscribe to loosely defined professional concepts that are not in line with the general public, and morals to which the public cannot relate, makes it more difficult to trust and hold them accountable.

## Conclusion

The need to hold public officials accountable has been ongoing since the first patronage job was granted in the 1800s. By providing them guidelines for acceptable behavior, civil servants have been given the opportunity to succeed and be trusted by the people they serve. Research has shown that the general public prefers officials to practice universal ethical principles instead of conceptual ideas that do not apply to everyday life of the common person. The previous 200 years have witnessed the evolution of organizations, laws, and codes all with the goal of enforcing ethical behavior. Even with defined ethical parameters and legal consequences for straying, public servants have still found ways to skirt the rules and violate the public trust. The next 200 years will see technological advancements, possible organizational changes, and political opportunities that will continue to challenge the moral fiber of those in the public administration field. By presenting a unified front and addressing these challenges in college, reinforcing behavioral expectations by the professional associations, and enforcing accountability through legal means, tomorrow's civil servants may be better prepared to remain steadfast to a core set of ethics.

# Law and Public Administration Innovation

Amanda Swartzendruber
Illinois State University, Normal, IL, USA

## Synonyms

Change; Improvement

## Definition

Public administration innovation is a creative idea which is successfully implemented to solve a pressing public problem.

## Introduction

Public administration in the United States continues to progress toward ambitions espoused in private industry such as efficiency, productivity, and even customer satisfaction. Consequently, administrators work to implement innovation within the existing framework of law. When Congress creates regulatory programs, they are assigned to an executive department or regulatory agency which is staffed with both experts and political appointees. This format allows experts to apply their knowledge to regulatory problems with some protection from politics as the appointees serve staggered terms. These agencies may also make rules and policy related to the regulation. And, in terms of enforcement, they may investigate, adjudicate, and levy sanctions. In essence, administrative law regulates the operation of government agencies. Therefore, it has profound implications in terms of either promoting or stymieing innovation.

## Administrative Law

Administrative law is defined as that which governs organizations and the functions of government agencies and how their actions are reviewed by the court. Federal administrative law governs agencies like Health and Human Services and the IRS. States have their own version of administrative law governance. Administrative law determines the way power transfers from Congress to the administrative agencies. It also encompasses the ways agencies use their power and how the courts view their procedures (Warren 2004). Laws are deliberately written imprecisely so that a majority will support the legislation. Then responsibility is delegated to the agencies to handle the details of enacting the law. The federal government sets minimum standards, and states may further regulate as long as their standards are at least as strong. Most agencies are designed to carry out government policy through regulation and restriction; service agencies instead deliver a government program directly to the citizens.

## Innovation in Public Administration

The definition of innovation in public administration is basically a creative idea which is successfully implemented to solve a pressing public problem. The actual innovation of any procedure in government requires Congress, agencies, and the public to cooperate. There are many types of innovations: Service innovation refers to either an improvement to a public service or product or a new product altogether (Windrum 2008). Service delivery innovation or process innovation is defined as improving or providing new methods to provide public goods or services (Windrum 2008). Organizational innovation takes place when the changes are made within the agencies that provide the goods or services (Windrum 2008). This includes new standard operating procedure or management methods. Conceptual innovation refers to a change in political will which affects a myriad of procedures within public administration and can even involve new forms of governance (Windrum 2008; Walker 2002). For example, the move toward utilizing private sector organizational methods in public administration could be considered a conceptual innovation. Policy innovations fall into two categories: First they can be small and occur over a long period of time. Second, they are rapidly spurred on by those in government and conceptual innovation (Windrum 2008). Systemic innovation refers to changes in how public and private industries work together to facilitate provision of goods and services to the public (Windrum 2008). Institutional innovations refer to either the update of or the creation of new institutions (Windrum 2008; Walker 2002). Other areas of innovation can include human resource development, management, information and communication, and technology (Walker 2002).

If the goal of Congress is to encourage innovation in public administration, they possess a myriad of means to influence the agencies' actions. They may create legislation that includes procedural guidelines that can encourage change. They may make appropriations to provide funding for innovation or investigate the agency's activities to stop it. These influences are fine if done on behalf

of constituents and without any unethical behavior. Conflicts of interest do occur. An example of this could be a politician investigating an agency for attempting to regulate an industry that he is somehow beholden to.

Why should government innovate? First, national values change over time, and this affects the types of services and products required. Only in the 1960s did the public begin to acknowledge a need for public preschool programs. Then in 1965 President Johnson started Head Start as a summer test program (Zigler and Muenchow 1992). Our government went from providing no preschool programs to now serving almost a million children a year in some sort of state preschool program (Zigler and Muenchow 1992). There is an eternal need to provide more services to more people with fewer resources. Innovation often entails some form of cost-saving measures. Sometimes the actual roles and functions of government change; for example, privatization requires innovation. It sometimes saves money to contract out a service. Yet there is still a need for regulation in the entity – a private prison, for example – but how much and who should be responsible?

The need to make agencies accountable, responsive to the will of the people, and effective at communication to the public also requires innovation. Transparency is a public demand, and the advent of the Internet enhances both the ability to disseminate good information and bad. Using technology to advance innovation requires a lot of cooperation and constant training, as well as changing how one forms the communication. For example, the character restraints of Twitter and the image focus of Instagram require savvy crafting of messages – proficiency with social media is a new innovation in itself. Environmental changes such as an aging population or rapid population growth require a response from government. How does a community attract younger people while still catering to the needs of its aging constituents? Resource availability issues such as the water shortage in California or the water crisis in Flint, Michigan, are further examples.

The need to respond more adequately to citizens' calls for greater participation also requires innovation. Should the village board live stream meetings? Should constituents be able to Skype public comments? Sometimes a technological advancement demands an innovation in public administration. There is always a need to demonstrate a tangible impact in improving people's quality of life. Effective partnerships between the public, private, and civil sectors need to exist. And agencies must ensure they are socially, economically, and environmentally sustainable.

One example of a successfully implemented conceptual public administration innovation is what is often referred to as the multiuse courthouse first described by Fred Sanders at the Pound Conference, a discussion of issues in public administration by the nations' most respected scholars. Sanders originally referred to these as comprehensive justice centers where one could find alternative dispute resolution options such as mediation, arbitration, or negotiation (Sanders 2005). There was a need to reduce the workload of the courts as well as offer lower-cost, less adversarial methods of conflict resolution to communities nationally. First, Sanders explained his idea at the conference. After President Carter was elected, he appointed Attorney General Bell. Bell had attended the conference and commented on Sander's paper embracing this idea. He created a division in the Department of Justice called the Office for Improvements in the Administration of Justice. Leaders from the Pound Conference who came from academia and government created a task force to follow up on ideas to implement, and Bell headed it (Sanders 2005). Then the American Bar Association liked the idea and created what is known as its Section of Dispute Resolution which now has over 17,000 members. State and federal legislation has been passed to support this use of alternative dispute resolution, and several states actually require attorneys to discuss all available options before litigation. This requires attorneys to be educated. Academia responded by offering education in alternative dispute resolution. The ABA set up a pilot project to test the multiuse courthouse in Oklahoma, Texas, and Washington DC (Sanders 2005). They found it was essential to communicate best practices and teachable moments (Sanders 2005). The program has to adapt to its environment – it is not just

transferrable (Sanders 2005). Now these centers exist in multiple iterations all over the United States and have even been implemented internationally.

## Administrative Law and Innovation in Public Administration

Administrative law clearly affects the service and service delivery innovations as well as organizational innovation. For a new product to be provided to the public, health insurance, for example, legislation has to come and in this case would be handled by the Department of Health and Human Services. From there, procedures are created, websites are built, and experts are trained to help the public with the new procedure. The agency has to organize to handle issues with service delivery, staff call centers for public questions, enact audit procedures to ensure their service quality, and so on. Many members of Congress opposed the Affordable Care Act that created this innovation in provision of a public good. They may create laws to affect it and there have in fact been several attempts to repeal it. The agencies then must also work to improve the public perception of the service while dealing with glitches in its provision.

A public administrator must work within the law, be knowledgeable and up to date, as well as know what violates current law and the constitution. A public administrator also assists in making and enacting laws. Because the state's scope of work is ever growing, public administrators have been given some freedom in how they implement policy. To be clear, public administration is not the law; however, a public administrator has a lot of flexibility in terms of how he/she interprets and shapes the law. Public managers have the opportunity to improve public good service delivery to citizens by using rulemaking, administrative adjudication, and interjurisdictional agreements and contracts. These leaders tend to have partnerships in the communities and can create a coalition to support new programs. This allows them to advocate for policy changes because of their knowledge and legitimacy in the community.

There is always a will to integrate services to save resources. For example, an individual who delivers meals to shut-ins can be trained to assess their well-being thereby reducing the workload of an ombudsman or social worker. By the same token, as certain technologies improve, there is also a need to decentralize service delivery. Any changes to the day-to-day services and goods delivered or their delivery systems can cause tension. By utilizing partnerships in the community, leaders can encourage acceptance to change by trickling down their message. Engaging the citizens is essential for implementation of any type of innovation to be successful. It is important to start with citizen engagement right away and utilize all the new technologies including social media to build strong support. If there are bumps in implementation, this good will gained from open communication can help with frustrations.

## Conclusion

Effective implantation of innovations in public administration must have excellent management. Changes must be embraced at the top to be successful. There must be capacity to pace the innovation appropriately – there should be smaller tests before rolling a new procedure or product out to everyone so that kinks can be worked out in advance. The public must also believe in the virtues of the innovation – government has to effectively communicate why it is making a change both to those handling that change and their customers, in this case citizens. People need the tools to effectively do their jobs – management must identify and provide technical skills needed. Lastly, performance has to be measured so that processes may be improved and those improvements may be sustained.

# Law and Public Administrator's Commitment

William Hatcher and Shannon Cooper
Department of Political Science, Augusta University, Augusta, GA, USA

## Synonyms

Accountability; Constitutional competence; Constitutional or legal framework

## Definition

The responsibility of bureaucrats to follow the constitutional and legal framework of their nation. Professional standards and democratic values hold that public administrators should be concerned with fairness in administration and ethics in their duties. Commitment to the law does not allow public administrators to disregard ethics in their administrative decisions.

## Introduction: Democratic Accountability, Bureaucratic Accountability, and Political Accountability

Defining a public administrator's commitment to the law requires explaining three forms of accountability. *Democratic accountability* is the public administrator's responsibility to follow democratic values, such as constitutionally protected freedoms and rights. Public administrators have a responsible to ensure fairness in administrative practices of government. Second, *bureaucratic accountability* is the public administrator's responsibility to follow evidence-based techniques in their duties along with the norms and values of their professional, which call for public administrators to promote efficiency, effectiveness, but also fairness in administration. The demands of bureaucratic accountability and democratic accountability may at times conflict with *political accountability*, or the wishes and edicts of political officials.

The public administrator's first commitment is to follow the legal framework of their nation. The public administrator's commitment to the law does not necessarily mean that she follows the political wishes of her superior. In the United States (U.S.), public administrators have a duty to first follow the Constitution. Accordingly, the public administrator's commitment to the law is rooted in constitutional principles. This commitment may be ambiguous. Such administrative challenges demonstrate why Woodrow Wilson wrote that it may be more difficult to "run a constitution" than create one. The public administrator working in the modern administrative state will be faced with decisions that challenge her commitment to the law. John Rohr (1986) argued that the modern administrative state in the U.S. has evolved to meet the demands of the Constitution and society. As actors in the modern administrative state, public administrators have the commitment to follow constitutional principles, even though at times those actions may be in conflict with decisions of political superiors. In fact, the U.S. Supreme Court has held that public officials may be held personally libel for violating the constitutional rights of citizens (Rosenbloom et al. 2004).

The public administrator often may be faced with a situation where she has to consider bureaucratic accountability, democratic accountability, and ethics in ensure that her professional actions confirm to a nation's constitutional system. In the following paragraphs, the public administrator's commitment to the law is discussed by examining the commitment of bureaucrats to professional responsibilities (bureaucratic accountability) along with the public good and ethics (democratic accountability). Special attention is paid to how commitment to the law may go against the public administrator's commitment to political superiors (political accountability). The discussion concludes by providing practical guidance for public administrators to understand their commitment to the law.

## Professional Responsibilities of Public Administrators

Professionalism in public administration dictates rational decision-making. Max Weber viewed rational bureaucracy as a positive force in society because governments dominated by technocrats are more like to be efficient and effective than governments dominated by charismatic leaders. Today, professionalism in the bureaucracy is more likely to ensure the protection of democratic governance and the concept of fairness than unprofessional bureaucracies beholden to politics and not a commitment to the law. Ideally, law should be the product of rational debate, but in politics this at times may not the case. In democracies, public administrators are faced with the challenge of dealing with situations where the law may conflict with the goals of democratic administration—efficiency, effectiveness, and fairness. In these administrative situations, what is the public administrator's commitment to the law?

In a democracy, public managers who use public law as a guidance stand a greater chance of enhancing democratic values such as accountability (Christensen and Nicholson-Crotty 2011). As noted, since the 1970s, the U.S. Supreme Court has ruled that public administrators are personally responsible for their actions that violate the constitutional rates of individuals (Rosenbloom et al. 2004). Given this degree of personal liability, public administrators should strive to be knowledgeable about the legal rights of the citizens.

## The Public Good and the Ethics of Dissent

Public administrators are often said to have a commitment to the "public good." Such a commitment is related to the public administrator's commitment to the law. However, the concept of the public good is difficult to operationalize. In a democracy, the public good is often viewed as what the public wants from government. But the public's opinion on a number of issues differ from survey to survey. Additionally, public managers view their jobs as serving the perceived clientele of their organizations. Research on public managers has found that they tend to serve their organization's stakeholders rather than the general public. Public administrators view the public good as serving the clients of their agencies. For instance, in a limited student surveying a handful of top executives in the U.S. federal bureaucracy, the managers discussed their responsiveness to their client groups over the general public (Friedman et al. 1966). Given that institutional practices push public administrators to focus on their client groups, there is an overall need for legal accountability for bureaucracies to be rational.

The public administrator's commitment to the law becomes ambiguous when the law, policy, or behavior of a political official counteracts constitutional requirements or ethical determinants. In such situations, it can be argued that the public administrator has a duty to dissent. Public administration scholars have analyzed the effects of organizational dissent or what has been termed "guerrilla government" (O'Leary 2013). The field of public administration needs to provide answers for when guerrilla government is appropriate and does not violate the public administrator's commitment to the law.

In *The Ethics of Dissent,* O'Leary (2013) used three theoretical lenses to explain the concept of guerrilla government and provide administrative guidance for practitioners. First, O'Leary used the bureaucratic politics literature to explain how bureaucracies are political organizations, where

even merit-based employees make political decisions and cannot be truly apolitical. Public administrators hold the expertise on policy and are the actors with the closest connections with the groups that are being served by a public program. Such situations call for public administrators to be given and practice discretion in their daily work. Public administrators should practice guerrilla government when there is a strong conflict with constitutional principles. Second, the literature on organizations and management is used to explain how democratic political systems are open ones where policy is made and implemented through networks of public, nonprofit, and private firms. In such systems, the connection from policymakers to implementers is not clear. Lastly, ethics in government can be used as a guide to understand guerrilla government and the public administrator's commitment to the law.

In public agencies, according to Dwight Waldo's (1980) "Twelve Ethical Obligations," public mangers find themselves at the center of a battle between self, law, religion, public interest, and organizational norms (O'Leary 2013). Generally, ethics is defined as the study of values and how one deciphers what is right and what is wrong (O'Leary 2013; Rohr 1989). But as O'Leary argued, ethics is being able to knowing what is right or wrong and also doing right. Thus, guerrilla government should be employed when the public administrator has to decide between following political instructions and the legal framework governing her organization. In such situations, ethics, professional, and commitment to the law push the administrator to practice guerrilla government.

The public administrator's commitment to the law does not allow the bureaucrat to act outside of professional values, constitutional requirements, and ethics because she is given orders. In other words, the public administrator cannot hide behind the *Nuremberg Defense* of simply following orders (Shafritz et al. 2015). The ethical codes of professions offer guidance. For instance, the ethical code of public administration focuses on a need for democratic values in public bureaucracies (Stewart 1985). Such a code is another part of professional bureaucracy and the morality of serving democratic values. However, many public managers hold to a strict view of the need for apolitical administration may view the issue of morality in public administration as a question that undermines the democratic process. To these managers, elected officials determine the morality of government as the people's representatives picked through the ballot box. Still, this runs the risk of being put in a situation where one is merely following orders. Stewart (1985) discussed how public administrators need to view themselves as "ethical agents." Accordingly, public administrators have an "ethic of dissent" obligation to ensure that their work follows the professionalism of the field and democratic values (O'Leary 2013; Newswander 2015).

The practical features of such administrative behavior need to be explored., Is such dissent an act that is protected by the legal framework of a nation? In the U.S., the Supreme Court has ruled that public servants have First Amendment protections that allow them to speak out against wrongdoing in government or to express political opinions (Newswander 2015). For instance, in *Rankin v. McPherson (1987),* the Supreme Court ruled that a public employee was wrongly fired for a disapproving comment about President Ronald Reagan surviving the attempt made on his life (Rosenbloom et al. 2004).

Public administrators are citizens as well as bureaucrats. In their role as citizens, public administrators can serve as "guerrilla statesmen" by speaking out, even at times against political superiors, to help the public understand public policy decisions (Newswander 2015, p. 126). Still, guerrilla statesmanship is reserved for hopefully rare situations in government where the public administrator's commitment to constitutional requirements and ethics supersedes actions from political agents.

## Guidance for Public Administrators

The public administrator's commitment to the law is not a simple administrative issue. In a democracy, public administrators ideally follow the wishes of their political superiors, but what happens when those wishes violate key constitutional principles, such as freedom of speech, unreasonable search and seizures, and freedoms of the press to name just a few. In such situations, practicing public managers look to scholarship to

provide guidance and answers. The following guidelines may help.

- First, public agencies exist to implement the policy of elected institutions (Moe and Gilmour 1995). Nevertheless, public administrators are legally and ethically responsible for their actions. Given this, there are times that public administrators have a responsibility to practice ethical dissent.
- Second, public administrators have a duty to follow their constitutional framework and democratic values. Ideally, political superiors also have such responsibilities. However, in the situations where they may not, public administrators are citizens and have depending on their nation constitutional protections to ensure democratic values.
- Lastly, the professional norms and values of public administration serve as an excellent guide to help public administrators understand their commitment to the law. Furthermore, the ability to listen well to the public and also other stakeholders aid in ensuring that public administrators are balancing democratic accountability and administrative effectiveness (Stivers 1994). In the end, public administrators have a responsibility to both.

## Conclusion

The public administrators' commitment to the law is rooted in their commitment to the legal framework of their nation. This commitment at times can be an administrative challenge of balancing ethics, professional accountability, and politics for the public administrator. When democratic values are expressed in a nation's legal framework, then the public administrators' commitment to the law is their commitment to democracy.

# Law as a Source of Democratic Principles and Public Administration

Alison Staudinger
University of Wisconsin-Green Bay, Green Bay, WI, USA

## Synonyms

Government by the people; Legal and political accountability; Popular sovereignty and the rule of law

## Definition

Countermajoritarian Difficulty: The concern that legal branches will overturn laws passed by democratically elected officials.

Judicial Review: The ability of courts to examine whether laws or policies are in accordance with a state's constitutional or legal framework.

Rights-Bearing: The notion that citizens or humans are entitled to make certain claims against the government because of their status.

## Introduction

A central question for legal theorists is whether law and politics are distinct domains, standing independent from one another, or bear a more complex relationship. This matters for the possibility of law serving to create, regulate, or maintain democratic processes, institutions, and habits of citizenship. Those who see law and legal norms as only a particular form of politics may doubt that legal norms, even ones that purport to be democratic, have much force if democratic norms and institutions outside of the law do not support them. This approach is briefly discussed, but the bulk of this entry concerns schools and thinkers who understand law and legal norms to be at least someone district and thus for law to have productive and institutional effects. Even for those who understand law and politics as separate, or as at least distinct in some important but potentially overlapping ways, conceive of the possibility of law's influence on democracy in ways ranging from the architecture of a constitutional regime to theoretical underpinnings of the rule of law to procedural democracy and even practices of citizenship. Finally, the meaning of market-based reforms in the practice of public administration as well as late capitalism itself makes the possibilities of overcoming democratic deficits even more difficult.

## Law as Politics by Other Means

The idea that law serves to protect democratic principles can result from a natural law conception that sees positive law as an attempt to reflect and protect fundamental rights given by a deity or rooted in humanity or a positivist account of law as the creation of a particular society. In either case, law is generally understood as forming a distinct domain where norms, standards, and practices differ from those in other branches or spheres of life. But there are other ways to understand law, many of which evolved from the position of twentieth century legal realism, which analyzed the law in its social context. Critical legal studies (CLS), for example, explains law as a function of society's power structures, often focusing on class, race, and gender. Law is understood as maintaining or producing these hierarchies, while appearing to promote neutral or liberal values, which CLS scholars often critique as inherently contradictory or dependent on exclusions. Behaviorist approaches within political science also see law as politics by other means, although they tend to study judicial decision-making in relation to the preferences of judicial actors, public opinion, and power *as well as* the obviously legal sources of precedent, rules, statutes, and legislation. Neither school equates law and politics directly, in the sense that both recognize and analyze the way in which legal language, norms, and institutions privilege certain outcomes, which may themselves be politically enforced. However, both raise interesting questions about the work that law does for or in democracy.

CLS scholars, although diverse, tend to be skeptical about claims that law or legal norms serve to advance democratic values like contestation, equality, accountability, and rule of law. For example, some CLS and other authors have advanced a "critique of rights" which seeks to understand the meaning and limitations of the contemporary use of "rights talk" to express citizen claims against the state (Kennedy 1998). The argument is that rights, which seemingly increase the possibilities of genuine democracy and justice, instead limit this development in their insistence on individualized protections which occlude possible relations of dominance contained within them, as the notion of private property rights does. Or they may be that a right established in one area fits uneasily into another context. Rights

may also, despite their theoretical universality, be less accessible for citizens of different nations or statuses within nations. For example, the 1936 constitution, also known as the Stalin Constitution, recognized extensive civil rights for individuals and even protected religious and ethnic minorities; in reality, these rights were frequently abrogated by the state. The recognition of a right in court may even harm the people it purports to help, as in the United States where the "right to counsel" recognized in the US Supreme Court ruling in *Gideon v. Wainwright* (1962). Although people generally believe that they have the right to counsel, lack of funding means that many of the indigent accused wait for months, sometimes in jail, for representation. In this reading, the seemingly democratic legal guarantee of "rights" is in fact serving as ideological cover for inequality and oppression.

For those who study judicial behavior, the democratic capacity of law is more likely to be understood in relation to how judges make choices in relation to public opinion, which is a proxy for democratic voice. The dominant models of judicial behaviorism – strategic and attitudinal – look to see how judges act in relation to their goals and policy preferences (Segal and Spaeth 2002). This is problematic for democracy, because it suggests that legal decision-making, which is often protected from the accountability pressures that elections provide for other officials, may be reflecting the members of a court and their political preferences more than any overarching legal vision. Or they may use their opinions to strategically communicate their political and legal vision (Baum 2008; Friedman 2009). However, judicial behavior may also, as argues, reflect dominant public opinion, and thus escape this trap. In the case of an international court with members from more than one nation state, judicial behaviorist might ask whether court members favor their home nation in their decision-making; while this might be a cause for critique of the impartiality of law, it could also mean a sort of accountability – or mere chauvinism. Judicial behaviorists may be thus skeptical of the role of law in democracy or view it as question of responsiveness to public opinion.

## Law as Source for Democratic Institutions

Legal rules and procedures, whether constitutional or administrative, certainly shape the institutions, norms, and agendas of other parts of public administration often seen as more political or bureaucratic. Most glaring are the ways that constitutions, written or unwritten, contain commitments to democratic principles such as rights, equality, separation of powers, popular sovereignty, and due process. All of these can be illustrated through the South African constitution of 1997. This document views citizens and humans as rights-bearing subjects, codifying these rights ranging from political rights to speech and assembly, through civil rights like education and those afforded the accused, and onto economic rights to housing, to unionization and the unique right to choose a profession. Citizens thus emerge as sovereign and with inherent claims on the state; indeed, a famous clause notes that these rights can only be limited when reasonable in "an open and democratic society based on human dignity, equality and freedom." The notion of equality is explicit in this constitution, which protects a long list of prohibited grounds for discrimination and follows the German Constitution of 1949's commitment to "human dignity" as a core principle.

As with many constitutions, South Africa's creates a structure of government where there is cooperation and competition both within a federal structure, national, provincial, and local, and between branches, legislative, judicial, and executive. It also adds a special set of institutions in Section Nine explicitly charged with protecting democracy and human rights. While the US Constitution's invocation of "we the people" is perhaps the most famous constructional nod to popular sovereignty, or the idea that governments are legitimated by the consent of the people, the South African constitution reflects this idea both in commitments to public access to the legislative body *and* to the civil service and other parts of public administration. Finally, these broad commitments to democratic equality and access are substantiated by guarantees of due process should they be abrogated.

Similar guarantees exist in many constitutions around the world, although, as in South Africa, all of these democratic constitutional commitments do not always exist outside of paper. Indeed, sometimes the role of public law in relation to democracy is to thwart it, especially as lawmakers and judicial actors attempt to manage supranational development. For example, the Committee of Permanent Representatives in the European Union (COREPER) is established by treaty and composed mainly of member state ambassadors. COREPER is quite powerful, and yet its members are not elected and its role is not publically prominent. This is one of the many aspects of the European Union that have prompted calls to mend a "democratic deficit" as well as the possibility of member state exist in search of sovereignty. Indeed, the very notion of constitution law as "higher" than everyday legislation and statute is a notion with a complex relationship to democracy. On one hand, it reflects the idea that constitutions contain the core democratic principles of a social contract between citizens, but on the other it can potentially supersede the decisions of democratically elected officials or citizens themselves. In the United States, the constitution guarantee of freedom of speech has been used to invalidate campaign finance laws passed by a democratically elected Congress and supported by the public.

## Rule of Law and Citizenship

Rule of law is the legal concept most directly associated with democracy and democratization. The notion that governments are "of laws and not of men" is at the heart of the idea of public law itself, which purports to govern how states and citizens interact in a common attempt to promote the public good. Rule of law is seen as essential to democracy, because it provides a set of public rules that apply to everyone and demands a fair administration process, both for bureaucracies and judiciaries. The concept of "equality before the law" is deeply democratic and is promoted by entities like the United Nations who seek democratization and considered an essential element of a democratic state in measurements of democracy.

Public law provides the basic requirements, duties, and rights of citizens and frames the possibilities for their civic participation and education. For example, Alexis de Tocqueville et al. ([1840] 2002) considered juries of the United States to be a key institution that promoted civic engagement and taught democratic life because citizens would learn about the law and how to use it, and because classes would mix. While Tocqueville identified the jury as a place where citizens could be politically educated and substantively experience equality, we also might think of the practices of initiative and referendum. For example, citizens in some subnational or subregional entities, like Catalonia, Quebec or Scotland, can vote on their membership in a state or regional union. This reinforces the notion that the people control political membership and that self-determination is central to international law. Similarly, some states or subnational units allow for citizens to either directly propose law and then put it up to the people for ratifications, or allow, as in Switzerland, veto power by citizens when a significant amount of citizens or cantons call for a popular vote.

Although democracy and bureaucracy are sometimes considered in opposition, similar possibilities for civic learning exist within these systems as well; for example, Fung and Wright (2003) argue that there can be democratic participation in sites that are neither fully part of the state or private spaces. They explore how Porte Alegre's experiment with participatory budgeting functioned in tandem with the bureaucracy and in fact helped create a more streamlined and certainly more public administration. Given the importance of bureaucracy in modern welfare states and those with large regulatory apparatuses, the bureaucracy may continue to develop as a site for democratic innovation.

## Judicial Review as a Threat to Democracy

Judicial review is a standard feature of contemporary public law, although it functions different in different contexts, particularly depending on whether the state has common law elements.

However, its general purpose is to empower the courts to interpret the actions and legislation of other government actors to determine whether they accord with constitutionally or other legal sources, and in these cases overturn the law or propose another remedy. The ability of courts to strike down the decisions of democratically elected officials, as noted above, can be problematic, especially as many judges, particularly at the highest levels, are not themselves elected nor, often, do they serve for set terms. We might worry that this causes a "countermajoritarian difficulty" because a judicial minority overturns the will of the people as expressed in legislation or executive action (Bickel 1986). For example, the ruling by the European Court of Justice which required Google to respond to some takedown notices from users who wanted to invoke "the right to be forgotten," while exciting for privacy advocates, was a decision by an unelected court in Europe directed at a US corporation; could it be said to be democratic? And, as noted above, courts may overturn popular pieces of legislation, like campaign finance reform. They may also overturn the directly expressed voice of the people, as in the cases in the United States where, despite a popular vote to ban it, marriage equality for same-sex couples was judicially established. One way to solve the problem of the countermajoritarian difficulty is to view courts as "representation-reinforcing" when they act to insure access to the political process (Ely 1980). Or, perhaps courts are empowered to overturn laws because it allows them to protect "discrete and insular minorities" as noted in a famous footnote in US Constitutional history in *United States v. Carolene Products Co*. (1938). An alternative conceptualization follows Bruce Ackerman (1993), who distinguishes between "normal" and "constitutional" politics, the latter occurring at moments of great popular excitement and democratic empowerment of executive and judicial actors; as long as the courts attend to these moments, they are acting democratically.

This problem plagues countries most acutely when, as in the United States, who have a very strong form of judicial review called judicial supremacy, which views the highest appeals court as one of "last resort" and as the last work on the constitutionality of any law. Other countries, particularly civil law countries, tend to prefer legislative supremacy and often, as in the United Kingdom, exclude the ability of courts to strike down legislation. And in states that have a specialized system of judicial review where a constitutional court is solely enable to strike down primary legislation, often called the Austrian system because of its author, Hans Kelsen. In these systems, other (more democratic) branches share a certain degree of responsibility for answering constitutional questions, thus alleviating some of the pressure.

## Conclusion

In this entry, law as a source for democratic principles and public administration has been treated primarily in relation to a minimal conception of democracy as a system of limited government with regular and fair elections. Although hinted at through the discussion of equality and rights as core democratic values, democracy is arguably not merely about the aggregative functions of elections as an expression of popular sovereignty. As in the example of citizenship above, participatory theories of democracy might look to how law facilitates or frames the activities of the people, perhaps through their capacity for free speech and assembly. Advocates for deliberation in democratic states might look for institutional structures that allow for extended and thoughtful wrestling by officials, citizens, or by both on new policies, such as requirements for public hearings. Those who favor a more agonistic and combative democracy through which citizen's advance their normative commitments might look for how pluralistic legal systems are. If democracy is broadly understood, citizens may better be able to address difficulties, whether countermajoritarian or in the shape of bureaucratic institutions, moving forward.

Despite the potential for public law to serve as a source for democratic principles, the tension between these principles and public law is still great. Dwight Waldo ([1948] 2006) argued that

this problem was deep-seated and only likely to be addressed in piecemeal fashion. The turn in public administration to the new public management model that draws on organizational theory and the language and procedures of private business may continue to make this difficult; for example, the notion that citizens are "clients" to be served by the state is a strikingly different conceptualization of this relationship from one of the sovereign and empowered citizen. Seeking to democratize public administration through the legal process can only occur if the democratic norms and processes outside the legal process are opened to this. As governance increasingly outstrips state borders and responds to the power of multinational corporations specifically and market forces more generally, the need for new outlets for civic engagement are many. However, the legal tools for guaranteeing these access points, such as rights and public opinion, are difficult to deploy in the world of public administration without falling back into a model of clients rather than citizens.

# Law Constraints on Public Administration

Craig Curtis
Bradley University, Peoria, IL, USA

## Synonyms

Bureaucracy; Public bureaucracy; Public management; Public organizations; Public sector

L

## Definition

Public administration consists of the organizations, procedures, rules, and budgets employed to provide public goods and services.

## Introduction

Careerists who work in public sector agencies are often faced with situations wherein the main question is not what to do or even how to go about implementing a law. Rather the question is does the law allow me to do what I want, and perhaps need, to do. Managers at all levels of federal, state, and local bureaucracies must comply with the federal and state constitutions as well as laws that are enacted by legislative bodies and rules created by administrative agencies. It is complex and constraining.

This chapter will attempt to detail the main constraints faced by public sector managers. The chapter will be organized according to a legal hierarchy that starts with the Federal Constitution and continues downward to local ordinances. Of

necessity, variations in state and local laws will not be detailed as that would be far beyond the scope of this work. Rather, where there is the potential for local or state variation, that potential will be identified so that the reader can do the necessary research.

## The US Constitution

### The Constitution and Equal Protection

All discussions of the constraints on actions by governments must start with the US Constitution. Much of what is detailed in both the body of the document and the amendments is concerned with what things governments may not do. For example, Article I, Section 10, is concerned with a list of things that states, and by extension, local governments, may not do, including a prohibition against passing bills of attainder and ex post facto laws. Perhaps more importantly, the Bill of Rights has a long list of things that governments may not do, including a prohibition on unreasonable searches and seizures, protections against regulating political speech, and protections for religious freedom of expression.

The body of the Constitution, the Fifth Amendment, and the Fourteenth Amendment together work to prohibit discrimination based on race, gender, sexual orientation, ethnic origin, and other categories that the courts grant some sort of protected status. In the simplest terms, whenever the government treats someone differently than another person because of some characteristic of the person as opposed to their behavior, it has to have a valid reason to do so. The reason required depends on the nature of the reason for the differential treatment.

Some types of different treatment, such as race, require that the government meet a very high burden before they can justify the differential treatment. The courts use the term "strict scrutiny" to refer to this standard of review. Under this standard, the government must prove that the discrimination is justified by a compelling government interest and that the policy is the least restrictive way to achieve this compelling government interest. In practical terms, this almost always means that the government loses the lawsuit. Recent cases on the issue of affirmative action in university admission policies (*Gratz v. Bollinger* 2003; *Grutter v. Bollinger* 2003) ruled that diversity can be a compelling government interest, but the procedures that can be legally used to achieve that diversity are very limited. Any quota or numerical ranking system will fail the test. For purposes of hiring or promotion decisions, this means that almost any selection system that grants preferential treatment to an applicant based on their race will likely fail if challenged in court.

Many forms of discrimination require only that the government show a rational relationship to a legitimate government interest. This is a very lenient standard and the government almost always wins such lawsuits. This type of "ordinary scrutiny" or "rational basis" scrutiny is applied to all cases unless there is some reason not to apply it, such as the existence of a suspect classification, such as race, or a quasi-suspect classification, such as gender.

A special type of equal protection analysis is prescribed for cases of gender discrimination. What is required is that the government shows a substantial relationship to an important government interest. What this actually means is pretty unclear, except that the standard that the government must meet is higher than rational basis and less than strict scrutiny.

What this all means for the public sector manager is that whenever a policy treats someone differently than another person because of that person's status, religion, or physical characteristics, there must be a legally valid reason for doing so. What reason is required depends on the nature of the classification. This may seem unclear, but there is a large body of case law, federal statutes, and federal regulations that provide detailed guidance for particular issues.

### The Constitution and Due Process

The Fifth and Fourteenth Amendments both mandate that protected constitutional interests, such as life, liberty, and property, may not be taken away by the government without notice and due process of law. In effect, this means that you can't take

away a protected thing, such as a tenured public sector job, without having a good reason and without providing the person an opportunity to say why the reason is not valid.

Any large bureaucracy must deal with the fact that their own employees, and prospective employees, may sue them whenever employment or promotion is denied or disciplinary action is taken. Most personnel manuals and collective bargaining agreements provide for a set of agreed-upon procedures when there is a difference of opinion concerning the validity of a personnel action. Often, there is an agency that is charged with hearing these disputes. At the federal level, it is the Merit Systems Protection Board (MSPB), created by the Civil Service Reform Act of 1978. This body hears thousands of cases each year, 28,509 cases in 2015 alone (United States Merit Systems Protection Board 2016). States have their own hearing bodies, with some providing far more protections to employees than others. Managers must heed the rules and procedures set out in personnel manuals as failure to follow proper procedure will often result in a reversal of the adverse action by one of these hearing bodies.

There is a huge amount of case law on what constitutes due process in the personnel arena, and smart lawyers are skilled at alleging that whatever process that is provided is not sufficient. The public sector manager who is faced with such an attorney must hope that the personnel manual or collective bargaining agreement is sufficiently detailed and precisely written as it applies to the situation in question.

The dispute over the extent to which civil service protections apply to protect workers lies at the heart of the political battle over the future of public sector trade unions. Critics of public sector unions assert that the extent to which civil service protections and collective bargaining provisions protect workers from discipline or dismissal serves to render the public bureaucracies rigid and unresponsive to political control. These assertions go so far as to opine that the system serves to insure mediocrity as there is no effective way to get rid of poor performers or improve the work of mediocre performers without running afoul of civil service rules. Proponents argue that civil service rules serve to protect the politically neutral competence of the bureaucracy in that public sector workers who take principled stands are protected from retaliation for doing so. Additionally, these civil service rules serve to protect important values such as equal protection of the laws and rationality in decision making. In essence, one can argue that there are competing pressures in the public sector and that politically neutral competence and political accountability are two values in constant flux and tension in the public sector.

## Specific Issues of Federal Law

### Affirmative Action and Anti-discrimination Statutes

Executive order 10,925, issued by President Kennedy on March 1, 1961, used the phrase "affirmative action" to refer to the mandate that federal agencies and contractors aggressively enforce his anti-discrimination policies. This phrase came to mean that special preferences would be granted to historically disadvantaged groups as a way to counter the continuing adverse effects of past overt discrimination against those groups. By the mid-1970s, large numbers of public sector organizations had affirmative action plans in place, often as a result of a court order or consent decree. These plans sometimes included racial quotas.

The 1978 decision in *Regents of the University of California v. Bakke* was a landmark in that it was the first victory for those plaintiffs alleging that they were the victims of reverse discrimination. For the next decade plus, the courts struggled with the legal standard to be applied to such cases. Ultimately, the Supreme Court issued the decision in *Adarand Constructors v. Pena* in 1995, which established the "Color Blind" approach to such cases under which cases of racial discrimination were decided using the standard of strict scrutiny regardless of whether the discrimination was invidious or benign. Over time, affirmative action plans have become so difficult to justify in the public sector that the Equal Employment Opportunity compliance amounts to little more than a statement on the job announcement that the employer is an EEO employer and the gathering

of survey data from job applicants. No quotas exist and any hiring criterion that assigns points based on race is easily defeated when challenged. While it is technically possible for an affirmative action plan to survive strict scrutiny, no plan that directly affects numerical selection criteria can survive legal challenge.

This does not mean that a manager may use an improper decision criterion, such as race or ethnicity, in making a personnel decision. Anti-discrimination statutes are still in place at the federal and state levels and must be followed. While the use of a selection criterion such as a score on a civil service exam would seem, at first glance, to be neutral with regard to race or ethnicity, such instruments can easily have a disparate impact on historically disadvantaged groups. If that is the case, careful attention must be paid to validation of the instrument. Even if there is a disparate impact, successful defense of any lawsuits is still possible if the instrument measures bona fide occupation qualifications and has been properly validated by an expert in the field.

### Sexual Orientation

The 2015 decision in *Obergefell v. Hodges* pretty much removed all doubt regarding the issue of whether a public sector organization could overtly discriminate against people on the basis of sexual orientation. While covert and de facto discrimination certainly still exists in many communities, any overt discrimination would easily be struck down in any federal court.

The treatment of those who are transgendered, who are nonconforming (TGNC), or who reject the traditional notions of gender altogether is less certain. As of 2016, the military was grappling with the issue of how to treat those who do not identify with their birth gender. In 2012, the decision in *Macey v. Holder* established that discrimination against the transgendered constituted gender discrimination under the Civil Rights Act of 1964 Macey v. Holder (2012). In 2013, the Social Security Administration made it far easier for TGNC persons to change their official records. In 2014, the Obama Administration began issuing regulations that sought to protect the TGNC from discrimination. Schools were informed that transgendered students would gain protection under Title IX of the Civil Rights Act of 1972, and provision was made for TGNC veterans seeking treatment in the VA. In the federal civilian bureaucracy, the transgendered are entitled to be treated with respect and dignity. They must be called by their preferred names and pronouns and have access to restrooms and locker rooms that are appropriate to their gender identity. Any regulations or executive orders issued by the Obama Administration can be reversed by future presidents, so even some of these protections could be temporary.

In the various states, it is not at all clear that the transgendered will gain the kind of protection they have if they work in the federal bureaucracy. A minority of states provide for protection for the TGNC, but many states and local governments do not. There is an ongoing effort by interest groups such as Lambda Legal, but popular resistance to such efforts are still strong in many of the more religiously conservative areas of the country, including ordinances and statutes that are purposely intended to prevent special treatment for the TGNC.

### Sexual Harassment

Sexual Harassment is a form of gender discrimination and has been considered so since the Equal Employment Opportunity Commission issued regulations to that effect in 1980. These regulations were given the official sanction of the courts in *Meritor Saving Bank v. Vinson* (1986). Sexual harassment comes in two varieties: quid pro quo and hostile environment. Quid pro quo sexual harassment involves the trading of sexual favors for advantages on the job. Hostile environment sexual harassment, a much more common problem, is much harder to pin down.

Where there is behavior that is both "unwelcome" and "sexual in nature," the potential exists for a claim of hostile environment sexual harassment. The concept of "unwelcome" is somewhat subjective and may require that the person engaging in the behavior be put on actual notice that the behavior is unwelcome. Some behavior is so egregious that the courts have determined that no actual notice need be proved

in order to win in court on the basis that any rational person would know that the behavior is unwelcome. In the *Meritor Savings Bank* case, the behavior included forcible rape, which was determined to be of such nature that no actual notice was required.

Sexual harassment need not be between people of different genders. With the growing acceptance of gay marriage and the increasing prevalence and openness of gay and TGNC persons, it is likely that local and state governments will need to be more alert to the potential for conflict between employees. When the supervisor is ideologically conservative and the employee is lesbian, gay, bisexual, or transgendered, nonconforming (LGBT), the potential for such claims is greater. Departments that are more traditionally gendered, such as policing, are the most likely spots for these kinds of problems.

## Unions

While the initial emergence of the right to collectively bargain in the New Deal did not extend to the public sector for some decades, by the 1970s, public sector unions were growing in strength and would quickly outstrip the private sector in terms of percentages of covered workers as private sector unions declined in numbers and influence. In the federal sector, collective bargaining was first allowed by executive order under President Kennedy and later under the authority of the Civil Service Reform of 1978.

When a work unit is organized, there is a legal obligation to collectively bargain in good faith. Some aspects of the work are not bargained. For example, where salary is determined legislatively, as in the federal practice, there is no bargaining over wages. Negotiations are limited to conditions of work. Where salary is not determined legislatively, public sector employers must bargain over wages as well as conditions of work.

Very few public sector employees have a right to strike, and many are forbidden to do so. In such cases, when a strike does occur, the settlement must include some sort of accommodation, such as a grant of immunity from prosecution for engaging in an illegal strike. Of course, as President Reagan established in his dealings with the Professional Air Traffic Controllers Organization in the early 1980s, in case of an illegal strike, the public sector employer may decertify the union and dismiss all striking workers and replace them.

The right to collectively bargain is not evenly available in all states. Many states now are "right to work" states, meaning that no one can be forced to join a union or pay union dues as a condition of work. Some public sector workers simply are denied the right to engage in collective bargaining. For example, firefighters and police officers in North and South Carolina are denied the right to engage in collective bargaining. Teachers in Georgia and Texas may not collectively bargain (Sanes and Schmitt 2014). In Wisconsin, collective bargaining rights for many workers, but not police and firefighters, were severely constrained after Governor Scott Walker successfully pushed a right to work law through the state legislature in 2011.

The growing political clout of the Tea Party in terms of their ability to elect their members to key positions increases the tension between management and labor in the public sector. While the trade union movement has significantly declined in the private sector over the last decade, public sector unions in parts of the industrial Midwest and the coasts have managed to maintain positions of relative strength. The election of several highly conservative governors in the 2010s, most famously Scott Walker in Wisconsin, has resulted in significant losses of union protections in those states. Issues surrounding the continuing power of unions have resulted in major political conflict in a number of Midwestern states. The results have varied, but most of these conflicts resulted in losses of political power for public sector unions.

One of the ways in which the battle over the viability of public sector unions has played out has to do with the ability of unions to collect "fair share" dues from employees who work in a unionized work unit but who are not members of the union. The 1977 case of *Abood v. Detroit Board of Education* held that nonunion workers who worked in a work unit that was represented by a union would have to pay "fair share" dues, which would be defined as the percentage of the full union dues that are used solely on collective

bargaining activities. The percentage of union dues used to further political activities is excluded from the "fair share." Public sector unions have to keep careful records of their expenditures to justify these "fair share" dues.

The case of *Friedrichs v. California Teachers Union* involved a direct challenge to the concept of fair share dues. While the case was pending in the spring of 2016, Justice Antonin Scalia died of a heart attack leaving the Supreme Court evenly divided on the issue. As a result, the Ninth Circuit decision in favor of the union remained in effect, but the larger issue remains a live one. The end of fair share dues would result in the loss of many millions of dollars in revenue for public sector unions in the 23 states where such arrangements are allowed. In the federal practice, "fair share" dues are not allowed.

### Freedom of Expression

There has long been an issue with just how much one's freedom of speech and religious expression are relinquished when one takes a job in the public sector. The passage of the federal Hatch Act in 1939 restricted the ability of federal workers to hold elective office or to engage in political campaign activity. In the aftermath of the passage of the Hatch Act, states and local governments passed similar acts, often called "little" Hatch Acts.

Over time the Hatch Act has been amended, most recently in 2012, to allow for greater freedom for employees to be active in party politics, so long as they maintain strict separation between the work and their political activity. Employees subject to Hatch Acts typically cannot hold elective office in their government but can engage in all sorts of political activity during their personal time.

Demands that a public employer accommodate the religious expression preferences of employees can create issues. For example, where uniform standards and dress codes of a particular religion conflict, the courts have often come down on the side of upholding uniform standards. For example, the Supreme Court upheld an air force decision to forbid one of its officers to wear a yarmulke under his uniform cap in the case of *Goldman v. Weinberger* (1986). More recently, a few police departments have allowed Sikh officers to wear their long hair, beards, and turbans, and even the military has relented in this regard.

After *Obergefell v. Hodges* (2015) was decided, Rowan County, Kentucky, Clerk Kim Davis refused to grant marriage licenses to gay couples on religious grounds. Her refusal illustrates how sincerely held religious belief can affect the way that a public sector employee behaves at work. The courts had little trouble in holding that her religious views do not allow her to unilaterally ignore the Supreme Court, but the issue of how a government might accommodate an employee with genuine religious objections to carrying out a policy if there is a reasonable way to allow the law to be enforced and respect the employees' beliefs remains a live one.

## Privacy Rights and Workplace Searches

In contrast to the virtually unlimited right of a private sector employer to search the work places and persons of an employee, the public sector employer needs justification to search the workplace and person of an employee. That is because a search by a public sector employer constitutes state action within the meaning of the Constitution. Thus, a drug test is a search of the person of an employee. The law on drug testing is pretty well settled in the aftermath of two key Supreme Court cases from 1989, *Skinner v. Railway Labor Executives' Association* and *National Treasury Employees v. Von Raab* (1989). Public sector employers may drug test an employee if they have individualized suspicion of drug use, if the employee has law enforcement duties, if the employee carries a gun or operates any potentially dangerous equipment, or if the job has national security implications.

Searches of workplaces, including computers or other digital devices, by public sector employers is based on a reasonableness standard that was established in *O'Connor v. Ortega* (1987). So long as the intrusion is balanced by the government interest, or if there is an administrative warrant, the search will be allowed. With regard to computers, it is important that the

employer have a clearly defined privacy policy with regard to ownership of digital data and devices. So long as the personnel manual has a clearly stated policy that the digital device is the property of the employer and that any data stored on the device, or in a cloud accessible from the device, are also owned by the agency, then there should be little limit to the ability of the employer to access the devices and data.

In the absence of a clearly stated policy that all digital devices are the property of the employer, and if there are practices in place in the workplace that allow an employee greater control over his or her devices, such as allowing the use of encryption without mandating that the employer have access to the encryption keys, or allowing the device to be used for both personal and work uses, doubts could be raised about the ability of the employer to access such information.

## Statutory Compliance
